The committee on power interlocking presented specifications for incandescent lamps and for the installation of vitrified clay conduit systems. Progress was reported in the preparation of typical circuit plans for electric interlocking and in the investigation of the energy required for operating and holding signals. The report on the use of 30 volts or less for the control of electric interlocking apparatus as published in the June issue of the *Journal* of the Railway Signal Association was recommended for submission to the association by letter ballot. The standing committee on storage battery and charging equipment also presented several specifications and plans covering material required in connection with storage-battery work, and the committee on standard designs, signal symbols and nomenclature presented a number of drawings.

The latter committee's report stated that the return of the letter ballot of last year on the color of signal blades was inconclusive, recommending that a new ballot be submitted to provide a definite opportunity for decision between two color schemes for three-position signal blades. These suggested color schemes were red with a white stripe and yellow with a black stripe. The committee presented also an extended nomenclature for use with plans and apparatus.

The committee on automatic block submitted specifications for a primary battery and for a d.c. vibrating highway crossing bell, and reported progress on several other matters. A minority report of one of the subcommittees of this standing committee was also submitted. This minority report covered the matter of typical circuit plans for automatic block signals on single-track roads, and the sub-committee offered the following requisites for the circuits: Signals should be so located as to provide adequate spacing and head-on protection; and the control of signals should provide, 1, positive block indications against opposing trains between sidings; 2, stop, caution or clear indications for following movements, as on double track; 3, that two trains meeting at a passing siding shall each first receive a caution indication; 4, protection for switches and switching movements, as on double track; 5, protection against single crosses and any number of grounds causing false clear indications; 6, that opposing signals governing the same block shall not display simultaneous proceed indications, authorizing trains to proceed against each other, nor, 7, to move from passing sidings against each other.

The committee stated that to fulfill these requirements it was necessary to provide a larger number of relays and relay contacts than were required under present methods. Such additions were frequently referred to as added complications, but to the sub-committee were known to be added factors of safety, which had not heretofore been used but which would be indispensable in future.

The special committee on signaling requirements of electric railways submitted as information a report showing the aspects and rules that had been adopted by the American Electric Railway Association at its 1913 convention. The committee on subjects and definitions also presented a short list of terms with definitions for the consideration of the association.

PROCEEDINGS

The nineteenth annual convention of the Railway Signal Association, which was held at Bluff Point, N. Y., Sept. 22-24, proved to be the largest and most successful meeting in the history of the association. A total of 433 were in attendance, including 160 guests of the association. The meeting was opened at 10 a. m. on Tuesday, Sept. 22, with an address by F. P. Patenall, president of the association, and this was followed by the report of C. C. Rosenberg, secretary-treasurer. The report of the standing committee on signaling practice, of which an abstract is printed elsewhere, was then submitted. An extended discussion took place regarding the nature of the proposed aspect for instructing a train to take siding at a non-interlocked switch, objection being made to the suggested use of an illuminated sign instead of a standard semaphore arm. This objection, however, was overruled and the aspect as proposed, together with other recommendations of the committee, was approved for submission to the association by letter ballot.

The recommendations of the special committee which submitted proposed standard forms for recording interruptions to traffic by signals were approved, without discussion, for submission to letter ballot, and the reports of the several standing committees on storage-battery and charging equipment, on wires and cables, on power interlocking and on the automatic block, were also approved with minor changes, the report of the committee on lightning protection being referred back to the committee for further consideration and presentation at a later date.

At the session on Wednesday the recommendations of the committee on standard designs were approved for submission to letter ballot. The report of the committee on electric railways and a.c. signaling was also approved, the historical data accompanying the report being accepted as information. In connection with the report of the committee on definitions it was decided that because of the difficulty of obtaining unanimous opinion upon the various terms used in signaling the matter should be held in abeyance for the present time. At this session several amendments to the constitution were also passed.

On Thursday the meeting began with a report from the committee on mechanical interlocking, and a number of drawings for mechanical derail layouts and switches which were submitted were accepted by the association as being good practice. This was followed by a report from the committee on contracts giving a table of points to be assigned to different units used in interlocking plants for the purpose of establishing percentages of cost in joint construction. This table was approved with certain changes in nomenclature. The report of the committee on manual block was then approved and, following this, the report of the special committee on signaling requirements for electric railways was accepted without discussion as information.

At the conclusion of the meeting the result of the election of officers for the ensuing year was announced as follows: For president, T. S. Stevens, Atchison, Topeka & Santa Fé Railway; for second vice-president, C. A. Dunham, Great Northern Railway; for secretary-treasurer, C. C. Rosenberg; for directors, C. W. Parker, Canadian Pacific Railway, J. M. Waldron, Interborough Rapid Transit Company, F. B. Wiegand, Lake Shore & Michigan Southern Railway, and W. N. Manuel, Grand Rapids & Indiana Railway. The new first vice-president, who is W. J. Eck, Southern Railway, was elected as second vice-president a year ago and was advanced in accordance with the custom of the association, without election at this meeting.

The report of the committee on a location for the convention in 1915 recommended Salt Lake City, Utah, and this choice was supported unanimously by the association.

ENTERTAINMENTS

The entertainments provided for delegates and guests constituted a most enjoyable and important part of the meeting. These began with an informal dance on the evening of Monday, Sept. 21. On Tuesday afternoon there was a boat trip on Lake Champlain, and in the evening a mock-trial was held. On Wednesday contests at tennis and croquet were arranged and a golf tournament divided interest with a trip through the famous Au Sable Chasm. In the evening the annual dinner occurred. This was a remarkable success, although it was dry—a condition that by no means extended to exceptional speeches by A. H. Rudd, signal engineer Pennsylvania Railroad; C. S. Sims, vice-president Delaware & Hudson Company and T. S. Stevens, signal engineer Atchison, Topeka & Santa Fé Railroad. F. P. Patenall, retiring president of the association, acted ably as toastmaster. An interesting feature of the banquet was the presentation of a handsome silver loving cup to Mr. Patenall as a token of esteem by his subordinates in the signal department of the Baltimore & Ohio Railroad. The entertainments on Thursday consisted of the annual baseball game in the afternoon between the East and the West, in which the former team was successful, and, in the evening the annual dance. On Friday the delegates left by boat through Lake Champlain and Lake George, stopping for the evening at Fort William Henry, at the south end of the latter lake.

Large Attendance Expected at the Panama Exposition

According to President Charles C. Moore, of the Panama-Pacific International Exposition, the attendance at the San Francisco fair will probably be larger on account of the war. While the war will probably make a reduction in the attendance from Europe, it is believed there will be a larger attendance from South America and the Orient. It is thought also that people from these countries will come to establish business connections with American manufacturers and place orders for goods formerly bought in Europe. Moreover, many Americans who usually visit Europe in the summer will go to San Francisco instead.

Definite assurances have been received from France, Italy, Turkey and Japan that they will make the exhibits originally intended. Holland has added $300,000 to her original appropriation, Italy has ordered work on her building and exhibits rushed and Japan has asked for and received an increase of space. The Argentine Republic has increased its appropriation from $1,250,000 to $1,750,000.

The exposition is said to be 92 per cent ready to-day, and it will open on Feb. 20 as planned.

Taxation Valuations of Iowa Interurban Roads

The forty-third annual report of the executive council of Iowa fixing the taxation valuations as of July 21, 1914, gives the following mileage and taxable value per mile for the interurban roads in the State: Albia Interurban Railway, 10 miles, $2,500; Cedar Rapids & Marion City Railway, 20.97 miles, $8,500; Centerville Light & Traction Company, 7.84 miles, $3,000; Charles City Western Railway, 16.33 miles, $2,000; Davenport & Muscatine Railway, 25.27 miles, $3,000; Fort Dodge, Des Moines & Southern Railway, 117.97 miles, $3,000; Inter-Urban Railway, 64.18 miles, $3,500; Iowa & Illinois Railway, 33.05 miles, $3,700; Iowa Railway & Light Company, 46.38 miles, 3,700; Mason City & Clear Lake Traction Company, 14.16 miles, $4,500; Oskaloosa & Buxton Electric Railway, 2.3 miles, $3,700, and Waterloo, Cedar Falls & Northern Railway, 87.63 miles, $4,500. The total trackage represented amounts to 452.54 miles, with a taxable value of $1,676,301.

The Hamilton (Ont.) Street Railway donated the entire receipts for Sept. 10 to the Patriotic Fund.

War and the Electrical Industry

Abstract from English Paper Showing Effect of War on Tramways in Service and Receipts—Also Articles Describing Current United States Trade, Electrical Opportunities in South America and Slowness of South American Payments

PUBLIC TRANSPORTS AND THE WAR

According to *The Electric Railway and Tramway Journal* of Sept. 4, the full effects of the European war upon the public transportation services of the United Kingdom have not made themselves felt, but the tramways were affected during the first epoch of the war. One of the earliest results was the calling from almost every tramway system of a considerable number of motormen and conductors who were reservists or territorials. The effects of this sudden withdrawal of skilled men were naturally serious, but by canceling holiday leave and other obvious steps the managers for the most part kept all, or nearly all, of their services going. As to what may happen when the veteran reserves are called up, no prediction is ventured, but the managers have an eye to this contingency, and will undoubtedly be prepared to keep their cars moving.

In regard to traffic the paper says:

"So far the effects of the war upon tramway traffic have not been very serious, largely owing to the fact that a large proportion of the population has refrained from going to the seaside, and has spent its holidays at home, to some extent taking rides on the cars. As the usual holiday season declines, however, this influence will disappear and in view of all the conditions which obtain we must look forward to lower traffic receipts, with exceptions, perhaps, in the cases of cities or towns where war materials are produced on a large scale."

Of the special services rendered by the tramways to the authorities or to the community since war was declared, nothing is said in detail, but it is stated that the Bradford tramway cars hauled guns up the steep hills which lead out of that city, and in many towns working men were assisted by the extension of the hours during which tickets are issued at special workmen's fares. Many other services were rendered by the cars, while hundreds of motor buses from London and other places were commandeered for military purposes. It is expected that in the near future both these classes of vehicles may be fitted up as ambulances and sick wards.

CURRENT EXPORTS AND IMPORTS

According to the United States Department of Commerce, the exports for August fell off $77,572,475. The total August imports amounted to $110,337,545 as compared to $187,909,020 in August, 1913. For the first eight months of the year the exports were $1,311,319,707 as compared to $1,515,182,137 for the same period last year. The imports, which include raw material used for export goods, decreased from $137,651,553 in August, 1913, to $129,399,496 in August, 1914, a decrease of $8,252,057. For the eight months the figures were $1,156,300,228 for 1913 and $1,269,992,869 for 1914. Some of the import figures are affected by the tariff and not by the war, 61.8 per cent entering free of duty in August this year as compared to 50.9 per cent in August last year.

The Pan-American Union on Sept. 22 issued a statement cautioning American manufacturers against a belief in an immediate market for the sale of products in Latin America. It was stated that South American countries now need financial help, reasonable credits and markets for their raw products, more than American manufactured products and additional shipping facilities. The real Latin American opportunity is one for co-operation, investigation and preparation.

Secretary Redfield, Department of Commerce, has announced that the department will soon place in Rio de Janeiro, Buenos Aires, Santiago and Lima commercial attachés to make extended studies of all the markets. According to Mr. Redfield, the first and foremost need in South America is the re-establishment of her basis of credit. Without this credit merchants and manufacturers in this country cannot afford to sell and without it Latin America cannot buy.

SOUTH AMERICAN CREDITS

MR. MUCHNIC BEFORE PAN-AMERICAN DIPLOMATS EMPHASIZES SLOWNESS OF PAYMENTS AS CAUSE OF POOR CREDIT CONDITIONS IN SOUTH AMERICA

At a conference of Pan-American diplomats recently called in Washington by Secretary of State Bryan, Charles M. Muchnic, in charge of the foreign department, American Locomotive Company, New York, and representative of the National Foreign Trade Council, discussed the general credit condition in South America. Mr. Muchnic stated that as a matter of fact bankers do not generally extend credit in South America to the consumers direct, but rather to the middlemen. These as a rule add to the manufacturers' prices profits ranging from 20 per cent to 200 per cent. These middlemen make no stipulation with the ultimate purchaser as to when his payments are to be made, but rather encourage the accounts to run indefinitely so that the manufacturer who might be desirous of doing business direct with the South American consumer finds himself at a great disadvantage. South American representatives have criticised Americans as always exacting cash payments against documents and as not being willing to extend credit to South American merchants or governmental institutions. Such criticism is not just or correct, because most American manufacturers are more than willing to extend credit to the South American purchasers provided they can be given a reasonable assurance that payments will be made on maturity.

Some years ago Mr. Muchnic made a trip through South America and found in checking up the prices quoted by commission agents with those quoted directly by the American Locomotive Company, that a large discrepancy existed. When he remonstrated with the agents as to the exorbitant commission or profits they added to the regular prices, they invariably stated, "Well, we never know when we are going to get our money, so that we have to add large profits." Not believing such business conditions possible, the company arranged to extend credits to its South American clients on open account. This was done for the last five or six years, and although not a single dollar was lost on the principal of the transactions involved, the company had great difficulty in impressing upon its customers the necessity of meeting their obligations on the due dates. There were cases where payments of $200.000 or $300,000 that had become due were not paid for more than two years after their maturity and it was impossible to collect interest for the time elapsed between the dates payment was due and made. The invariable failure to pay on the due date cost the company many thousands of dollars in interest.

If South American diplomats would impress upon their governmental institutions and their people the desirability of meeting payments on the dates promised or could devise some means whereby they could give some reasonable assurance to American manufacturers that promises of deferred payments would be met on the dates agreed upon, Mr. Muchnic believes that South American countries could get all the credit desired. There is no unwillingness among bankers and manufacturers to grant credit to South Americans provided they can be certain that the obligations incurred will be paid off promptly. British banks in South America refuse to buy any bills of exchange on South America because, they state, they are not certain of being able to collect the amounts due.

SOUTH AMERICAN TRADE SPECIAL

As noted in the ELECTRIC RAILWAY JOURNAL of Sept. 19, the Lehigh Valley Railroad on Sept. 24 started a South American trade special over its lines between New York and Buffalo. The three speakers on the train included Charles M. Pepper, Edward Albes and W. S. Kies. Mr. Pepper, who was for ten years a member of the foreign trade bureau at Washington, spoke of specific markets in South America. Mr. Albes went as the personal representative of Director-General Barrett of the Pan-American Union. Mr. Kies, who is in charge of the South American branches of the National City Bank of New York, discussed the financing of business enterprises with South Americans. Press representatives were invited to make the trip. Meetings, at which there was presented specific information applicable to the main industries of each town, were held at Easton, South Bethlehem, Allentown, Hazleton, Ithaca, Auburn, Geneva, Rochester and Buffalo.

CONDITIONS FOR SUCCESS IN SOUTH AMERICA

MR. KINLEY DISCUSSES NEED OF AMERICAN INVESTMENT IN SOUTH AMERICA AND BEST FIELDS FOR ENDEAVOR

According to a statement made by David Kinley, director of courses in commerce, University of Illinois, to a representative of the ELECTRIC RAILWAY JOURNAL, a considerable proportion of South American exports represents interest on indebtedness. In other words, England, France and Germany have built up their South American trade largely through financing South American enterprises. If the United States is to replace any or all of these countries it must furnish capital to South America. This is particularly true of the west coast, where mineral resources are awaiting a larger development than they have yet had. Mr. Kinley stated that if a group of American manufacturers should advance $50,000,000 for railroad or mining enterprises on this coast they would not send gold to South America. The proper persons in that continent would receive credit for the amount and would then purchase in this country the necessary materials and supplies, paying by drafts on the credits advanced. After the work was under way and successful, they would pay interest and capital from the proceeds of their exports to this and other countries.

Mr. Kinley believes that American manufacturers might build up their trade to a considerable degree without financing South America's projects, but that they could never get the bulk of the business. The more capital South Americans can secure the more they have to sell and the more, therefore, they are able to buy. This process accounts for the great hold of England and Germany in Argentina and Chile. There is a considerable field still open in these countries, but in Mr. Kinley's opinion American manufacturers could have an easier time in Peru, Ecuador or possibly Brazil. There has been, however, asserts Mr. Kinley, too much talk of government initiative in this matter. If any manufacturer in this country is in earnest about developing trade with South America he must proceed on his own initiative, sending responsible agents, meeting South American credit terms, and in general helping to build up what a recent manufacturer called "a network of intelligent agencies."

EXPORT ASSOCIATION LUNCHEON

The American Manufacturers' Export Association held a luncheon at the Whitehall Club, New York, on Sept. 18 to discuss foreign trade conditions. Charles E. Jennings, the president, presided. The first speaker was H. N. Douthitt, special agent of the Department of Commerce, who is soon to go to South America to investigate the trade possibilities for American electrical and other machinery. He said that while American prices were probably a little higher than the prices of European manufacturers, American products had a good reputation in South America and the establishment of markets was only a question of educating the people through branch houses.

Charles M. Muchnic, third vice-president American Locomotive Company, said that in view of the present deplorable financial conditions in South America, American manufacturers should now attempt only to lay the foundation for future returns. Trade with South America should be established on the basis of the quality of the goods. He also discussed some of the points mentioned in his address before the Pan-American diplomats in Washington, outlined in another column. William A. Graham Clarke, commercial agent in charge of the bureau of foreign commerce in New Orleans, discussed the serious conditions arising from the lack of cotton mills to use the raw cotton now without its regular market in Europe. Prof. Guy Edward Snider, of the College of the City of New York, who has just returned from South America, spoke of the acute financial situation there and of the harm done by some American manufacturers in sending goods below sample quality. J. J. Teal, of the Lehigh Valley Railroad, described the plan of that company to send a special train from New York to Buffalo to advertise the possibilities of export trade.

MR. STICHTER ON TEXAS TRADE

B. B. Stichter of Dallas, general manager Southern Traction Company, Dallas, Tex., recently urged Texans to make a campaign to capture the South American trade. "The merchants and business people of Dallas and other large Texas cities," he said, "should band together and come to Galveston and charter a steamer to go and make personal appeals for business. They should go prepared to give facts and figures about what can be expected from this country in the way of trade. The campaign should not stop with the Central American countries, and with the cities along the eastern coast of South America, but the gospel of trade should be carried to the Western cities. Now that the Panama Canal has been opened, there is no reason that Texas should not get her part of the trade from the Pacific part of the country." Concerning conditions reflected by the world conflict. Mr. Stichter declared that if all can hold their own for sixty days there will be a loosening of conditions and the country's business will again be on the boom.

American Association News

Complete Lists of Finance, Exhibits and Entertainment Committee Members and of Exhibitions (to Sept. 15) Are Given Below—A Preliminary Announcement of the Entertainment Plans Is Also Given

COMMITTEES OF THE MANUFACTURERS' ASSOCIATION

The full convention committees of the Manufacturers' Association have just been announced. The several departments of the work are under the general direction of vice-presidents of the association as follows:

FINANCE, Safford S. Colby, vice-president Allen & Peck, Inc.; **EXHIBITS**, Edwin H. Baker, second vice-president Galena Signal Oil Company, New York; **ENTERTAINMENT**, Charles R. Ellicott, assistant Eastern manager Westinghouse Traction Brake Company.

FINANCE COMMITTEE

Wylie Brown, Bridgeport Brass Company, chairman.
C. A. Babtiste, ELECTRIC RAILWAY JOURNAL, New York.
Merrill G. Baker, Cambria Steel Company, Johnstown, Pa.
G. A. Barden, Chicago Pneumatic Tool Company, Philadelphia, Pa.
A. K. Baylor, General Electric Company, New York.
C. P. Billings, Westinghouse Traction Brake Company, Pittsburgh, Pa.
L. L. Brinsmade, Westinghouse Machine Company, New York.
W. A. Brown, Waclark Wire Company, New York.
W. C. Dickerman, American Car & Foundry Company, New York.
S. A. Greer, Rail Joint Company, New York.
H. L. Hawley, Consolidated Car-Heating Company, New York.
Henderson W. Knott, Morgan Crucible Company, Ltd., New York.
C. E. Leach, New York Air Brake Company, New York.
M. A. Oberlander, Western Electric Company, New York.
H. E. Ross, Electric Traction, New York.
J. E. Slimp, Ohio Brass Company, New York.
H. J. Spalding, Aluminum Company of America, New York.
E. J. Waring, Pyrene Manufacturing Company, New York.
R. C. Wilson, Safety Insulated Wire & Cable Company, New York.
W. L. Wright, Wm. Wharton, Jr., & Company, Inc., Philadelphia, Pa.

EXHIBITS COMMITTEE

H. G. McConnaughy, Dearborn Chemical Company, director.
George Arnold, Cleveland Frog & Crossing Company, Cleveland, Ohio.
S. A. Bullock, Baldwin Locomotive Works, Philadelphia, Pa.
S. J. Cotsworth, Lorain Steel Company, Philadelphia, Pa.
N. M. Hench, Carnegie Steel Company, Pittsburgh, Pa.
William M. Henderson, Pennsylvania Steel Company, Steelton, Pa.
T. W. Illingworth, Midvale Steel Company, Philadelphia, Pa.
F. D. Killion, Western Electric Company, New York.
J. A. Kucera, ELECTRIC RAILWAY JOURNAL, New York.
R. C. McCloy, Wm. Wharton, Jr., & Company, Inc., Philadelphia, Pa.
J. R. McFarlin, Electric Service Supplies Company, Philadelphia, Pa.
J. C. McQuiston, Westinghouse Companies, East Pittsburgh, Pa.
Edwin B. Meissner, St. Louis Car Company, St. Louis, Mo.
J. W. Perry, H. W. Johns-Manville Company, New York.
A. L. Price, Ohio Brass Company, Mansfield, Ohio.
F. W. Sargent, American Brake Shoe & Foundry Company, Mahwah, N. J.
L. W. Shugg, General Electric Company, Schenectady, N. Y.
P. C. Snow, Globe Ticket Company, Philadelphia, Pa.
L. H. Snyder, Joseph Dixon Crucible Company, Jersey City, N. J.
Charles H. Thomas, Galena-Signal Oil Company, Franklin, Pa.
S. M. Wilson, The J. G. Brill Company, Philadelphia, Pa.

ENTERTAINMENT COMMITTEE

W. G. Kaylor, Westinghouse Traction Brake Company, chairman.
H. G. Barbee, Maryland Steel Company, Boston, Mass.
C. H. Beck, National Brake & Electric Company, St. Louis, Mo.
Walter Berry, Carnegie Steel Company, New York.
W. L. Boyer, Bemis Car Truck Company, Springfield, Mass.
R. M. Campbell, Detroit Graphite Company, New York.
Charles C. Castle, U. S. Metal & Manufacturing Company, New York.
E. F. Chaffee, O. M. Edwards Company, Syracuse, N. Y.
C. G. Chamberlin, F. W. Devoe & C. T. Raynolds Company, New York.
Thomas Cooper, Westinghouse Electric & Manufacturing Company, Philadelphia, Pa.
W. V. Dee, G. Drouve Company, Bridgeport, Conn.
J. H. Denton, Railway Utility Company, New York.
W. J. Fleming, Automatic Ventilator Company, New York.
N. M. Garland, Ohio Brass Company, New York.
L. E. Gould, ELECTRIC RAILWAY JOURNAL, Chicago, Ill.
F. O. Grayson, Grayson Railway Supply Company, St. Louis, Mo.
Alfred Green, Galena-Signal Oil Company, New York.
A. A. Hale, Griffin Wheel Company, Boston, Mass.
R. F. Hayes, Curtain Supply Company, New York.
H. A. Hegeman, U. S. Metal & Manufacturing Company, New York.
H. H. Helms, Aluminum Company of America, Philadelphia, Pa.
J. M. High, the Pantasote Company, New York.
A. P. Jenks, General Electric Company, Chicago, Ill.
F. E. Johnson, Ohio Brass Company, Chicago, Ill.
P. M. Kling, Laconia Car Company, Boston, Mass.
W. A. Lake, Pantasote Company, New York.
C. W. Laskay, Hale & Kilburn Company, New York.
E. R. Mason, E. R. Mason Company, New York.

T. F. McKenna, Electric Service Supplies Company, Philadelphia, Pa.

H. G. Pearce, Standard Steel Works Company, Philadelphia, Pa.

H. N. Ransom, Westinghouse Electric & Manufacturing Company, New York.

D. A. J. Sullivan, Galena-Signal Oil Company, Kansas City, Mo.

S. W. Trawick, General Electric Company, New York.

W. H. Trubee, Galena-Signal Oil Company, New York.

W. H. Wilkinson, Pressed Steel Car Company, New York.

PLANS OF THE ENTERTAINMENT COMMITTEE

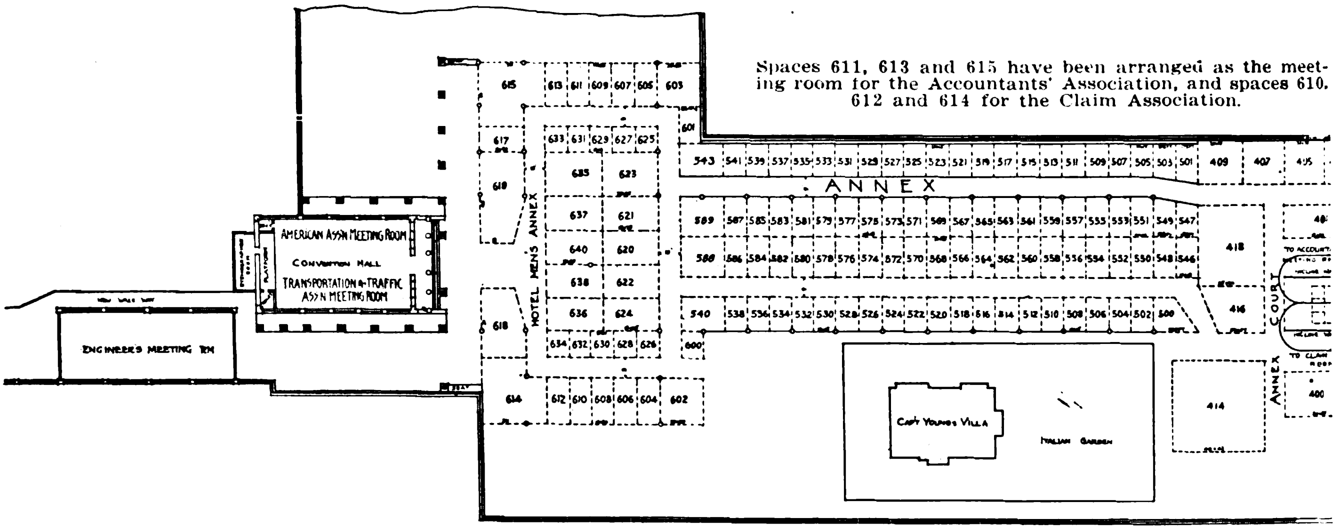
W. G. Kaylor, chairman of the entertainment committee, has announced several of the important features of the entertainment plans for the convention. One of the most novel is a trap shooting contest, which is expected to be an annual affair hereafter. The traps will be placed on the ocean end on the convention pier, and pigeons will be thrown out over the ocean. Prizes will be offered for the highest scores made by experienced contestants and by novices. All persons desiring to participate are requested to bring their own guns, although a few will be provided for the use of the novices. Arrangements have been made to supply contestants with standard trap shooting shells. A practice shoot will be held on Tuesday morning, and the contest will occur on Wednesday afternoon. The shooting should be interesting on account of its spectacular character, and a gallery at the side of the pier will afford a convenient location from which to view the sport. It has been found by test that the noise of the shooting will not interfere with the meetings because the traps will be located at a considerable distance from the hall, and the noise of the ocean will mask the sound of the guns. C. C. Castle, U. S. Metal & Manufacturing Company, is chairman of the sub-committee in charge of the trap shooting.

The entertainment committee has provided for an obstacle golf tournament on the lawn of the Marlborough-Blenheim Hotel. The course, which will comprise nine holes, will be laid out by an expert and will be artistically arranged. Two prizes will be offered for the ladies and two for the men. The chairman of the sub-committee in charge of this tournament is N. M. Garland, Ohio Brass Company.

On Monday evening the annual reception will be held on the convention pier, and it will be followed by informal dancing. On Tuesday evening there will also be informal dancing in the ballroom on the pier. Wednesday evening will be carnival night. There will be a number of special features, among which will be a dancing contest with prizes to be awarded to the leading three couples. This will be open to all members and guests. There will also be a Kee-no dance open to all. On Thursday night the grand ball will occur. On Monday afternoon a concert and dance will be given in Parisian Garden at the entrance lobby of the convention pier. On Tuesday afternoon a ladies' auction bridge tournament will be held in the Parisian Garden, which will be entirely rearranged for the occasion. Prizes will be given as usual for the highest scores. For all of the musical events a twenty-five piece orchestra will be provided.

In addition to the other attractions a skee-ball contest will continue during the entire convention. Five alleys for this sport will be provided in the aquarium court. Prizes will be offered for the highest scores made by men and by women.

The usual free roller-chair service between the hotels and the pier will be furnished.



Spaces 611, 613 and 615 have been arranged as the meeting room for the Accountants' Association, and spaces 610, 612 and 614 for the Claim Association.

PLAN OF OUTER END OF CONVENTION PIER

LIST OF EXHIBITORS AT THE CONVENTION

Following is a list of the exhibitors, with space numbers in parentheses.

Automatic Ventilator Company, (317); Albert & J. M. Anderson Manufacturing Company, (374 and 375); American Steel & Wire Company, (558, 559, 560, 561); American Engineering Company, (12); American Mason Safety Tread Company, (538); American Car & Foundry Company, (619); Atlas Railway Supply Company, (502 and 504); American Brake Shoe & Foundry Company, (416); Edgar Allen American Manganese Steel Company, (500); American Railway Supply Company, (526); Alloy Steel Forging Company, (569); American Lock-Nut Company, (512); S. Abrahams & Company, (323); Auto Utilities Manufacturing Company, (316).

Bemis Car Truck Company, (503); The Brookfield Glass Company, (331); L. S. Brach Supply Company, (141); The Blake Car Step Works, (600); The Buda Company, (311); The J. G. Brill Company, (8); Bayonet Trolley Harp Company, (541).

The Cooper Heater Company, (325); Cleveland Frog & Crossing Company, (585 and 587); Chicago Varnish Company, (574 and 575); Carnegie Steel Company, (546, 547, 548, 549, 550, 551, 552, 553); Chicago Pneumatic Tool Company, (101, 103, 105); The Curtain Supply Company, (638); Columbia Machine Works & Malleable Iron Company, (620); Cheatham Electric Switching Device Company, (159); Consolidated Car-Heating Company, (22); Consolidated Car Fender Company, (589).

Joseph Dixon Crucible Company, (16); The G. Drouve Company, (607); The Duff Manufacturing Company, (637); DuPont Fabrikoid Company, Inc., (307); The Dayton Fare Recorder Company, (386 and 387); Drew Electric & Manufacturing Company, (315).

Elastic Car Waste Company, (576); The Electro-Mechanical Brake Company, Ltd., (610); *Electric Traction*, (10); The Esterline Company, (318); The Ellcon Company, (534 and 536); The Eclipse Railway Supply Company, (571 and 573); The O. M. Edwards Company, Inc., (519 and 521); The Electric Railway Improvement Company, (570 and 572); Electric Service Supplies Company, (414); ELECTRIC RAILWAY JOURNAL, (7).

Flood & Conklin Company, (18); Fonger Fender Company, (330); Federal Signal Company, (131).

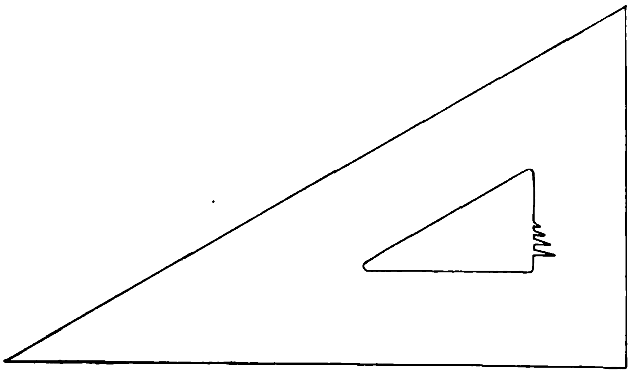
Notched Triangle to Aid Good Lettering

BY G. H. MC KELWAY, ENGINEER OF DISTRIBUTION BROOKLYN RAPID TRANSIT SYSTEM



NOTCHED TRIANGLE FOR EVEN LETTERING

The appearance of a drawing is always greatly improved if the lettering has been done in a neat manner, but many draftsmen object to taking the time required to make the letters carefully and therefore turn out much poorer looking work than they should. A few days ago the writer noticed a draftsman using a triangle with a number of notches of different depths cut into it, as shown in the drawing, and inquiry revealed the fact that they were used to aid in the drawing of lines to insure that all letters of the words on the drawings were of the proper height.

When ruling such lines the average draftsman must first mark off with a rule a number of points the required distance apart and then draw the lines through those points with his T-square to get them parallel to each other, shifting the T-square down to the next point each time after drawing a line through the one above. All of this takes time, whereas the plan observed was so much simpler and quicker that it may be of value to others.

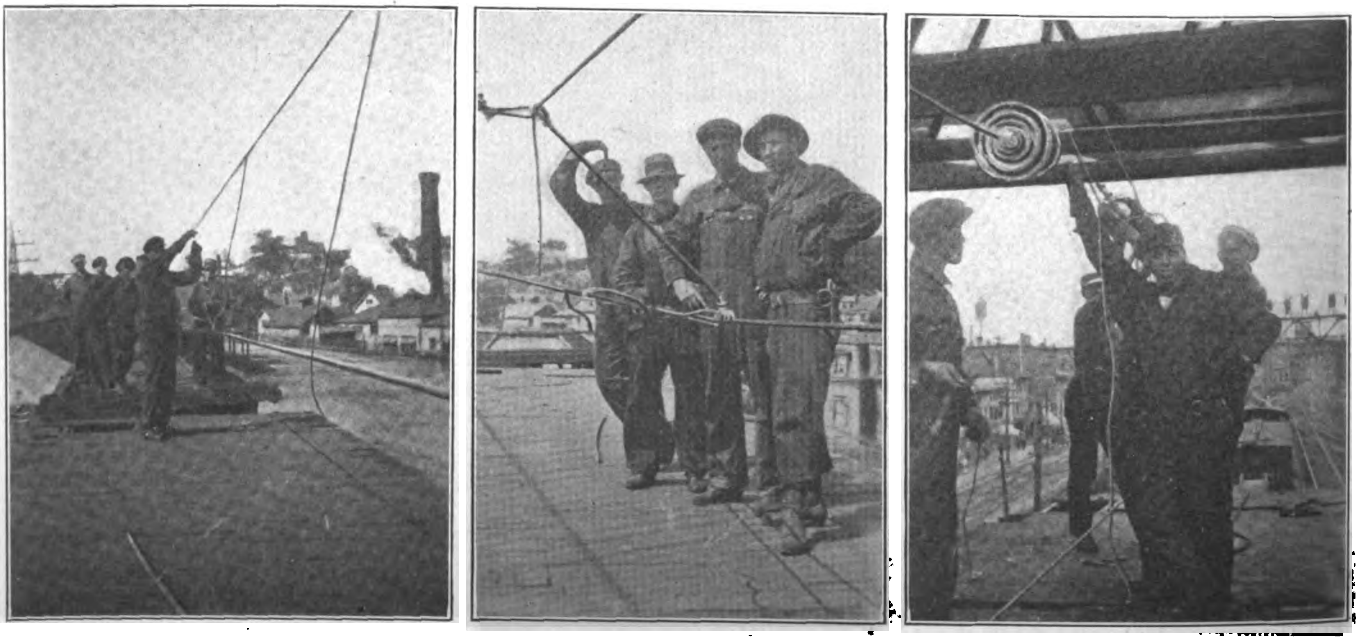
With the triangle notched as illustrated there is no marking of the distance apart that the lines are to come, or of shifting the T-square from one point to another. The bottoms of the notches are each a certain distance below the one next to it, so that all that the draftsman has to do is to set his T-square once, put the pencil point in one of the notches, move pencil and triangle across the paper, making one line, then shift the pencil to another notch, depending upon the size of the letter to be made, and draw another line, always without moving the T-square. This can be repeated again if a third line is desired to make the letters, the pencil being moved to still another notch. The result is a number of parallel lines made so quickly and easily that the draftsman has no excuse for not using them and thus securing a great improvement in the appearance of his drawings.

New Haven Construction Notes—Yards and Sidings

BY A FORMER INSPECTOR

In electrifying the yards and sidings of the New York, New Haven & Hartford Railroad most of the wire was pulled by hand. A few of the sidings were equipped by means of work trains, while in other cases we used small tower cars. The accompanying illustrations will show the variety of conditions and methods which were applied better than any extensive descriptions.

Fig. 1 shows the messenger and trolley wires being lined up before measurements were taken for the



NEW HAVEN CONSTRUCTION NOTES—FIG. 1—LINING UP MESSENGER AND TROLLEY WIRE: FIG. 2—PULL-OFF HANGER TIED TEMPORARILY IN PLACE ON A CURVE; FIG. 3—INSULATOR FOR STEEL MESSENGER WIRE AT BRIDGES

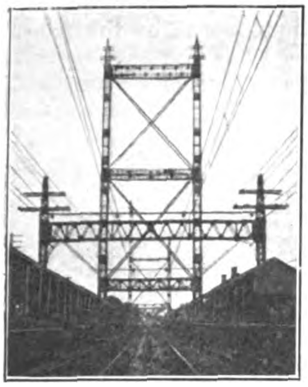


FIG. 6—STEEL TOWER AT NAVIGABLE WATER

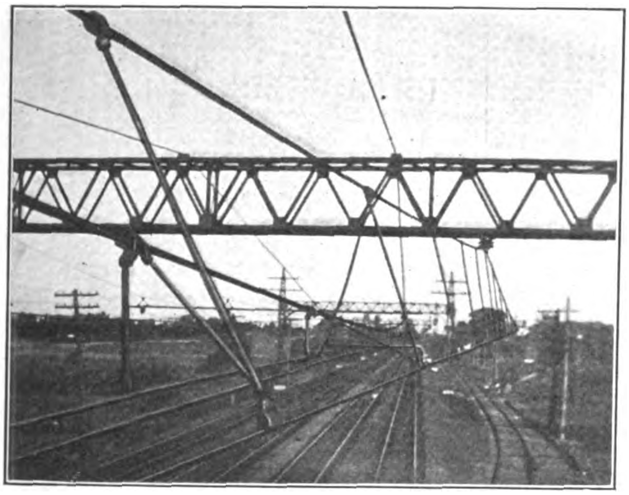
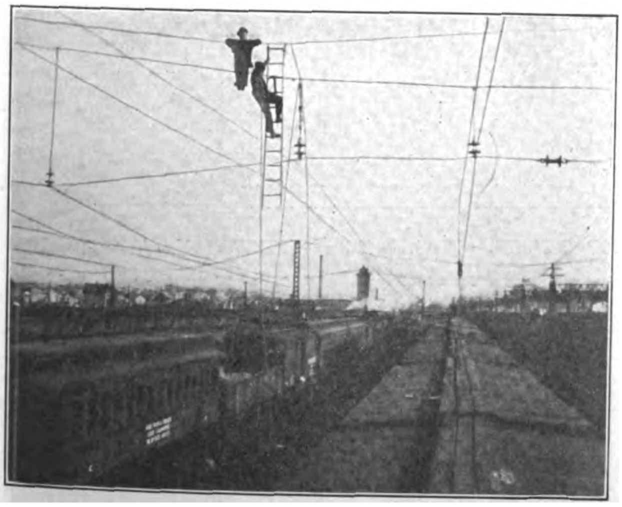
hanger rods. A tie wire was used wherever a hanger was to go. The measurement for the hanger spacing was 10 ft., plus or minus. The hanger rods were measured with a scale which showed the correct length of rod required, with due allowance, of course, for the trolley clip and the hook over the messenger.

In a number of places we found it possible to use standard hangers. Thus Fig. 2 shows a pull-off hanger temporarily tied in place on a curve. Fig. 3 illustrates the form of insulator used with the 3/8-in. steel messenger at catenary bridges. Fig. 4 shows a typical passage at a switch point from the bridge type construction of the main line to the pole type construction at sidings.



NEW HAVEN CONSTRUCTION NOTES—FIG. 4—PASSAGE FROM MAIN LINE TO A SIDING

Cross-span work under way in a large yard is shown in Fig. 5. The ladder was hung on what we termed a riding wire. This wire was put up between the poles or span supports so that the men could go up the poles and ride out on a ladder or safety belt to any wire on which they had to work. Those who saw the linemen on wires commonly remarked that they were human spiders.



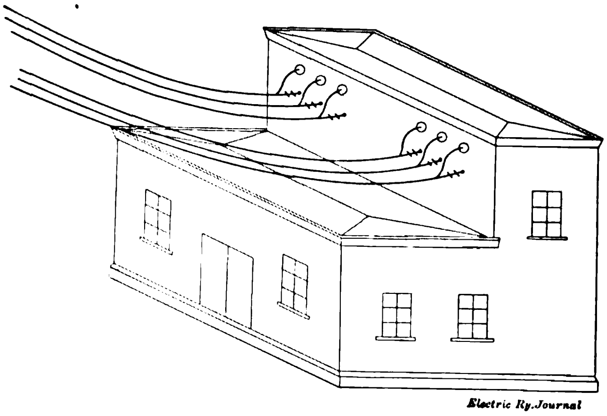
NEW HAVEN CONSTRUCTION NOTES—FIG. 5—CROSS-SPAN WORK IN A LARGE YARD

The final view, Fig. 6, is an interesting variation from the general construction inasmuch as it shows the steel towers which were erected on the shores of navigable waters in accordance with the clearance provisions of the United States War Department.

Safe Substation Design for Incoming Wires

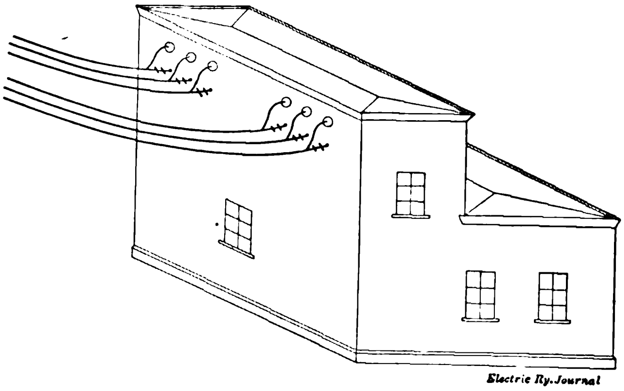
BY J. G. KOPPEL, ELECTRICAL SUPERINTENDENT OF BRIDGES, SAULT STE. MARIE, ONT.

Much has been done to raise the standard of substation equipment, but very little is heard about the design of the substation building. Sometimes the station is designed by a man who knows so little about the conditions that work in or around it is positively dangerous. Thus Fig. 1 shows a substation for stepping down the incoming voltage from 24,000 volts alternating to 600 volts direct current, as actually designed by a well-known engineering company. At first sight nothing may seem wrong with the design, but this is not the case, as will soon appear.



Electric Ry. Journal

FIG. 1—UNSAFE SUBSTATION BECAUSE THE INCOMING HIGH-TENSION WIRES PASS OVER THE LOWER ROOF



Electric Ry. Journal

FIG. 2—SAFE SUBSTATION BECAUSE THE INCOMING HIGH-TENSION WIRES GO DIRECTLY INTO THE MAIN BUILDING.

In my seven years' experience as a construction man in various parts of the United States and Canada I have known three cases where fellow-workmen were electrocuted because the incoming high-tension wires were carried across an adjacent structure or lean-to where the clearance between the roof of the lean-to and the wires was as low as 10 ft. and even less. In the first case the roof was leaking and a man was sent up to correct the trouble. When he had climbed to the roof he asked for a short ladder to enable him to go from the lean-to roof to the tower roof. A 15-ft. ladder was handed to him. He was warned to be careful, that the wires were alive and that the clearance between the wires and the roof was only 11 ft. But through failure to realize the danger from highly-charged wires he struck one of them with the ladder and was killed. The second case occurred at a substation of like design where the wires were only 6 ft. above the roof of the lean-to. A man who was painting the windows above the roof struck a wire accidentally and was killed. The third case was similar to the second.

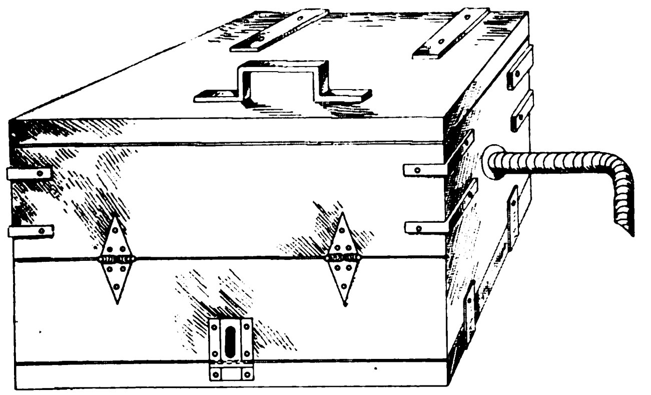
These experiences indicate that to avoid clearance accidents the design of Fig. 1 should be turned around, as shown in Fig. 2. Furthermore, the code issued by the American Institute of Electrical Engineers, which prohibits the running of incoming wires over the roofs of adjoining buildings or lean-tos, should be strictly enforced. In this way "safety first" for the substation worker will become a reality in this respect at least.

Heater for Melting Paraffine, Etc.

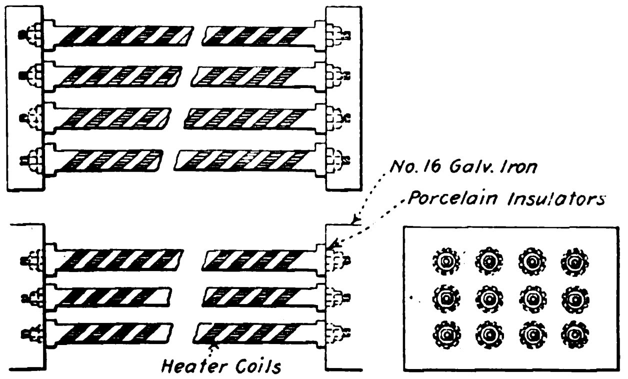
BY R. H. PARSONS, ELECTRICAL FOREMAN

The accompanying six sketches illustrate a heater which is used for melting paraffine, for heating oil and for baking small coils. It is not only efficient in operation, but it is approved by the fire underwriters as well.

This heater consists of a box constructed of 1½-in. soapstone, with cover, divided into an upper compartment for the material to be heated and a lower compartment for the oven. Dimensions are given on the sketches, but the heater can be constructed, of course, to any desired size according to shop conditions. The sides are made with squared ends which after being placed flush together are held in position by angle corner brackets bolted to each section. The joints or seams of the box illustrated are sealed with plaster of paris, but cement would also serve.



SHOP HEATER—FIG. 1—HEATER COMPLETE



SHOP HEATER—FIG. 2—HEATER COILS ON PORCELAIN SPINDLES

Fig. 1 is a general view of the box as it stands, while Figs. 3 and 4 are sectional views of the front and ends. These sketches also show the shelf which separates the heater from the oven proper. This shelf is supported on angle irons. Below the shelf is a heater and above it is a galvanized iron pan, fitted to the compartment, into which the paraffine is placed for melting. Like the other parts of the box the shelf is made of soapstone so that it will retain heat. The value of soapstone is proved by the fact that the heated paraffine will remain fluid for five hours after the heat has been turned off. Figs. 5 and 6 give details of the construction of the box.

The heater itself, as shown in Fig. 2, consists of twelve former car heater coils wound on porcelain spindles. The coils are bolted into two galvanized iron frames which are constructed to fit into the lower compartment of the box but they can be drawn in and out when it is necessary to make any repairs to the heater coils. Each heating unit has a resistance of 2 ohms, making a total of 24 ohms or the approximate equivalent of 23 amp at 550 volts. This amount of current gives a good margin of heat for the purposes mentioned.

SHOP HEATER—FIGS. 3 TO 6—ELEVATIONS AND SECTIONS

In connection with the outfit there is used a tray constructed of mesh on which the material to be treated is placed, the whole then being immersed in the hot paraffine. When the treatment has been continued long enough the tray is picked up, the hot paraffine draining through the mesh while the treated material is left to cool and dry.

Calculating Machines and Dictaphones at Portland, Ore.

BY C. N. HUGGINS, TREASURER PORTLAND RAILWAY, LIGHT & POWER COMPANY

The Portland Railway, Light & Power Company, Portland, Ore., makes such extensive use of calculating machines and similar devices in its accounting and receiving departments, that the following data may be of interest to others who are concerned with efficiency and economy in the offices of electric railways.

The "Marchant" calculating machine, manufactured by Marchant Bros., Oakland, Cal., is used in the statistical department. It is particularly desirable for the figuring of car mileage, percentages and other statistical data. In the hands of a competent operator this machine will easily save one-half the time required for mental calculation. The "Millionaire" calculating machine, manufactured by W. A. Marschauser, agent, New York, is intended for the same work as the "Marchant," but is of an earlier type, and it is not considered particularly desirable for the work described.

At the carhouses the local cashiers use a special cash register manufactured by the National Cash Register Company, Dayton, Ohio. These machines are arranged for operation by three different teller clerks, and serve to make record of all turn-ins by conductors and to give a printed receipt to the conductors for the amount of same. The records as made by each teller are locked in the machine and are totaled by the general office clerk when the record tape is removed at the end of the day. There is no special saving of time in the use of these registers, but the check against the conductors' reports is invaluable, as is also the positive feature of the receipt and turn-in.

In the accounting room the company uses several coin-counting machines manufactured by the Johnson Coin Counting Machine Company, New York and Chicago. These machines count all of the coins of the various denominations, which are put up in sacks ready for delivery to the banks. The company also uses four "Comptometers," manufactured by Felt & Tarrant, and two Burroughs machines of similar type, all of which are used in multiplying and division work where no listing is required. In addition to these adding machines, the company has the usual complement of motor-operated listing adding machines of the Burroughs type and a few of the Daltons.

In the light and power department, two "National" cash registers are used. These registers clip the office coupon from the light and power bills, receipt the original invoice and the coupon, and at the same time record the amount of collection. These machines are also motor-operated.

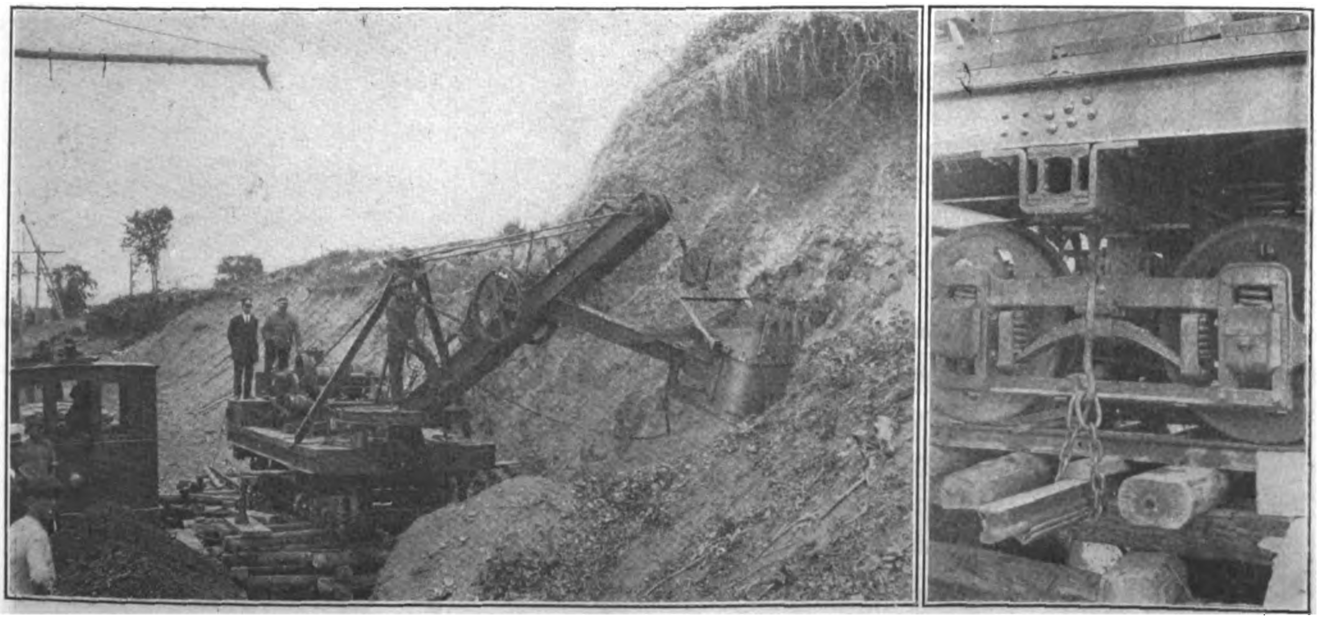
The company also uses with very beneficial results a Hollerith sorting and tabulating outfit made by the Tabulating Machine Company, Washington, D. C.

The Portland Company also uses about three dozen dictating machines of Edison manufacture. It finds a material saving from their use in connection with the central stenographic and transcribing service which is maintained for all departments.

Electric Shovel Made at Bangor, Maine

The Bangor (Maine) Railway & Electric Company recently built an electric shovel for service at gravel pits on its lines, the equipment being designed by M. E. McCormick, assistant general manager. With the exception of a Lidgerwood electric hoist which was purchased for the outfit, practically the entire apparatus was built from material of second-hand or scrap value already in the hands of the company. Fig. 1 is a general view of the shovel at work in a gravel pit on the banks of the Kenduskeag River. It is mounted on a flat car 22 ft. long x 9 ft. wide, the car being mounted on a pair of formerly discarded trucks fitted with 33-in. wheels. When in service the flat car is anchored to cribwork upon which the track is laid, as illustrated in Fig. 2.

The boom, which is 18 ft. long, is built of two 12-in., 25-lb. channel irons, these being tied to a tripod by 1¼-in. steel rods equipped with turn-buckles. The boom is stiffened by plates made from an old spring frog, these being 16½ in. wide, 4 ft. long and ⅝ in. thick. The dipper handle, composed of 8-in. 13-lb. channels, is 9 ft. long, and is mounted on a shaft, at the ends of which are wheels fitted with band brakes, the shaft being made from a discarded car axle. The boom is fastened to the bull wheel by a 3-in. pin turned from a 3¾-in. car axle and the main pin of the bull wheel was also made from an old axle. The bull wheel rests on a casting 12 in. high x 30 in. in diameter, which



ELECTRIC SHOVEL, BANGOR—FIG. 1—GENERAL VIEW OF SHOVEL; FIG. 2—METHOD OF ANCHORING ELECTRIC SHOVEL CAR, REAR TRUCK, SHOWING ALSO THE REINFORCEMENT OF THE CAR UNDERFRAME is bolted to the framing of the car. The bull wheel is 6 ft. in diameter and the capacity of the bucket is ¾ cu. yd. The hoist is operated by a GE-800 motor and the rear truck is equipped with two similar motors to move the entire car back and forth as required, contact being made with the trolley wire by a flexible cable run from a circuit breaker on the side of the operating platform to a pole or "bug" shown in Fig. 4. Two controllers are mounted on the platform, one for the hoist and the other for the car motors.

The underfranming includes two central longitudinal 9-in. I-beam and two 9-in. girder rails run from end to end, with 9-in. I-beam side sills. The cross members are built up from discarded 4-in. T-rails, angle-irons and plates, forming U-shaped channels 6 in. high reinforced by the rails. A 6-in. channel iron connects the side and central members at the middle of the car and above this, as well as above the lateral members above mentioned, T-rails are riveted to the side sills, as shown in Fig. 2. The end sills are 9-in. channels and the central I-beams are spaced 9½ in. and 12 in. on centers. Diagonal channels 6 in. high are run at four points in the side sills to the cross bracing. Extra reinforcement under the platform below the bull wheel location is provided in the shape of rail, channels, and a plate, as indicated in the accompanying sketch of the underframing, Fig. 5. Two 4-in. T-rails are also provided for longitudinal reinforcement. The forward and rear ends of the car can be jacked up as required, as shown in Fig. 6, a 4-in. axle shaft being seated on wooden blocks carried by 2½-in. jacks, the shaft being run through the built-up channel crossing

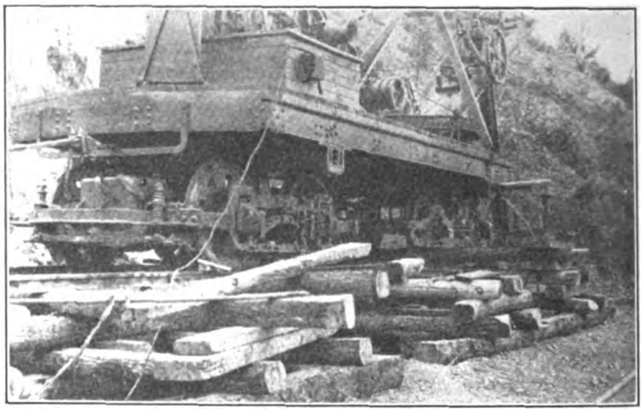
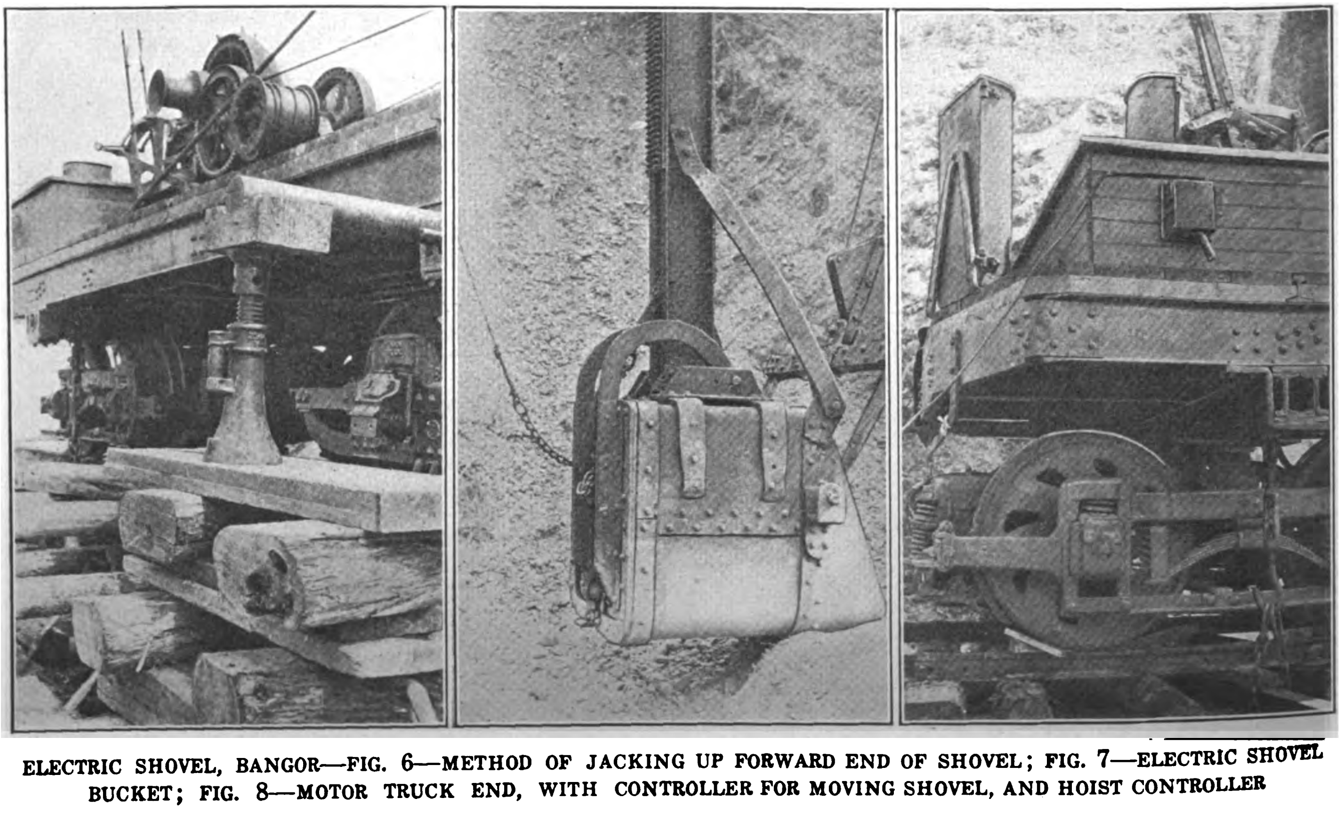
ELECTRIC SHOVEL, BANGOR—FIG. 5—UNDERFRAMING



ELECTRIC SHOVEL, BANGOR—FIG. 4—CAR FLOORING, TRUCKS AND "BUG" CONTACT POLE



ELECTRIC SHOVEL, BANGOR—FIG. 6—METHOD OF JACKING UP FORWARD END OF SHOVEL; FIG. 7—ELECTRIC SHOVEL BUCKET; FIG. 8—MOTOR TRUCK END, WITH CONTROLLER FOR MOVING SHOVEL, AND HOIST CONTROLLER the underside of the car at right angles to the sides. The body bolster shown in Fig. 2 is fastened to the rail and plates in the cribwork by a 1¼-in. hook bolt, with chain as illustrated. The tripod above the bull wheel is built of T-rails and is braced by two 1¼-in. tie rods, the outer rails being clamped and riveted to the side sills. The cost of the shovel complete was about $2,000, compared with bids of about $6,000 for an outfit on the open market. In service it is operated by three men, two of whom are required to handle the shovel while the third trims the load. These men also operate gravel trains as required, and recently the company loaded and hauled 1500 cu. yd. of gravel 13 miles, making the round trip of 26 miles with the gravel train at a labor cost of only 16 cents per cubic yard.

Typical Fireproof Bus and Switch Compartments

BY EMIL G. BERN, ENGINEER IN SWITCHBOARD DEPARTMENT GENERAL ELECTRIC COMPANY

In power stations employing electrically operated switches for medium high voltages and heavy currents, the buses, connections and switches are usually installed in concrete or brick compartments. Concrete is used in most cases. Sometimes complete forms are made, usually of wood, and the whole compartment poured.

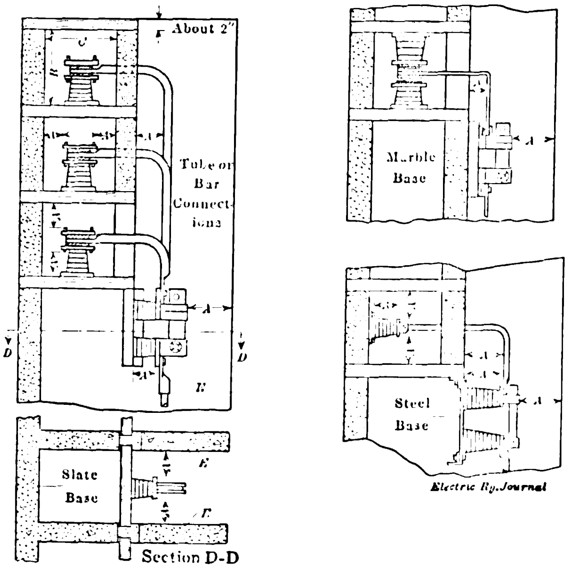


FIG. 1—SECTIONS OF TYPICAL BUS COMPARTMENTS

Although this gives the best construction, it is comparatively expensive. More often the compartment is built of various sizes of concrete slabs set in cement, in which case construction is cheaper, though fairly accurate results can be obtained.

Fireproof bus compartments usually inclose or separate the different phases of the buses and connections by masonry. As this masonry must be considered at ground potential, the general dimensions of the compartments are determined primarily by the allowable distance between live parts and ground for different voltages.

Fig. 1 shows sections of typical bus compartments, with fundamental dimensions for different voltages based on average capacities and conditions. With the help of the table, the bus compartment can easily be designed. It is, of course, necessary to determine, first, the dimensions of the switches, busbar supports, buses, connections and the clamps for attaching the connections to the buses, and also to take into account mechanical clearance and convenience in installing the material.

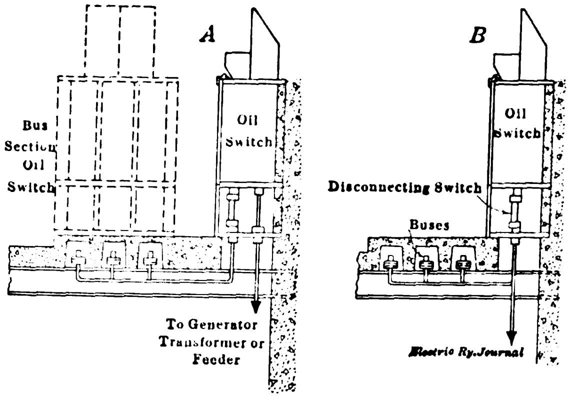

FIG. 2—FIREPROOF BUS AND SWITCH COMPARTMENTS—BUSES IN FLOOR

The compartment shelves are usually about 2 in. thick, but are sometimes thicker when of concrete for large compartments. The thickness of the barriers between phases is determined by the mechanical strength of the structure. This also applies to the thickness of the compartment walls. In brick compartments the dimensions of the brick usually predetermine the thickness of the walls; in concrete structures the thickness of the walls and barriers is generally from 3 in. to 4 in.

For voltages up to 3300 disconnecting switches are mounted on marble bases without insulators. When provided with insulators, they are usually mounted on steel bases, which have the advantage of occupying small space. The latter method also preserves the adjustment of the switch, and it is less liable to injury during shipment and construction work. Fig. 1 shows several methods of mounting disconnecting switches in compartments.

Disconnecting switches are occasionally used for isolating horizontal sections of the bus and are then located in the compartments in a straight line with the bus, the insulators being secured either to the shelf or the back wall of the compartment. If the bus is heavy enough and securely anchored it can serve as hinges and

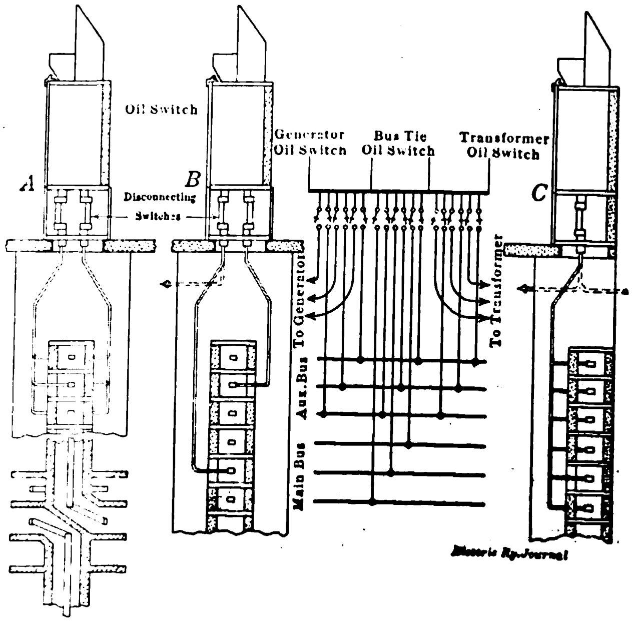

FIG. 3—FIREPROOF BUS AND SWITCH COMPARTMENTS—DISCONNECTING SWITCHES MOUNTED IN SUB-COMPARTMENTS OF OIL SWITCH

clips for the switch, thus somewhat simplifying the construction. Whatever type of switch is used, care must be taken to see that proper ground clearance is obtained from the blade in any position.

FIG. 5—FIREPROOF BUS AND SWITCH COMPARTMENTS—ALL SWITCHES ON ONE FLOOR

To withstand mechanical stresses incidental to momentary short-circuits and heavy overloads, it is necessary that the buses and connections should be securely anchored, while at the same time provision must be made for expansion and contraction of long buses due to temperature changes. The bus supports may be secured either to the shelves or the back wall of the compartment, but must be located near openings so as to be accessible for cleaning and inspection. For convenience in joining connections to the bus the busbars are usually laid on side. The space available for the switching equipment largely determines the design of the compartments.

Sometimes the buses are located on the floor below the oil switches, which construction is very desirable when using bottom connected switches, provided the disconnecting switches between the oil switches and the bus are located so that a person operating them can see whether the oil switch is open or closed. To meet this condition and thus eliminate the danger of operating the wrong disconnecting switch, they may be installed in a sub-compartment in the oil-switch cell just above the floor. A door for this sub-compartment, of the same width as the oil switch, helps to determine without question which disconnecting switches belong to a certain oil switch.

The remainder of the information will refer only to bottom connected electrically operated switches, either with the oil vessels in one or two rows, tandem or parallel, as indicated by *B* and *A*, respectively, of Fig. 2. Fig. 2 shows an arrangement of oil switches with the sub-compartments, disconnecting switches and buses installed in the floor. The buses are supported and accessible from below. Barriers of asbestos lumber or similar material may be provided between connections of different phases, if considered necessary.

If disconnecting switches are required on one side of the oil switch only, the parallel-arranged oil switch may be used and installed against the wall, as shown in *A*. With disconnecting switches on both sides of the oil switch it is possible to arrange all of them in the sub-compartments by providing space back of the oil switch for operating them, or by using the tandem-arranged switch as shown at *B*. With the first arrangement a bus-section oil switch may be installed directly over the buses; while with tandem-arranged switches the construction can be materially improved and made more compact by locating the bus-section oil switch in line with the other switches.

Fig. 3 shows bus compartments on the floor below the oil switches, the disconnecting switches being arranged in sub-compartments. *A* represents a bus-section switch; *B* a bus tie, generator or transformer switch connected according to the diagram. *C* shows the application of the tandem-arranged oil switch to the same conditions as *A* and *B*. If the room containing the bus compartments is also used for other purposes, it is advisable to provide doors between the barriers to guard against accidental contact with the connections.

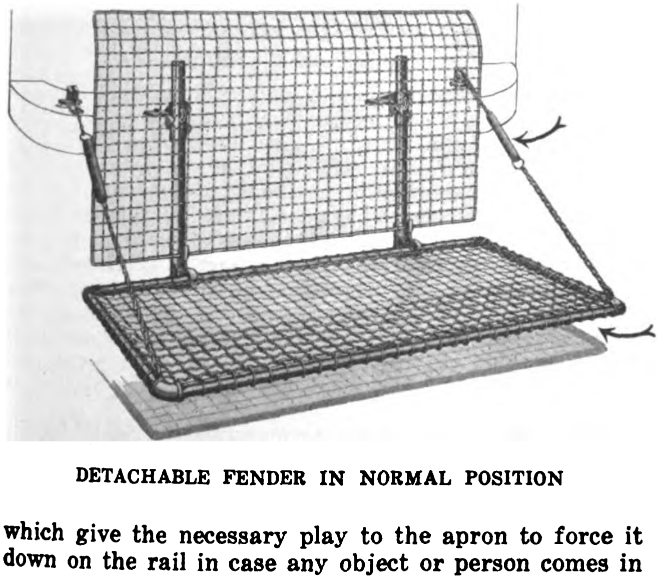
It is often necessary to install the bus and switch compartments on the same floor; and in some cases this floor is immediately above the transformer compartments, so that the connections between the different elements cannot be made under the floor. A compact construction of this kind is shown in Fig. 4, which provides for bus tie, transformer and generator switches connected in the same manner as in Fig. 3. This construction requires, however, a set of disconnecting switches, arranged horizontally in the buses. Passages through the compartments can easily be provided under the main bus, as indicated in the figure.

Another construction furnishing the same electrical connections is shown in Fig. 5. Here false floors must be provided over the connections, unless these can be carried through and under the floor. This false floor over the connections between the oil switches and the compartments consists of removable slate slabs resting on vertical brick or concrete barriers between the connections. With this construction it is necessary to provide doors for the compartments as well as for the oil switches.

Section *A* shows the construction of a bus tie connection; section *B*, a generator or transformer connection; and the plan view *C*, a combination of the above for connecting a generator to its transformer or to the main bus in the same manner as indicated in the diagram of Fig. 4. Section *D* shows how a feeder circuit may be connected to the main bus and how the instrument transformers may be installed in line with the auxiliary bus compartment if desired. Disconnecting switches may also be accommodated in this compartment for isolating the instrument transformers from the line when energized from the other end. The bus section oil switch with disconnecting switches may be installed as illustrated at *E*. The oil switch must, however, be placed at right angles to the main compartment.

A Simple Detachable and Folding Fender

For conditions that demand an extremely simple yet effective fender, the Trolley Supply Company, Canton, Ohio, has devised the No. 3 detachable type which is here illustrated in its normal position. The construction of this fender permits the apron or cushion to be instantly removed in case either becomes damaged or in case of the coupling of cars for train service. The fender is connected to the car by means of two heavy pieces of wrought-iron pipe fastened to the bumper, and the apron is supported by two chains in the middle of which are suspended strong crucible steel springs, which give the necessary play to the apron to force it down on the rail in case any object or person comes in contact with the fender.

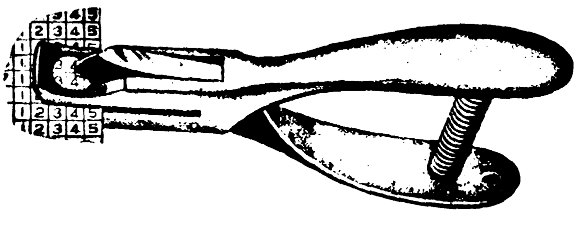


DETACHABLE FENDER IN NORMAL POSITION

The apron is made with a frame of wrought-iron pipe, and the apron proper as well as the cushion consists of woven wire with 1-in. diamond mesh. The frame of the cushion consists of 1-in. iron rod. To remove the apron a cotter pin is withdrawn from the fixture at the bottom of the supporting pipes. This fixture opens up and the apron is lifted out. The cushion is supported by a metal lug in the fixture at the bottom of the supporting pipes and by a metal lug in a second fixture placed at about the same height as the bumper; hence it may be lifted out at any time desired.

Non-Clogging Open Sight Punch

The conductor's ticket punch may not bulk as large in the eyes of the electric railway operator as other items of equipment, but the conductor himself knows how helpful a well-made punch can be when transfers must be perforated in large quantities. Again, a clear-cut time perforation is a good aid against the misuse of transfers by the public. The standard electric railway punch of the Busby Manufacturing Company, Boston, Mass., illustrated herewith, is an example of specialization in this class of tools. One of its principal merits is the reinforced cutting edge, which greatly increases the life of the punch. Both the upper and lower dies are of exceptionally hard steel instead of being merely case-hardened. Furthermore, all pins are of steel. All spots to be perforated are visible from both sides of the punch, thus insuring accurate work in addition to clear cutting, while it is practically impossible to clog the mechanism.



AN OPEN-SIGHT PUNCH

Panels for Headlining in Cars

"Nevasplit" is the name of a well-known panel material which has been prepared by the Keyes Products Company, New York, for headlinings, roofs, insulation, interlining and wainscoting under windows of electric railway cars. It is composed of a wood fiber base but is free from knots, sap and all resinous matter, so that it presents an entirely uniform surface. This material is said to have practically no shrinkage or expansion, and as it is grainless, splitting or cracking is impossible. The liability of air leakage is thus eliminated. No dependence whatever is placed upon glues or excessive pressure as a means of solidifying, stiffening or strengthening the panels, but the fibers of thousands of tissue-like layers are mechanically felted together to produce a board of absolute uniformity, great strength and lightness and of better insulating qualities against heat or cold than a mere dense sheet could possibly be.

This material may be formed either in curved shapes or practically straight ceilings without fear of laminating or blistering even after long exposure to moisture. The weight of 3/16-in. thickness of this material is 75 lb. per 100 sq. ft.; ¼ in., 90 lb.; ⅜ in., 130 lb. In other words, 300 ft. of 3/16-in. headlining, as used in the average car, would weigh only about 225 lb.

The Chilean commission which was appointed to report on the proposed railway from Santiago to Valparaiso via Casa Blanca has advised the construction of an electric railway of the same gage as the State line now connecting the capital with Valparaiso, and also suggests that several branch lines be constructed to link the existing systems.

News of Electric Railways

THE TOLEDO INJUNCTION

Former City Solicitor Replies to Court—Detroit Decision Quoted—Contempt Cases

Following a statement made by Cornell Schreiber, former city solicitor of Toledo, Ohio, relative to the injunction granted against the 3-cent fare ordinance by the United States District Court, Judge John M. Killits sent him a communication suggesting that he present law and facts sufficient to sustain the ordinance, of which he is the author, or prove bad faith on the part of City Solicitor Thurstin. In his reply to the court Mr. Schreiber explained that the theory upon which he based his opinion was that all rights of the company ceased when its franchises expired, that the ordinance could not be confiscatory unless there was something to confiscate and that the city was the sole judge of the terms upon which the company could continue to operate. Judge Killits said that this theory had been presented to the court by both Solicitor Thurstin and the attorneys for the Toledo Railways & Light Company. Mr. Schreiber asserted he did not intend to insinuate bad faith on the part of the legal department, but believed the case was not properly presented.

In his letter to Judge Killits Mr. Schreiber mentioned the case of the city of Detroit against the Detroit United Railway and cited those clauses from the decision of the Supreme Court of Michigan which seemingly support the contention that he makes in favor of his ordinance. The court in this case said that the operation of a street railway after its franchises had expired was a continuing trespass for the restraint of which the municipality is entitled to a writ of injunction, as well as for its removal. Again, a franchise granted to a street railroad and accepted by it constituted a contract mutually binding on both parties and terminated by the limitation expressed therein. The decision quoted also stated that a street railroad was not bound to continue operation after its franchise had expired, on the theory that there is no implied obligation on the part of both the company and the municipality to keep the road in operation for the benefit of the public.

Judge Killits made a statement on Sept. 19. He agreed with practically all that Mr. Schreiber had said, but said that his decision was based not upon the portions of the Detroit case quoted, but upon the entire syllabus as well as on other cases. Briefly stated these decisions provided also that a company may operate its cars from day to day, after its franchise had expired, without the city's consent and charge fare, because its service is a public necessity. It may charge a rate that will pay expenses of operation, including a return on the investment for the time it is so operated. Out of any revenues that remain it must compensate the city, if the city so desires. The city through the Council may fix terms for the operation of the road which will become binding on the company only if they are reasonable, having regard to the circumstances which are peculiar to the local situation. However, the city may summarily deprive the company of the use of the streets except to salvage its property, and the company may stop its cars at any time it may be deemed profitable for it to do so.

Motions were filed in the Federal Court on Sept. 19 asking for the vacation of the order citing the editors of the Toledo *News-Bee* and the Toledo Newspaper Company for contempt in connection with articles that appeared in the paper relative to the railway injunction suit. Judge Killits notified the respondents that he would file a supplemental order on that day, elaborating the original order. The motions allege that the acts of the respondents do not constitute contempt; that the court does not have jurisdiction in the matter; that the charges are not based upon affidavits or other competent proof; that no affidavit or other affirmation in writing has been filed in court or presented to the judge and that the order is uncertain and indefinite. At a hearing in the afternoon of the same day Harry J. Howard, managing editor, was released, while Negley D. Cochran, editor, and E. B. Conliss, business manager, were held.

NEW ORGANIZATION OF EMPIRE UNITED

The Beebe Lines Adopt a Divisional Organization with "General Staff" at Syracuse

A change in the operating organization of the Empire United Railways, known popularly as the Beebe lines, of Syracuse, N. Y., has recently been put in force by Ernest Gonzenbach, general manager. Briefly, the plan is similar to that followed on the Pennsylvania Railroad and other steam roads which have a divisional organization as distinguished from the plan of departmental organization followed on other railways. In practice each operating division of the company will be in charge of a local manager who will have complete charge of that division, including operation, mechanical and electrical departments and public relations. In addition, there will be a central organization at Syracuse. This central organization will consist of an engineering department, having consulting relations only with the various divisions; a claims and legal department, which will co-operate with the local managers in the settling of claims and all legal matters; a business getting department, which will make rates and co-operate with the managers in developing new business, and, of course, a central auditing department. To use a military expression, the various divisional officers are the "line," and the central organization will be the "general staff."

Altogether the property will be divided into four operating divisions as follows:

Auburn & Syracuse division, George A. Lewis, manager, including city lines in Auburn. The total trackage operated of this division is 67 miles. This division also includes a steamboat line on Skaneateles Lake.

Rochester-Syracuse division, H. C. Prather, manager. This division includes the interurban line between Rochester and Syracuse and that between Port Byron and Auburn. The total trackage operated on this division is 186 miles.

Syracuse-Oswego division, P. E. Emerson, manager. This division includes the Oswego City lines. Its total trackage is 75 miles.

Syracuse and South Bay division, Charles Craigmile, manager. The total trackage operated by this division is 33 miles, and it includes a steamboat line on Oneida Lake.

TRANSIT PROGRESS IN BROOKLYN

A Summary is Presented of Progress in Brooklyn Under the Dual Rapid Transit Contracts

The progress report of the New York Municipal Railway on construction work under the dual rapid transit contracts to Sept. 1 shows very rapid progress on the Sea Beach line. On this line a total of 750,000 cu. yd. of excavated material have been removed since the beginning of this work. About 62,000 cu. yd. of concrete have been placed on the Sea Beach line; 45 per cent of the steel has been fabricated and delivered and 30 per cent erected. Sections of reinforced concrete bridges have been constructed at different street crossings. The installation of track and line equipment on the Sea Beach route is under way. Contracts have been awarded for the erection of a substation at Sixty-fourth Street and Fourth Avenue and for the enlargement of the station at New Utrecht Avenue.

Important work required in connecting the South Brooklyn line with the Fourth Avenue subway, so as to enable operation at the earliest possible time, has been progressing rapidly. Plans and specifications have been prepared and bids have been received covering the installation of lighting, track and line equipment in the Fourth Avenue subway between the Manhattan Bridge and Fortieth Street. Work on the installation of line equipment has begun and the installation of lighting and track equipment will be started at an early date.

Plans and specifications have been prepared covering the installation of the latest and most approved type of block signaling and interlocking devices on several sections of the Broadway-Fourth Avenue line, Sea Beach line and the Broadway and Fulton Street additional tracks.

In the Centre Street loop the work of completing the two remaining tracks is progressing satisfactorily. The contract has been awarded for the installation of station and tunnel lighting and ventilation and work in connection with this installation has begun. The contract has been awarded for the installation of safety interlocking and block signaling plants for the Centre Street loop.

With respect to the third tracking of the Broadway Elevated line, the contract for the fabrication of the steel required in connection with the strengthening of the structure so as to permit the additional tracks between Havemeyer Street and Myrtle Avenue has been let and work on this third tracking will be under way in the near future.

On the reconstruction of the Lutheran line, the steel work of the first section as far as Fresh Pond Road has been completed and on the second section between Fresh Pond Road and Metropolitan Avenue 94 per cent of the steel required has been delivered and 63 per cent erected. The column foundations have all been completed on the second section, as well as the retaining wall and the abutment at the end of the section.. The installation of interlocking plants and erection of terminal buildings is under way and bids have been opened for the installation of track and line equipment and a recommendation has been made as to the award covering that work.

The third tracking of the Fulton Street line between Nostrand Avenue and Sackman Street has been progressing satisfactorily, 67 per cent of the total number of foundations to be reinforced has been completed.

On the Liberty Avenue line, which carries the Fulton Street elevated from the city line as far as Lefferts Avenue in Queens Borough, the column foundations are practically completed; 36 per cent of the steel has been fabricated and delivered and 32 per cent of it is erected. From the city line to Amber Street 65 per cent of the structure has been completed.

SUBWAY CONSTRUCTION CONTRACTS IN NEW YORK

The last section of the Harlem River tunnel on the new Lexington Avenue subway has been sunk. This tunnel connects the tracks in Lexington Avenue, Manhattan, with those on the Bronx side of the river. It consists of four steel tubes laid in concrete. The tubes were built by the Arthur McMullen & Hoff Company, the contractor for this work, in five separate sections, each section being sunk to its proper place in the river at a different time. The five sections have now been placed under water without serious accident. The four sections previously placed have been encased in concrete, the water withdrawn, and the work of lining the interior with concrete is under way. The contract for this part of the subway was delivered on July 23, 1912, the time limit for its completion expires early in 1916. It is now about 67 per cent completed.

The Public Service Commission for the First District has advertised for bids, to be opened on Oct. 9, for the construction of Section No. 1 of Route No. 48, the Park Place, William and Clark Street subway, to be operated by the Interborough Rapid Transit Company. This line diverges from the Seventh Avenue subway in West Broadway between Park Place and Murray Street, curves southeasterly under the corner of Park Place and West Broadway and runs easterly under Park Place, the United States Post-office Building and Beekman Street to William Street and southerly under William Street to the tunnel to Brooklyn at Old Slip.

Bids were opened on Sept. 15 by the commission for the construction of Section No. 2 of Route No. 48, the William Street part of the Park Place, William and Clark Street subway, to be operated by the Interborough Rapid Transit Company. The following are the official totals of the bids: Smith, Hauser & McIsaac, Inc., $2,254,670; Rapid Transit Subway Construction Company, $2,268,858; Frederick L. Cranford, Inc., $2,325.108; The Underpinning & Foundation Company, $2,369,826; Holbrook, Cabot & Rollins Corporation, $2,466,477; Oscar Daniels Company, $3,378,588.

The commission has approved a contract made by the New York Municipal Railway Corporation with the Empire Construction Company for the installation of tracks and line equipment on the Liberty Avenue extension of the elevated railroad in Brooklyn and on the elevated connection between the Lutheran Cemetery line and the Myrtle Avenue elevated railroads. The Empire Construction Company was the lowest bidder at $115,987.

INTERBOROUGH BASEBALL LEAGUE

Season Concluded with Game Between Interborough Company and Pennsylvania Railroad—Pennant and Medals Awarded

The season of the Interborough Rapid Transit Baseball League, composed of seven teams of employees of the Interborough Rapid Transit Company, New York, was brought to a close on Sept. 19, with a baseball game between the champions of that company and the champions of the Pennsylvania Railroad. After the game a shore dinner was served at Brighton Beach. The teams composing the league were recruited from the car shops, the signal department, subway trainmen, car equipment department, chief engineer's department, transportation department of the Manhattan division and the general office. They finished in this order, the percentage of the winner, the car shop team, being 0.833 with fifteen games won and three lost.

The game between this team and the champions of the Pennsylvania Railroad, representing the purchasing department of that company, was played at Hedley Field at the terminus of the Van Cortland Park branch of the subway. It was witnessed by about 8000 people, including many ladies and 1000 employees of the Pennsylvania Railroad, who traveled from Philadelphia in a special train. The bands composed of employees of both companies were present. Practically all the officers and department heads of the Interborough Rapid Transit Company were at the game and the dinner. The Pennsylvania team, with Morgan pitching and McQuillan catching, beat the Interborough team, with Woods and Smith pitching and Tobin catching. The score was five to four. Pennsylvania scored two each in the first and second innings and one in the fifth, while the Interborough team did all its scoring in the third inning. Three errors were charged against Pennsylvania and four against Interborough. Woods, who started the game for Interborough, was spiked in the first inning in covering the home plate, and retired in favor of Smith. The fielding features were a snappy double play unassisted by the Interborough shortstop in the sixth inning, and a brilliant put out and an assist by the Pennsylvania pitcher in the eighth. Pennsylvania got ten hits and the Interborough seven, with eight and nine strike-outs respectively.

After the game the members of the various Interborough teams and the Pennsylvania team were conveyed by special train to the Atlantic Avenue terminus of the subway in Brooklyn. Here omnibuses were in waiting and carried the party to Brighton Beach, where dinner was served. Theodore P. Shonts, president of the company, acted as toastmaster. He introduced as the first speaker, James A. Farrell, president of the United States Steel Corporation, who took for his subject, "Welfare." Mr. Farrell explained the work of his company along this line. He referred to the protest of 200,000 of the company's men against unjust legislation and said that the ambition of the company was to have the employees take such an interest in the company that all of them would protest against legislative acts detrimental to themselves and to the company.

Luke D. Stapleton, Justice of the Supreme Court of New York, said that it was a refreshing experience to meet men engaged in doing serviceable, vital things for the comfort of the people. He referred to the great industrial growth of the country, but lamented the present journalistic irresponsibility and political chicanery. The future depended upon active, contented men engaged in productive enterprise. Efficiency was not a matter of declaration. He complimented Messrs. Shonts, Hedley, Farrell and Vreeland on their rise, and said that self-made men had no use for the agitator who insisted that opportunities for advancement had vanished.

Simon C. Long, general manager of the Pennsylvania Railroad, reviewed briefly the welfare activities of that company. He said that the Interborough gathering was in itself an evidence of the generosity of the company. H. H. Vreeland, in charge of welfare work of the Interborough Company, referred to his activity in behalf of the employees of the Metropolitan Street Railway, New York, when he was president of that property, and told how it came about that he was selected to direct such work for the Interborough. Athletic sports taught men to be resourceful, a quality much needed in the emergencies of railway work. Men who recognized athletic prowess were likely also to have a keener appreciation of difference in mentality between men than those who had not had the lesson of physical inferiority driven home in athletic competition. Frank Hedley, vice-president and general manager of the company, said that the most perplexing problem of the manager was to obtain men willing to assume responsibility. Daniel M. Brady, of the Brady Brass Company, addressed a few remarks to the athletes. Mr. Shonts concluded the program by presenting the pennant to the winning Interborough team and by pinning the medals on the individual members of the team. He announced that Mr. Hempstead, president of the New York Giants, had signified his willingness to offer special prizes next year to the best individual players on the teams forming the Interborough league.

In addition to those already mentioned, the following gentlemen were among those present at the game and at the dinner: B. A. Hegeman and Charles C. Castle, of the U. S. Metal & Manufacturing Company; Edward A. Maher, vice-president and general manager of the Third Avenue Railway; J. S. Doyle, superintendent of car equipment; George Keegan, assistant to the vice-president and general manager; W. Leon Pepperman, assistant to the president; James L. Quackenbush, general attorney; George H. Pegram, chief engineer, and H. P. Waugh, executive assistant of the Interborough Rapid Transit Company; F. T. Wood, assistant to the vice-president and general manager of the New York Railways, and W. O. Wood, president and general manager of the New York & Queens County Railway.

RAILWAY BUSINESS ASSOCIATION STATEMENT

A statement was authorized by the general executive committee of the Railway Business Association at a meeting held in Chicago on Sept. 16, dealing with the financial emergency urged upon President Wilson by a committee of railway executives and responsively urged by the President in his reply. With this statement has been sent a letter of transmittal to the President, to each Interstate Commerce Commissioner and to members of Congress, especial attention of Senators and Representatives being invited to the following reference to mail pay:

"We would respectfully urge upon Congress that in consideration of railway mail pay the recommendation of the Congressional joint committee points a way whereby the railways may be dealt with in a spirit of greater liberality than is provided in the House bill now under consideration in the Senate. This is surely a time when the government should be actuated by a desire to pay adequately for an important public service rather than to drive a hard bargain with the carriers because it has the power to do so.

"We earnestly hope that the prayer of the railway executives that the roads be relieved as far as possible of further immediate burdens involving additional expense will be heeded by legislative and regulatory bodies and that railway employees will refrain from pressing at this time demands which, if granted, or awarded, would result in higher labor cost."

FAILURE TO ARBITRATE KANSAS STRIKE

The proposition to arbitrate made by officials of the Joplin & Pittsburg Railway, Joplin, Mo., to its striking carmen on Sept. 16, following a decision by the union to break off negotiations looking to a settlement, has been made public by the company. In its proposal the company agreed to leave all points in dispute to an arbitration board comprised of three members, one to be picked by the company from the members of the Public Utilities Commission of Kansas and the Public Service Commission of Missouri, one to be chosen by the union from among the members of the same two bodies and the two thus chosen to select a third. The points in dispute which the company agreed to settle by arbitration are: (a) Section 10, wage scale; (b) Sections 11 and 12, discharge of employees; (c) Section 16, verbal agreements; (d) Section 23, duration of contract; (e) Section 24, agreements on part of the association for protection of the public; (f) Section 25, settlement of disputes.

The proposal contained a provision to embody in the contract all other sections that have been agreed on by the company and the union.

On Sept. 23 suit for receivers for the company was transferred from the District Court of Bramford County, Kansas, to the United States Court at Fort Scott, Kansas. The differences between the company and the men appear to be practically adjusted as a result of conferences on Sept. 23, at which a basis of friendly negotiation was reached.

CLEVELAND EXPENDITURES CRITICISED

Councilman William Stolte has been endeavoring to induce Mayor Newton D. Baker to veto a resolution providing for the installation of fire protection apparatus for the new buildings of the Cleveland (Ohio) Railway at Superior Avenue and East 123d Street. Mr. Stolte said that the buildings will be of fireproof construction and that insurance is provided for, so that there is no need of spending $22,781 for sprinklers.

An ordinance has been prepared for introduction in the East Cleveland Council instructing City Solicitor Binyon to compel the Cleveland Railway to give better service in that village or observe the ordinance which calls for through service to West Ninth Street in the city, with eight-minute service through the day and four-minute service during the rush hours. The village agreed to waive some of the conditions of its contract temporarily in order to allow the city to arrange its schedules satisfactorily, but of late the city has ordered the East Cleveland service greatly reduced. It is intended that the ordinance shall contain a clause forbidding the switching of cars on the street at the Windermere carhouse.

CHANGED POLICY MAY AFFECT OTHER RAILWAYS

The Public Utilities Commission of the District of Columbia has issued an order which is a departure from a previously announced policy of the Interstate Commerce Commission, and which, if followed by the Interstate Commerce Commission in other localities where interurban cars are operated under interstate rules, may affect the latter.

Until a year ago the street railways of Washington were directly under the control of the Interstate Commerce Commission. The Public Utilities Commission then came into existence. It had been the policy of the Interstate Commerce Commission to operate cars under specific schedules during rush hours, and not to require that enough cars should be run to provide all passengers with seats. The Public Utilities Commission on Sept. 15 issued an order suspending existing orders as to headway on the lines of the Capital Traction Company and the Washington Railway & Electric Company from Sept. 16 to Oct. 15, inclusive, with the idea of putting into effect an entirely new plan for controlling service. During the month named the companies will be allowed to fit the service to the traffic under observation of the commission. This observation is to result, it is stated, in the replacing of the old headway regulations for rush hours, with a new order that during non-rush hours a sufficient number of cars be operated to furnish a seat for each passenger and that during rush hours the service shall be such that not more than a specified percentage of passengers shall stand for a limited time.

RAILWAY EXTENSIONS IN WASHINGTON

The Public Utilities Commission of the District of Columbia held a hearing Sept. 15 on a proposal to extend the Fourteenth Street line of the Washington Railway & Electric Company, from the corner of Fourteenth Street and Pennsylvania Avenue, where it now turns into E Street, up Fourteenth Street hill, past the New Willard Hotel, to Fourteenth and F Street, to connect with the Georgetown and Mt. Pleasant lines of the company. This extension is advocated by citizens of Washington employed in the new bureau of printing and engraving on Fourteenth Street Southwest. It was brought out at the hearing, also, that there is need for a loop which will carry the southern terminus of the tracks to the new building of the printing and engraving bureau. It is also advocated that the line be extended east on C Street, north on Linwood Place and west on D Street to Fourteenth, where it will close on itself. It was suggested that if the commission does not allow the extension up Fourteenth Street hill the company be ordered to issue transfers, good a block away. The commission discussed with the railway officials the possibility of removing some of the tracks on E Street, as congestion is charged in consequence of the presence of these tracks. The commission indicated that it will permit the extensions if the tracks on E Street are removed. It is estimated that the proposed extensions will cost about $100,000.

The commission has ordered the Washington Railway & Electric Company to extend its Anacostia or Eleventh Street line from Nichols Avenue and Fourth Street, Anacostia, Washington, along Nichols Avenue to Upsal Street, a distance of half a mile, to be completed and in operation by June 30, 1915, at an approximate cost of $80,000. The company contended that the expense is not justified by the traffic expected, but the commission declared "it is a reasonable extension which promises to be compensatory within a reasonable time."

LOS ANGELES COMMISSION REPORT

Summary of Contents of the Report of the Board of Public Utility Commissioners of Los Angeles for the Year.

The Board of Public Utility Commissioners of Los Angeles, Cal., has issued its fourth annual report covering the period from July 1, 1912, to June 30, 1913. The aim of the report was to give a brief account of the work accomplished and to present the results of preliminary studies and conclusions on questions of importance with which the commission is concerned. The work is divided into four main divisions, namely, work of the department; railroads and carriers, including statistics, finance and operation; other public utilities, including statistics, finance and operation, and applications and complaints. The section covering the operations of the board in regard to electric railways contains operating statistics of the companies within the city and data regarding smoking on cars in other cities, operating statistics of companies in Baltimore, Buffalo, Chicago, Cincinnati, Cleveland, Denver, Detroit, Indianapolis, Kansas City, Louisville, Milwaukee and other cities. A section of the report is devoted to the interurban electric railways which operate in Los Angeles. This contains a summary of the miles of track and data regarding service and routing, types of cars, car signs, fares, transfers, accidents, grade crossings, etc. Regarding the prospect for rapid transit in Los Angeles, the board says in part:

"There is no real rapid transit in the city at present. The interurban lines, even when on private right-of-way, are limited to a moderate speed on account of the many street grade crossings, while all lines use the street in the central portion of the city and some for a considerable distance out. The density of population will hardly warrant the construction of a rapid transit system of elevated lines or subways within the city limits.

"At present the development of rapid transit is left entirely to the Pacific Electric Railway, under regulation by the city. The first step toward construction of a system has been the railway's proposal to build an elevated road east from the rear of Main Street depot to San Julian Street and from there connect with the Municipal Railroad on San Pedro Street by means of a temporary incline. This elevated road will be on private right-of-way. It is the purpose of the board, before recommending any franchise, to have the railway so design the structure that it will be unobjectionable both as regards noise and appearance. It is the intention of the Pacific Electric Railway ultimately to extend this elevated road farther east to connect with the Long Beach line when the latter is elevated, and, though no details have been obtained from the railway, it is assumed that a similar connection will be made with the Pasadena line. Provision should also be made for direct transfer from the steam railroads to the interurban rapid transit system.

"The board has received no official information as to the proposed subway to serve the western beach lines. Newspaper reports indicate that this is to be a combined subway (or tunnel) and elevated, extending from Hill Street, near the location of the present depot between Fourth and Fifth Streets, to Vineyard Junction at the west city limits. No mention has been made of any connection between this proposed subway and the Main Street terminal. The flexibility and efficiency of service obtainable by through routing could thereby be secured. Both this project and the elevated road before mentioned are unsatisfactory in so far as they are based on no general city plan prepared with reference to the present and future needs of the community as a whole.

"There seems to be a popular impression that subways are the ideal means for rapid transit. As a matter of fact instead of being the ideal they should be adopted only as a last resort. In the older cities, laid out before the realization of great centers of population was made possible by modern methods of transportaiton, there is excuse enough for failure to provide ample street space for furnishing facilities to meet the modern demands. We have been entirely too slow in appreciating the conditions made possible through cheap transportation for handling large numbers of people and transporting them long distances, more or less rapidly. The result has been the construction of skyscrapers in the business district with the attendant congestion and then more congestion until the capacity of the streets is thoroughly over-taxed and we are simply submerged. The popular notion is that we will eventually dig ourselves out by way of subways.

"Instead of recognizing the fact that the modern city is absolutely dependent on transportation for its existence, we simply continue in the same old haphazard way, laying out new streets with little or no regard for future requirements. Few, if any, American cities have undertaken in an intelligent and determined way, to study and replan old street systems so that the growing demands for transportation can be met. When it is recognized that a street should be widened in the future an ordinance should be passed at once establishing new street lines to which all future improvements would have to conform, even though it were not actually widened for a number of years."

Compulsory Electrification Measure at Toronto.—The Board of Control of Toronto, Ont., has passed a resolution instructing the corporation counsel to apply to the Dominion Railway Board for an order compelling all railways to electrify their systems within the city limits and 2 miles from the limits.

Electricity Proposed for Harbor-Front Line.—The engineering staff of the harbor board of Montreal, Que., is engaged on plans for an electric railway to replace the present steam line which runs along the harbor front. The plan is to elevate the line. Construction work will not be commenced until next season.

Court Annuls Order of Illinois Utilities Commission—As a result of a suit brought by the Public Utilities Commission of Illinois in the Federal Court to enforce its order to compel the Chicago & Oak Park Elevated Railroad to elevate its tracks in Oak Park, Ill., Federal Judge Kohlsaat has entered a temporarily restraining order.

Providing for Transit Work in Philadelphia.—On Sept. 17 the finance committee of the Councils of Philadelphia inserted in an entirely reconstructed permanent loan bill of $11,300,000 an item of $500,000 for preliminary transit work. The Common Council later received the amended loan ordinance and placed it upon the calendar for final action on Sept. 24.

Boylston Street Subway Opening.—The Boston (Mass.) Elevated Railway is planning to open the Boylston Street subway for service on Saturday, Oct. 3. The subway will be used by single car units operated between the Park Street station and points in the western suburbs of Boston and will relieve the streets of the Back Bay of a highly congested traffic.

Pekin Bond Issue Not Taken.—It now seems very unlikely that the City of Pekin, Ill., will be able to dispose at this time of the issue of 4½ per cent bonds recently voted by the electors to provide funds to take over and extend the Pekin & Petersburg Railway in Pekin as a municipal undertaking. Replies from some of the bond houses solicited indicate that the return proposed is insufficient in view of present financial conditions.

Suit for Paving Tax.—Briefs have been filed with the Illinois Public Utilities Commission by W. E. Orvis, commissioner of the city of Waukegan, Ill., and by representatives of the Chicago & Milwaukee Electric Railroad and Waukegan, Fox Lake & Western Electric Railroad regarding an attempt to inforce the payment of a special paving tax. It is complained that the railways have failed to pay special assessments for paving along the right-of-way and that the waiting rooms are insufficient to accommodate passengers.

Another Storm in Kansas City.—Scarcely had the motors and the substation equipment of the Metropolitan Street Railway, Kansas City, Mo., been dried out after the rain of Sept. 7 when there was another cloudburst. The first rain washed down part of a hill of crushed rock into sewers and into the street near the main station at Fifteenth Street and Grand Avenue. The second rain flooded this station, stopping all the cars in a large district centering in the business section. The station was flooded to a depth of nearly 2 ft. The men worked, at night especially, in drying out and repairing and no accident resulted from the extraordinary strain on the equipment. There was also trouble at the station at Second Street and Grand Avenue, where flood waters shifted the sand which plugged the intake.

Pittsburgh Subway Action.—On Sept. 15 the public service and surveys committee of the Pittsburgh City Council authorized the city law department and A. E. Anderson, attorney representing the Pittsburgh District Railways, to prepare an ordinance for a passenger and freight subway for Pittsburgh, to be presented to the committee. The resolution will then be formally taken before Council. The committee received and filed a communication from the Pittsburgh Subway Company, in which it was stated that that company could not consider competition in building a subway, and requesting permission to build the subway only as a business proposition. Mr. Anderson said his company proposed to develop a freight and passenger subway system in connection with existing transportation lines, at a cost of $32,500,000 for 15 miles of line and equipment.

Recruiting by Electric Car.—The *Electric Railway & Tramway Journal* of Sept. 11, published in London, contained the following interesting item: "The Lord Mayor of Leeds and his colleagues are utilizing the Corporation cars for recruiting purposes. Every night a procession of cars sets out on a recruiting trip, the passengers being the Lord Mayor, the other members of the Corporation, and prominent local citizens, and they are accompanied by the Corporation bandsmen, playing local airs. At certain points of the system speeches are made calling on men to enlist themselves in Lord Kitchener's army. Accommodation is provided on the cars for recruits, who are taken by this means to the recruiting office. The illuminated car which leads the procession bears, as the destination, the name 'Berlin,' and these are the inscriptions which meet the eye: 'Wanted at once, 5000 recruits from Leeds, British Bulldogs, Airedale and Yorkshire Terriers'; and 'Come now, don't have to be fetched. The people of Leeds will look after your homes.'"

Seattle Purchase Negotiations.—The proposed terms for the purchase by the city of Seattle, Wash., of that portion of the Seattle, Renton & Southern Railway within the city limits were discussed at a conference on Sept. 12 between the members of the City Council and William R. Crawford and Scott Calhoun, receivers of the company. The most recent plan provided for an initial payment of $200,000 in municipal street railway bonds, bearing 4½ per cent interest, and an annual payment of 25 per cent of the gross earnings for twenty-five years on the remaining $1,400,000 of the purchase price, the title to the property to pass to the city whether or not such payment liquidated the remaining indebtedness. A change has been made in the terms by which the receivers will accept 20 per cent of the gross receipts for twenty-eight years instead of 25 per cent for twenty-five years. The receivers will apply to the court for permission to accept these terms. An ordinance providing for the purchase will then be drawn and offered in the Council, and it is expected that the question will be submitted to the voters at the election on Nov. 3.

Financial and Corporate

RECENT FINANCIAL TENDENCY

The improvement in financial conditions during the last week has been general but not marked. The exports of merchandise from New York for the week ended Sept. 19 amounted to $17,208,199, against $13,906,351 the previous week. The success of the New York City loan also had a stabilizing effect. The situation in London is better. The stock exchange committee there has fixed special settlements in thirty-eight new securities for Oct. 14 and it has been decided that there shall be no further extension of the moratorium as it applies to certain debts. These last factors in particular are taken to augur well for the opening of the exchange in London about the middle of October. The committee of seven bond dealers in New York has modified the restriction previously imposed upon bond trading. It is now possible to trade in bonds at lower prices than the last quotations of the stock exchange, but in the case of listed bonds, trades at reduction in prices from those of July 31 have to be made subject to the approval of the Stock Exchange committee. Brokers are making every effort to obtain larger margins from their customers with the result that the margin accounts are being gradually lessened and the bank loans reduced. On Sept. 22 the committee of the clearing house of the Stock Exchange announced the settlement of all contracts which were entered on the clearing house sheets dated July 31, 1914, with the exception of those made by the three firms whose affairs were placed in the hands of receivers when the Exchange closed. The question of opening the Exchange continues to be discussed, but nothing has developed which would indicate that the governors have in any way changed their views toward opening. The war tax revenue bill as agreed upon by the democrats of the ways and means committee was introduced in the House on Sept. 21 by Representative Underwood, the majority party leader. It is estimated that in the first year of operation $105,000,000 in revenues will accrue to the treasury under this measure. The bill reimposes most of the stamp taxes of the Spanish-American war and increases the tax on beer and wines.

PROTECTIVE COMMITTEE IN BIRMINGHAM

On account of the default in the payment of interest due Sept. 1 on the $2,650,000 of first mortgage 5's of the Birmingham, Ensley & Bessemer Railroad, Birmingham, Ala., as noted in the ELECTRIC RAILWAY JOURNAL of Sept. 12, a protective committee has been formed as follows: C. H. Zehnder, S. D. Vrooman, J. D. Kirkpatrick and F. H. Hack. This committee urges the deposit of bonds with the Empire Trust Company, New York, depositary, under an agreement dated Sept. 15. In case the committee adopts any plan of reorganization the depositors will be allowed three weeks in which to withdraw on payment of their pro rata share in the expenses, not exceeding 2½ per cent per bond. If the reorganization plan calls for the issue of mortgage bonds, the depositors are to receive not less than $700 for each $1,000 bond deposited.

As noted in the ELECTRIC RAILWAY JOURNAL of Sept. 19, an independent committee has also been formed, consisting of the following: S. H. Cunningham, investment banker, Boston; Oscar Dare, bond broker, Philadelphia; Boyd McDowell, corporation counsel for the city of Elmira, N. Y.; J. H. N. Campbell, of H. K. Taylor & Company, investment bankers, Hartford, Conn., and George T. Wood, of Wood & Johnson, investment bankers, Louisville, Ky. This committee requests that bondholders take no action in regard to depositing bonds until its investigations are completed.

According to a circular recently sent out by the Cunningham committee, a meeting of bondholders was held in New York on Sept. 11. The action of Mr. Cunningham in employing Stone & Webster to make an examination of the books and accounts of the company with reference to the disposition of the proceeds of security issues was approved. It was also voted to authorize this independent bondholders' committee to examine the road's finances, to endeavor to ascertain the causes of the receivership and to employ counsel to protect the rights of the owners. As stated in last week's issue, the company is now in the hands of General Superintendent I. W. Ross as receiver.

ANNUAL REPORT

Interborough-Metropolitan Company

The income statement of the Interborough-Metropolitan Company, New York, for the year ended June 30 follows:

Surplus income June 30, 1913	$3,595,321
Income:	
Dividends on Interborough Rapid Transit Company capital stock, viz.:	
2½ per cent for three months ended Sept. 30, 1913	$847,820
2½ per cent for three months ended Dec. 31, 1913	847,820
2½ per cent for three months ended March 31, 1914	847,820
2½ per cent for three months ended June 30, 1914	847,820
5 per cent extra paid July 1, 1914	1,695,640
Total	$5,086,920
Interest and dividends on other securities owned	$2,081
Interest on loans and advances to Metropolitan Securities Company	353,328
Interest on loans and bank balances	20,573
Total	$375,982
Total income	$5,462,902
	$9,058,223
Disbursements:	
Interest on $67,825,000 of Interborough-Metropolitan Company 4½ per cent collateral trust bonds, for the year ended June 30, 1914	$3,052,125
Administration and general expense account	55,801
Taxes	40,085
Interest on 6 per cent registered notes to June 30, 1914	116,216
Interest on five-year 6 per cent notes	240,000
Interest on two-year 6 per cent secured gold notes to Dec. 22, 1913	51,785
Interest on six months' 6 per cent secured gold notes to June 22, 1914	45,000
Interest on loans	1,125
Total	$3,602,137
Surplus income	$5,456,086

The report states that the surplus from operations of the Interborough Rapid Transit Company, of whose capital stock the Interborough-Metropolitan Company owns 339,128 shares out of a total of 350,000, was $8,024,580 for the year ended June 30, an increase of $1,487,512. There has been a continued increase in the earnings of this property, the net corporate income for 1914 being equivalent to 22.92 per cent on the capital stock, as compared to 16.68 for 1913, 16.07 for 1912 and 14.68 for 1911.

The net corporate income of the New York Railways, which is also controlled by the Interborough-Metropolitan Company, has not yet been sufficient to enable the payment of the full interest on the company's 5 per cent adjustment bonds. It is stated that the earnings during the year were adversely affected by the severe weather conditions of February and March and by the lower temperatures prevailing from April to June. Added to this was the general business depression and the many interruptions to service caused by the new subway construction. The expenditures for maintenance during the year, however, were $2,444,395, an increase of $336,071 over those of the preceding year.

The $2,039,520 of six months' 6 per cent registered notes dated Jan. 1, 1913, were extended and reduced during 1914 to $1,936,942, and the funds necessary for the retirement of the full amount on July 1 were on deposit at the close of the fiscal year. The indebtedness represented by the two-year 6 per cent secured notes dated Dec. 22, 1911, amounting on June 30, 1913, to $1,817,000, was reduced to $1,500,000. Arrangements have been made whereby this sum will be further decreased to $500,000 as of July 1, 1914, thus reducing the funded debt from $7,856,520 to $4,500,000. The report states that consideration is also being given to a plan for refunding this latter amount.

CHICAGO RAILWAY STATISTICS

Report of Board of Supervising Engineers Chicago Traction, Showing Progress of Surface Lines for 1911

According to the fifth annual report of the Board of Supervising Engineers Chicago Traction, covering the fiscal year ended Jan. 31, 1912, the gross receipts of the city surface lines totaled $28,743,167, an increase of about $3,710,452, or 14.7 per cent. In the assignment of the total income to the various accounts, the proportion of operating expenses proper, 62.46 per cent; the total return to the company (interest and profit), 26.28 per cent; and the total return to the public (taxes and profit), 11.26 per cent, remained practically constant from the preceding year, in spite of the large increase in the reserve for renewals and some increase in taxes. For the fiscal year the operating ratio and taxes (based upon earnings from operation) was 68.2 per cent, leaving 31.8 per cent net earnings, or $9,007,441. Expenditures for maintenance of way and equipment remained practically the same as in 1910, but decreased in percentage 9.07 per cent. The decrease, however, was more than offset by the increase in the reserve for renewals from 2.47 per cent in 1910 to 8.05 per cent in 1911, thus increasing the total appropriation for upkeep from 12.73 per cent to 17.1 per cent of the earnings from operation.

The expenditures for damages showed a decrease averaging 6.03 per cent for all companies. Taxes and interest were fairly constant in percentage. The company's share in the profits, including interest, remained at about 26.75 per cent of the gross earnings for the last two years. The total cash income to the public represented $3,235,592, or 11.42 per cent of the operating revenue. The value of the property increased $8,866,566 during the year to a total of $127,492,398. The properties have earned under the 1907 ordinances a total of $116,130,142, or an average of $23,230,000 per year. The investment ratio between capital and receipts during the past five years' operation increased from 3.28 per cent in 1907 to 4.47 in 1910, but during the last fiscal year decreased from 4.74 per cent to 4.44 per cent. The old mileage of the system, 907.32 miles of single track, has increased 189.23 miles, of which 59.47 represents new extensions. The extensions of mileage in sparsely settled territory, even in the face of rapidly increasing returns, has reduced the average per mile to about $31,800, or 13.8 per cent lower than in 1907. It also resulted in a decrease of 21.9 per cent in density of car operation (car miles per mile of track) over the entire system.

The revenue fare averaged 4.84 cents for the year. The service factor increased to 9.66 total passengers per car mile, while the operating revenue per car mile rose to 28.36 cents. Wages of train crews increased from 52.1 cents per car hour in 1907 to 59.25 cents in 1911, an increase of 13.7 per cent. In per cent of total operating expenses, however, the relative cost has remained almost constant at 39 per cent, largely owing to a gradual increase in the schedule speed to 8.9 miles per hour by improved equipment. On a car mile basis, maintenance of equipment remained constant for the last two years at 1.49 per cent per car mile. The total upkeep of the system, excluding the reserve for renewals, has increased to 4.85 cents per car mile. Maintenance of way and structures is about $1,200 per mile of track, or, including both maintenance and renewals, $5,355.

COMPLETION OF UTAH MERGER

On Sept. 18 the stockholders of the Utah Light & Railway Company, Salt Lake City, Utah, approved the sale of the properties of the company to the Utah Light & Traction Company, incorporated by officials of the Utah Power & Light Company. The Utah Light & Traction Company becomes the owner of the 98 per cent interest in the common and the preferred stocks of the Utah Light & Railway Company owned by the Union Pacific interests through the Oregon Short Line. The acquisition gives control of the electric power business in both Salt Lake City and Ogden to the Utah Power & Light Company. The new company, the Utah Light & Traction Company, has elected officers as follows: O. J. Salisbury, president; C. W. Johnson, Salt Lake City, R. C. Gemmell, Salt Lake City, and C. E. Groesbeck, New York City, vice-presidents; S. A. Whitney, Salt Lake City, treasurer; E. O. Howard, Salt Lake City, assistant treasurer; E. R. Summerson, New York, assistant treasurer; A. H. Parsons, Salt Lake City, secretary; J. N. Bidwell, Salt Lake City, assistant secretary; L. W. Osborne, New York, assistant secretary. The directors of the new company are O. J. Salisbury, S. A. Whitney, A. H. Parsons, C. W. Johnson, R. C. Gemmell, J. N. Bidwell, E. O. Howard, J. Frank Judge and Joseph S. Wells, the general manager of the Utah Light & Railway Company. It is said that the lighting, street railway and power interests of the Utah Light & Traction Company will be separated. The lighting end will probably remain with the present company and the power business will be taken over by the Utah Power & Light Company, which will contract to furnish current for lighting and for the operation of the street railway system. It is also stated unofficially that P. B. Sawyer, the present general manager of the Utah Power & Light Company, will be named as general manager of the Utah Light & Traction Company and will become the active operating head of the new company. The Utah Light & Traction Company, the new company, is capitalized at $10,000,000. The stock is divided into 400,000 shares with a par value of $25 each.

Alabama Traction, Light & Power Company, Ltd., New York, N. Y.—The directors of the Alabama Traction Light & Power Company recently announced in London that prior to the outbreak of European hostilities arrangements had been made for the payment of interest due on Sept. 1 on the first mortgage 5 per cent bonds, of which $10,914,000 is said to be outstanding. Under present stock exchange and moratorium conditions, however, the board is compelled to defer this interest payment. Bondholders are assured that the step taken is only temporary and is dictated by the necessity for most carefully conserving the cash resources of the company.

Capital Traction Company, Washington, D. C.—A quarterly dividend of 1¼ per cent has been declared on the $12,000,000 of capital stock of the Capital Traction Company, payable on Oct. 1. This compares with a 1½ per cent quarterly dividend from April, 1905, to July, 1914, inclusive. According to a notice to the stockholders, during the last three years there has been a large increase in fixed charges through compulsory extensions and complete new equipment for cars which, while giving proper comfort and convenience to the public, brought no commensurate increase in the receipts. During the present year the passenger receipts decreased on account of the general business depression. In view of these facts, the directors decided upon a reduction in the rate of dividend, although with the improvement in general conditions now foreshadowed, the return to a 6 per cent basis is confidently expected.

City Light & Traction Company, Sedalia, Mo.—The Public Service Commission of Missouri recently authorized the City Light & Traction Company to issue $91,600 of first mortgage sinking fund gold bonds maturing June 1, 1952, but redeemable any June 1 or Dec. 1 at 105 and interest. These bonds bear 5 per cent interest, payable semi-annually. The proceeds are to be used in partial reimbursement for moneys already expended for improvements.

Elmira Water, Light & Railroad Company, Elmira, N. Y.—Bertron, Griscom & Company, New York, recently sold $284,000 of five-year 6 per cent collateral trust bonds of the Elmira Water, Light & Railroad Company, which are secured by $355,000 of consolidated mortgage 5's, due 1956. The proceeds of this issue and $85,000 of 7 per cent first preferred stock will be used chiefly to pay off $355,000 of West Side Railroad first 5's, due Oct. 1. All the stockholders of record Sept. 15 are offered the right to subscribe at par for $425,000 of additional first preferred stock to be issued Oct. 1, of which the above mentioned $85,000 is a part.

Houghton County Traction Company, Houghton, Mich.—The directors of the Houghton County Traction Company have voted to omit the semi-annual dividend on the $750,000 of common stock payable on Oct. 1. From April, 1910, to April, 1914, 2½ per cent was paid semi-annually and in October, 1909, 2 per cent.

Hudson & Manhattan Railroad, New York, N. Y.—The Board of Public Utility Commissioners of New Jersey has authorized the Hudson & Manhattan Railroad to issue $202,500 of first lien and refunding mortgage bonds. These bonds were previously authorized by the Public Service Commission for the First District of New York, as noted in the ELECTRIC RAILWAY JOURNAL of Aug. 8.

Kansas City (Mo.) Railways.—Robert J. Dunham, vice-president Armour & Company, has been elected president of the Kansas City Railways, the successor of the Metropolitan Street Railway, Kansas City, Mo. Ford Harvey and E. E. Ball, of Kansas City, were elected vice-president and secretary and treasurer respectively. The completion of the company's reorganization still remains in abeyance pending a final settlement as to the valuation of the properties and a return of better financial conditions. It is understood that the company's reorganization plan will at the proper time be brought out by the holders of the Kansas City Railway & Light Company 6 per cent notes, with the co-operation of interests representing the bondholders. A statement outlining the situation will be sent to the noteholders within the next month.

New York State Railways, Rochester, N. Y.—The directors of the New York State Railways have declared the regular quarterly dividend of 1¼ per cent on the preferred stock and a quarterly dividend of 1 per cent on the common stock, payable on Oct. 1, to stockholders of record Sept. 22. This is a reduction of one-half of 1 per cent from the last quarterly payment on the common stock.

Pacific Gas & Electric Company, San Francisco, Cal.—The California Railroad Commission on Sept. 10 authorized the Pacific Gas & Electric Company to issue $1,000,000 of general and refunding mortgage bonds. The company proposes to pledge the bonds to secure its securities on two bonds which it must file in the Federal Court in connection with suits brought to enjoin the enforcement of the gas and electric rates fixed by the San Francisco Board of Supervisors for the year ended June 30.

Philadelphia Company, Pittsburgh, Pa.—The Philadelphia Company has declared its regular semi-annual dividend of 3 per cent on the preferred stock and the regular quarterly dividend of 1¾ per cent on the common stock. These dividends are payable in script Nov. 2 to stock of record Oct. 1. The script will be redeemable at the option of the company on or before May 1, 1916, and will bear 7 per cent interest.

Public Service Corporation of New Jersey, Newark, N. J.—At a recent meeting of the board of directors of the Public Service Corporation of New Jersey, President Thomas N. McCarter stated that while a large number of steam railroads and utilities showed decreases in gross earnings the Public Service Corporation for the first eight months of 1914 made actual increases. Although not so large as normally, they were very gratifying when compared with the results obtained from similar properties. The way the company stood up during this year and also during the period of depression in 1907 evidences the inherent strength of the properties and also indicates that its securities will make a greater appeal than ever to the investing public when business conditions reach a normal state.

San Francisco-Oakland Terminal Railways, Oakland, Cal.—George K. Weeks, manager of the San Francisco branch of N. W. Halsey & Company, has been elected president of the San Francisco-Oakland Terminal Railways to succeed W. A. Bissell. This election leaves the control of the property in the hands of the bankers who held the $2,500,000 of Oakland Railways 6's of 1912, originally due in June, 1913, but extended to Sept. 14. It is reported that the further extension of these bonds has been refused.

Sherbrook Railway & Power Company, Sherbrook, Que.—The gross income of the Sherbrook Railway & Power Company for 1914 showed a gain of $15,344, or 12.13 per cent, while the net earnings gained only $2,093, or 4.3 per cent. This was due to the fact that the operating expenses amounted to $87,970, an increase of $13,251, or 17.7 per cent. A small deficit was shown on the year's operation. C. J. McCuaig, president, says: "The industrial depression in the Dominion of Canada during the last eighteen months has affected both the street railway earnings and the power revenue. The prospects, however, for increased earnings in 1915 are as favorable as can be expected."

Tidewater Southern Railway, Stockton, Cal.—L. M. Rosenbaum, New York, is offering at 85 and interest the unsold portion of $750,000 of first mortgage thirty-year 5 per cent sinking fund gold bonds of the Tidewater Southern Railway, dated 1912 and due April 15, 1942, but redeemable on any interest date at 103 and interest. This is a projected road from Stockton to Fresno, 227 miles in length, of which 33 miles from Stockton to Atlanta, Escalon and Modesto were completed and in operation in May, 1914.

United Gas & Electric Corporation, New York, N. Y.—The United Gas & Electric Corporation has passed the October dividend on its first preferred stock owing to present financial depression, although it is stated that the dividend has been fully earned.

Union Traction Company, Philadelphia, Pa.—According to the report presented by Jeremiah J. Sullivan, president, at the annual meeting of the Union Traction Company on Sept. 16, the board of directors on June 1 consented to the immediate circulation and issue of $2,000,000 of the bonds secured by the deed of trust of March 1, 1912, between the Philadelphia Rapid Transit Company, the Union Trust Company and the Commercial Trust Company, trustee. A total of $8,000,000 of bonds has now been issued under this deed of trust.

Washington Water Power Company, Spokane, Wash.—The directors of the Washington Water Power Company have declared a quarterly dividend of 1¾ per cent on the $14,081,900 of stock, payable on Oct. 1 to holders of record Sept. 12. This compares with 2 per cent paid from April, 1911, to July, 1914, inclusive.

DIVIDENDS DECLARED

Bangor Railway & Electric Company, Bangor, Maine, quarterly, 1¾ per cent, preferred.

Brazilian Traction, Light & Power Company, Ltd., Toronto, Ont., quarterly, 1½ per cent, preferred.

Capital Traction Company, Washington, D. C., quarterly, 1¼ per cent.

Cincinnati & Hamilton Traction Company, Cincinnati, Ohio, quarterly, 1¼ per cent, preferred; quarterly, 1 per cent, common.

Cleveland (Ohio) Railway, quarterly, 1½ per cent.

Columbus Railway, Power & Light Company, Columbus, Ohio, quarterly, 1½ per cent, preferred.

Dallas (Tex.) Electric Company, semi-annual, $3, first preferred; semi-annual, $2.50, second preferred.

Germantown Passenger Railway, Philadelphia, Pa., quarterly, $1.31¼.

Houghton County Traction Company, Houghton, Mich., 3 per cent, preferred.

Illinois Traction System, Peoria, Ill., quarterly, 1½ per cent, preferred.

New Orleans Railway & Light Company, New Orleans, La., quarterly, 1¼ per cent, preferred.

New York State Railways, Rochester, N. Y., quarterly, 1¼ per cent, preferred; quarterly, 1 per cent, common.

Omaha & Council Bluffs Street Railway, Omaha, Neb., quarterly, 1¼ per cent, common and preferred.

Philadelphia (Pa.) Traction Company, $2.

Public Service Corporation of New Jersey, Newark, N. J., quarterly, 1½ per cent.

Republic Railway & Light Company, New York, N. Y., quarterly, 1½ per cent, preferred.

Stark Electric Railroad, Alliance, Ohio, quarterly, three-quarters of 1 per cent.

Toronto (Ont.) Railway, quarterly, 2 per cent.

Washington Water Power Company, Spokane, Wash., quarterly, 1¾ per cent.

West India Electric Company, Ltd., Kingston, Jamaica, quarterly, 1¼ per cent.

Traffic and Transportation

NEW YORK SUBWAY PASSENGER DETAILS

From official figures made public by the Public Service Commission of the First District of New York as to the number of passengers carried by the subway in the year ended June 30, it appears that for the first time the Interborough Rapid Transit Company has handled on the average 1,000,000 passengers a day. Taking Sundays as half days and reckoning 340 days to the year, the company carried 340,413,103 passengers, an increase over 1913 of 12,941,593, or an average of 1,001,215. The details of the passenger traffic, as indicated by the number of tickets sold at each station of the subway in the year ended June 30, 1914, follow:

Stations	Total	Year's increase	Daily average* 1914	1913	1912
Lenox Branch—Total	66,471,446	2,962,849	195,504	186,790	171,075

MIDDLESEX & BOSTON FARE HEARING

At a continued hearing before the Massachusetts Public Service Commission on the petition of the Middlesex & Boston Street Railway for authority to increase existing 5-cent fares to 6 cents and to impose a further 1-cent charge for transfers, C. B. Breed, professor of civil engineering at the Massachusetts Institute of Technology, Boston, appeared on behalf of the remonstrants. Professor Breed

contended that by capitalizing floating debts and by rehabilitating its power plants in Lexington and Newton and discontinuing the purchase of energy at these points from the Edison Electric Illuminating Company of Boston, the railway company could save 0.5 cent per kw-hr. In response to an inquiry by Commissioner Anderson as to whether it was advisable for the railway company to invest $250,000 in plant improvements many miles from tidewater, Professor Breed said that he had not studied the situation sufficiently to give an answer. Commissioner Anderson said that a company with a floating debt of $1,500,000 is in no position to invest in plant restoration.

Before the final arguments, a protracted discussion of the transfer situation occurred. George M. Cox, general manager of the company, emphasized the evils of giving a transfer on a transfer and said that it had never been done on the Newton lines and never would be if it could be helped. Chairman McLeod said that in cases where a through service is rendered during a portion of the day for a single fare, the company should provide for a ride between such points at other hours by the use of transfers when cars are not operated to the former terminals. The benefits of operating through cars at reduced rates to and from factories were also touched upon.

In his closing argument, Attorney Ballantine reiterated the company's inability to pay any dividends in case its revenue is not increased. He urged that 5-cent fare restrictions made twenty or more years ago in connection with the granting of local franchises are not binding upon the commission and pointed out that it would be contrary to the policy and laws of the State to require the stockholders to bear losses upon property formerly necessary for service but later abandoned, as in the case of the old power plants. Such a policy would result in a continued use of inadequate or unsuitable equipment and would militate against good service. The total investment in the property, every dollar of which has been under commission authorization, is $4,781,521. The board took the case under advisement.

EXTENSION OF TRANSFER PRIVILEGES AT BOSTON

The Massachusetts Public Service Commission has issued an order approving various extensions of transfer privileges on the Boston Elevated Railway in connection with the forthcoming opening of the Boylston Street subway. In general, these facilities provide for a free interchange of passengers between inward cars and a corresponding interchange between outward cars and for the articulation of surface and subway routes to give a continuous ride in the same general direction for a single fare. The most important transfer point in the new subway will be the Massachusetts station, in the outer Back Bay. This station is located substantially at the intersection of Massachusetts Avenue and Boylston Street, one of the most important intersection points on the system, with liberal transfer facilities prevailing between east and west and north and south lines of surface cars. With the opening of the subway this fall transfer checks will be issued from inward bound Ipswich Street, Harvard Bridge, Cambridge-Cottage Farm Bridge and Commonwealth Avenue surface cars to inward-bound subway cars. Transfers will also be issued on outward-bound surface cars to outward-bound subway cars, west of the Public Garden. Checks will also be issued from outward-bound cars in the subway to outward-bound surface cars and from inward-bound subway cars to crosstown and inward Copley Square surface cars. At various points in Allston, Brighton and Brookline transfers will be issued to permit interchange of traffic between various intersecting or coinciding suburban routes, with special reference to the use of the trunk lines leading in and out of the Boylston Street subway by passengers whose origins or destinations are located on branch lines or lateral routes. At the Watertown carhouse a system of transfers will be instituted between Cambridge and Newton surface cars which will enable the company to eliminate an overlapping service on about 1 mile of track on Galen Street and also to reduce congestion in Nonantum Square, Newton. It is expected that the running time from Nonantum Square to Park Street, Boston, via the Boylston Street subway, will be about twenty-five minutes, compared with about thirty-five minutes under present light-hour conditions. The subway will probably save about ten minutes per trip for inward and outward Back Bay passengers traveling to or from the Park Street station.

Reduction in Fare Refused.—C. H. Rinker, superintendent of the St. Paul (Minn.) City Railway, has informed Councilman Oscar E. Keller, commissioner of public utilities, that the Twin City Rapid Transit Company will not agree to make a 5-cent fare from St. Paul to the Soldiers' home.

Accident Fakir Sentenced.—Frank J. Marter, Shermansdale, Pa., arrested on Sept. 5 for faking a claim of $1,500 for alleged personal injuries while alighting from a subway train of the Philadelphia Rapid Transit Company, pleaded guilty of perjury and was sentenced to nine months in the county prison by Judge Searle in Philadelphia on Sept. 17. The apprehension of Marter was noted in the ELECTRIC RAILWAY JOURNAL of Sept. 12, page 503.

Increase in Fare on Municipal Line Proposed.—J. J. Hackney, commissioner for Port Arthur, and A. McNaughton, superintendent of light, power and railways for Fort William, Ont., have been appointed a committee to consider the advisability of increasing the rate of ordinary tickets of the municipal street railway system from six for 25 cents to 5 cents straight. This would not interfere with children's or workmen's tickets, and, it is calculated, would result in a 20 per cent increase in revenue.

Steam Service Discontinued on Account of Trolley Competition.—The Massachusetts Public Service Commission has issued an order authorizing the discontinuance of passenger train service between Milford, Hopkinton and Ashland by the New York, New Haven & Hartford Railroad. A trial service of one train a day in each direction since June 8 resulted in an average patronage of only one passenger a train, yielding a revenue of $6 a month against an operating cost of $660. The small patronage is due to the fact that the Middlesex & Boston Street Railway and the Milford & Uxbridge Street Railway furnish a more convenient and cheaper service between the points at issue.

Citizens' Hand Book of Safety.—On July 4 the Boy Scouts of Akron distributed to every home in Akron, Ohio, a booklet on "safety first" called the "Citizens' Hand-Book of Safety." This booklet contained thirty-two pages, including the cover, and took up the safety movement in all its phases. References were made to safety on the streets, safety to the children in the home, safety in the workshop, etc. The Northern Ohio Traction & Light Company was represented in the pamphlet by two pages, one headed, "Six for a Quarter" and the other "Ninety-three Per Cent of All Trolley Accidents Are Due to Failure of the Human Element." On the page headed "Six for a Quarter" half-tone illustrations were used to show accidents to passengers who get off a car backward, walk blindly past the rear of the car, jump from a moving car, sit with their feet out of the window or expectorate on the floor. The publication contained advertisements of manufacturers and others in Akron who carry in stock goods helpful in preventing accidents and in dealing with those that have occurred.

New Company Publication.—The publication of *Transit*, a monthly magazine, has been begun in the interest of the Lehigh Valley Transit Company, Allentown, Pa., and the Philadelphia & Western Railway, Upper Darby, Pa. Each month it is planned to feature one of the cities or towns along the lines, having in mind the location of factories and residences. Company departments and the work they are doing will also be featured each month. The magazine will also contain such other matters as the companies desire to bring before the public. The circulation will be 50,000 copies each month. The paper will be distributed in Philadelphia and for a distance of 100 miles north. The magazine is being issued by the publisher without expense to the companies, but the advisory committee has agreed to furnish the reading matter. It will contain the complete operating schedules of both companies corrected each month. The companies expect to cut down materially their time-table expense and their advertising account in the daily papers. The idea of publishing the magazine was perfected by Edward C. Spring, manager of the Philadelphia Division of the Lehigh Valley Transit Company.

Personal Mention

Mr. John L. Terry has resigned as general manager of the Denver, Laramie & Northwestern Railroad, effective on Oct. 1, to become connected with the Denver office of the Rail Joint Company, New York.

Mr. G. K. Weeks has been elected president of the San Francisco-Oakland Terminal Railways, Oakland, Cal., succeeding Mr. W. A. Bissell, resigned. Mr. Mortimer Fleishacker has been elected a director of the company to succeed Mr. Bissell.

Mr. David Van Alstyne has been appointed assistant to the vice-president of operation of the New York, New Haven & Hartford Railroad, with headquarters in New York, in charge of the test and store departments, and of handling scrap. Mr. Van Alstyne will also have supervisory authority over the mechanical department in regard to organization, shop practice, approval of design, standards and requisitions.

Mr. W. B. Voth, whose appointment as chief engineer of the Empire United Railways with headquarters at Syracuse, N. Y., was noted in the ELECTRIC RAILWAY JOURNAL of Sept. 19, was graduated from the engineering department of the University of Wisconsin in 1897. He engaged in civil engineering work in Milwaukee and later in light and power work in Baraboo, Wis., and in railway construction in Madison, Wis. He also erected and operated a number of small lighting plants elsewhere in that State. Subsequently Mr. Voth became connected with the Sheboygan Railway & Electric Company, Sheboygan, Wis., and while with that company supervised the construction of a new power house and 10 miles of railway extensions and rebuilt the light and power lines, changing the system from 133 to sixty cycles. After completing this work he continued with the company as superintendent of the light and power department and as engineer for the system.

Mr. J. W. Macdonald, who since the formation of the Board of Supervising Engineers, Chicago Traction, has served as inspector of cars under construction and being rehabilitated, has resigned to become assistant to Mr. R. F. Kelker, Jr., supervising expert in charge of the traction bureau of Chicago's department of public service. Mr. Macdonald received his electrical engineering education in the International Correspondence Schools, the Bliss Electrical School, Washington, D. C., and the Brooklyn Polytechnic Institute. His experience includes service with the New York Edison Company, in the meter and testing department, the Union Terminal Company, New York, in the mechanical design department, the Manhattan Elevated Railroad, New York, for which he supervised the work of equipping of the subway cars, and later with the Interborough Rapid Transit's mechanical department. At the commencement of the electrification of the New York Central & Hudson River Railroad terminals in New York he accepted a position with that company, in charge of equipping its new steel cars. He resigned from the New York Central in 1907 to become chief car inspector with the Board of Supervising Engineers, Chicago Traction.

OBITUARY

William H. McClure, purchasing agent of the Louisville (Ky.) Railway, died at his home in that city Sept. 17 after a long illness, dating from a nervous breakdown several years ago. Mr. McClure was sixty-three years of age. He was born in Martinsville, Ind., and twenty-five years ago became secretary to Mr. T. J. Minary, president of the Louisville Railway. A few years later he was made purchasing agent of the company. One daughter, Mrs. Katherine McClure James, and one son, Tarleton McClure, St. Louis, survive.

James Arthur Noble, president of the Ackley Brake & Supply Company, New York, N. Y., was drowned at Yardley, Pa., on Sept. 5. Mr. Noble was twenty-four years old. He was graduated from the University of Chicago, studied at Columbia University and matriculated at Oxford. He became connected with the Ackley Brake & Supply Company as treasurer, and in 1913 was elected president. In November last he was married to Miss Ethel Louise Ackley, only daughter of Mr. G. S. Ackley, formerly president of the company.

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

RECENT INCORPORATIONS

***Florence & Huntsville Interurban Railway, Florence, Ala.**—Incorporated in Alabama to build a 60-mile electric railway from Florence to Huntsville. There will be a branch line from Killen via Arkdale to Lexington, with the ultimate intention of extending to Pulaski, Tenn. Officers: Thurston H. Allen, president; T. W. Pratt, vice-president, and N. F. Thompson, secretary-treasurer. The directors are the same as those of the Allentown Power Company.

***Mountain Central Railroad, Clay City, Ky.**—Application for a charter has been made by this company in Kentucky to build an electric or steam 12½-mile railway from Campton Junction to Campton. Capital stock, $25,000. Incorporators: Floyd Day and J. C. M. Day, Winchester, Ky.; E. B. McGlone, J. Harrison O'Rear, C. M. Clark and Luther Loving.

***Hamlin & Guyandotte Railroad, Charleston, W. Va.**—Chartered in West Virginia to build an interurban railway from a point at or near Hamlin, W. Va., to a point near West Hamilton, Lincoln County, on the Guyandotte River. Capital stock, $50,000. Incorporators: L. R. Sweetland, Hamlin, and J. W. Dingess, Huntington.

FRANCHISES

Clovis, Cal.—The Fresno Interurban Railway has received a franchise from the Council in Clovis.

Fresno, Cal.—J. B. Rogers, representing the Fresno Interurban Railway, has asked the Board of Supervisors for a franchise to build a 1½-mile extension in Fresno from Fresno Avenue to the Normal School. Right-of-way is being secured and a portion of the bonus desired has been subscribed.

Los Angeles, Cal.—The Pacific Electric Railway has received a franchise from the Council to build three spur tracks in Los Angeles.

Los Angeles, Cal.—W. E. Dunn, vice-president of the Los Angeles Railway, has assured the committee of the Malabar Improvement Association that he will accept the franchise from them and build the electric line on North Evergreen Street, from East First to Wabash; thence through the Hills to Eastlake Park in Los Angeles.

Murphysboro, Ill.—The Murphysboro & Southern Illinois Railway has received a franchise from the Council to operate over the local lines in Murphysboro. This is part of a plan to build an electric railway between Murphysboro and Carbondale, a distance of 7 miles. A. B. Minton, Murphysboro, president. [E. R. J., Sept. 21, '14.]

Middlesboro, Ky.—Godfrey Hunter has secured a franchise from the Council to build a 5½-mile electric railway to connect Middlesboro and adjoining towns. [E. R. J., July 11, '14.]

Pittsfield, Mass.—The Berkshire Street Railway has asked the Council for a franchise to relay its tracks from White Terrace to a point south of St. Joseph's church in Pittsfield. Work will be begun at once.

Winchendon Springs, Mass.—The Northern Massachusetts Street Railway has asked the Council for a franchise for an extension to Winchendon Springs.

North Tonawanda, N. Y.—The International Railway has received a franchise from the Councils in Tonawanda and North Tonawanda.

Albany, N. Y.—The United Traction Company has received a franchise from the Council for a line from North Pearl Street in Sheridan Avenue to the site of the proposed new transformer station at Sheridan Avenue and Chapel Street in Albany.

Islip, N. Y.—The Public Service Commission has authorized the Suffolk Traction Company to exercise franchises to build four electric lines in Islip, Sayville and West Sayville.

Berlin, Ont.—The special committee of the City Council and the Light Commission has decided on what the city will request of the Galt, Preston & Hespeler Electric Railway before the new franchise for running rights over Berlin streets is granted. The present franchise expires in October. After that the city will grant a five-year franchise at $75 monthly for a half-hourly service during the afternoon for two years, and after that time half-hourly service all day. The city also wants running rights over the company's tracks in the east end for the local railway.

Toronto, Ont.—The Toronto Railway has asked the Council for a franchise for a line on Bloor Street west from Dundas Street to Pacific Avenue in Toronto.

***Corpus Christi, Tex.**—J. H. Caswell, Corpus Christi, has received a thirty-year franchise from the Council to build a 7-mile electric railway from Corpus Christi to Ward Island.

Olympia, Wash.—The Washington Public Service Commission will hold an important session in Seattle beginning with Sept. 30, to take up various matters as follows: Twenty-first Avenue service; arrangements of transfer exchanges between the Seattle Municipal lines, the Seattle, Renton & Southern Railway and the Puget Sound Traction, Light & Power Company.

Seattle, Wash.—The Puget Sound Traction, Light & Power Company has asked the City Council for the right to discontinue operating on Stewart Street, from Sixth Avenue to Eighth Avenue; on Eighth, from Stewart to Lenora, and on Seventh, from Olive to Stewart Street. The company does not operate a regular schedule on the above mentioned streets. Contracts for improving the streets with paving have been let by the city, and it is the company's desire to remove its rails. When an electric railway right-of-way is paved it is necessary for the company, under the terms of its franchise, to pay for the work.

Wenatchee, Wash.—Hyman Harris, who recently received a franchise for the construction of an electric railway in Chelan County, between Leavenworth and Malaga, has been granted an extension of one year's time before beginning operations, it having been explained to the County Commissioners that financial conditions were temporarily blocking the plans for carrying out the terms of the franchise. Authorities in touch with the project assert active operations will most likely start in the early spring. [E. R. J., March 14, '14.]

Madison, Wis.—The Chicago & Wisconsin Valley Railroad has asked for a certificate of necessity to build a line from Madison to Prairie du Sac.

TRACK AND ROADWAY

Lacombe & Blindman Valley Electric Railway, Lacombe, Alta.—Surveys have been made and all grade has been built and fenced culverts, etc., laid and plans are being made to lay ties soon on this 37-mile line to connect Lacombe, Bentley and Rimbey in the near future. The Middle West Construction Company, Lacombe, has the contract for the construction of the line. J. C. Gibson, 56 King Street, West, Toronto, president. [E. R. J., July 25, '14.]

Southwestern Traction Company, Lacombe, Alta.—Within the next sixty days work will be begun by this company on the 1-mile extension to Bentley Hill.

Salt River Valley Electric Railway, Phoenix, Ariz.—All matters in temporary dispute between the city manager and this company have been satisfactorily adjusted and active work is being pushed on the construction of the line east on Monroe Street in Phoenix. The first line will be built from Phoenix to Scottsdale and probably extended south across the Salt River to Tempe, Mesa and Chandler. It is the purpose of the company to build its own bridge across the Salt River. C. C. Lewis, Phoenix, president. [E. R. J., May 16, '14.]

British Columbia Electric Railway, Vancouver, B. C.—An agreement has been made between the Canadian Pacific Railway and the British Columbia Electric Railway whereby the latter company will construct an electric line on South Cambie Street as far south as King Edward Avenue and from there to Main Street and Oak Street to connect with existing lines. Work will begin early next spring, it is reported by officials of the company. British Columbia ratepayers of Ward 11 are agitating for the extension of the electric line on Bodwell Road from Fraser Avenue to Victoria Road. A petition has been signed asking the British Electric Railway to build this proposed line at once.

San Francisco, Cal.—Detailed surveys and drawings of the proposed municipal electric railway through Golden Gate Park in San Francisco have just been completed by City Engineer O'Shaughnessy. Owing to obstructions it will be impossible to extend the railway in a straight line and to make it conform to the general surroundings. The plan is to begin at Tenth Avenue on the northern side of the park and come out at Fourteenth Avenue on the southern side. Tenth Avenue is the present terminus of a branch of the Geary Street road and the proposed extension it is believed will add to the municipal line.

Pacific Electric Railway, Los Angeles, Cal.—Work will be begun at once by this company on its lines from Corona to Riverside. Construction will be begun at Riverside on the new Magnolia Avenue line to connect with the present line at the head of Magnolia Avenue. There remains 8 miles of track to be built from a point south of Arlington to Corona. It is estimated that this new line will be in operation by the end of November.

Connecticut Company, New Haven, Conn—This company is asked to consider plans to build an electric line through East Street from State Street to Water Street in New Haven.

Washington Railway & Electric Railway, Washington, D. C.—The Public Utilities Commission has formally ordered this company to extend its Anacostia line from the present terminus, at Nichols Avenue and Fourth Street, in Anacostia, to Upsal Street, a distance of less than a mile. The commission directs that the work be completed before June 30 next. Although the company opposed the improvement, it favors the plan now being considered by the commission for an extension of its lines to the new bureau of engraving and printing building. If this project is ordered the commission may authorize the company to issue bonds to the extent of $200,000, in order to meet the cost of both extensions.

Evansville, Chrisney & Eastern Railway, Evansville, Ind.—Surveys have been completed, part of the grading has been done, right-of-way secured and plans are being made to begin grading the remainder of the line within the next sixty days on this 24-mile electric line to connect Boonville, Lynnville, Chrisney, Bloomfield and other smaller towns. Capital stock, authorized, $50,000. Bonds, authorized, $400,000. The company will be ready within two weeks for bids on as many bonds as will be necessary to complete the line. The estimated cost is $300,000. J. P. Chrisney, Chrisney, president. [E. R. J., Sept. 12, '14.]

Terre Haute, Indianapolis & Eastern Company, Indianapolis, Ind.—Plans are being considered by this company to build its South Eighth Street line in Indianapolis during the fall.

Waterloo, Cedar Falls & Northern Railroad, Waterloo, Ia.—The 60-mile line between Waterloo and Cedar Rapids has been placed in operation by this company.

Erlanger, Ky.—Plans are being considered by the citizens of Erlanger to build an electric railway in Erlanger.

***Paducah, Ky.**—A company is being formed in Paducah to build an electric railway from Paducah to Henderson to connect with the lines of the Evansville, Henderson & Owensboro Railway. No names are yet given of those interested in the project.

North Louisiana Electric Railway, Shreveport, La.—Contracts have been awarded by this company to build a 97-mile interurban electric railway to connect Shreveport and Monroe via Haughton, Doyline, Sibley, Dubberly, Gibsland, Arcadia, Sinsboro, Ruston, Choudrant and West Monroe. A. B. Blevins, Shreveport, president. [E. R. J., July 18, '14.]

Bay State Street Railway, Boston, Mass.—Plans are being made by this company to double-track Main Street in the Bradford district for such a distance as will relieve all congestion on this end of the division.

Salisbury (Md.) Interurban Railway.—Preliminary arrangements are being made by this company to build its 40-mile electric railway from Nanticoke Point to Willards via

Bivalve, Tyaskin, Heron and Salisbury. W. H. Bedsworth is interested. [E. R. J., Aug. 29, '14.]

Mississippi Electric Railway, Columbus, Miss.—The citizens of West Point have consented to raise a bonus to secure the construction of this proposed electric railway through West Point. This line will connect Memphis, Tenn., and Columbus, Miss., and eventually extend through Pickens County, Ala., with Aliceville as the terminus. F. W. Crisby, Columbus, Miss., is interested. [E. R. J., Aug. 22, '14.]

***Fulton, Mo.**—Plans are being considered to build an electric railway between Keokuk, Ia., and Jefferson City, Mo., via Wayland, Williamtown, Labell, Newark, Bethel, Shelbyville, Shelbina, Paris, Mexico and Fulton. H. W. Knight, Chicago, is interested.

Middletown, Reading & Cincinnati Interurban Railway, Middletown, Ohio.—This company, which plans to build a 30-mile electric line between Middletown and Cincinnati, is having surveys made to have this line extend to Germantown and Dayton. Owing to unsettled financial conditions, it is not known when actual work on the railway will begin. Michael Klaiber, Jr., Reading, is interested. [E. R. J., Oct. 11, '13.]

***Dewey, Okla.**—Plans are being considered to build an electric railway from Dewey to extend northeast from Dewey to intersect with the network of electric lines in Kansas. Another line contemplated will extend along the high ridge from Dewey to Nowata. No names are yet given of those interested in the project.

Port William (Ont.) Electric Railway.—The contract has been awarded by the City Council of Fort William in connection with its electric railway extension to John Millen & Sons, Toronto, for the supply of poles, fittings and cast-iron ornamental lamp standards.

Peterborough (Ont.) Radial Railway.—Plans are being considered by this company to build an entirely new roadbed on Charlotte Street in Peterborough this fall.

Lehigh Valley Traction Company, Allentown, Pa.—Work has been begun by this company on Union Street to lay the track to connect the Sixth Street line with the line on Eighth Street, in Allentown.

***East Berlin, Pa.**—Plans are being considered to build an electric railway from East Berlin to New Oxford, to follow the line of Beaver Creek from East Berlin to Abbottstown, thence to New Oxford in a direct line. It is pointed out that very little grading will be required along the route of the proposed line. No names are yet given of those interested in the project.

Lewisburg, Milton & Watsontown Passenger Railway, Milton, Pa.—This company will extend its tracks at Watsontown from the present terminus at Ninth Street to the borough line.

Chattanooga Railway & Light Company, Chattanooga, Tenn.—The Vance Avenue line of this railway, work on which was begun early in the spring, is nearing completion. The track has been laid within a short distance of Lyerly Street, the terminus of the line in Chattanooga.

Castroville, Tex.—Citizens of Castroville have subscribed more than $20,000 as a bonus for an interurban railway through Castroville to the Medina dam. This is part of a plan to build an electric railway to connect Castroville, San Antonio and Medina Lake. John G. Fitzsimon, Castroville, is interested. [E. R. J., Sept. 2, '14.]

Dallas (Tex.) Consolidated Electric Railway.—Work has been begun by this company double tracking its line in Dallas.

Gulf, Freeport & Northern Railway, Freeport, Tex.—Surveys have been completed by this company into Rosenberg. This line will connect Freeport, Sealy, Brazoria and West Columbia. C. L. Sharp, Marshall, is interested. [E. R. J., Oct. 11, '13.]

San Antonio, San Jose & Medina Interurban Railway, San Antonio, Tex.—This company has 5 miles of its proposed line now in operation from San Antonio to San Jose, Tex. The remainder of the route is via Kirk, La Coste and Castroville to Medina Lake, a total distance of 42 miles from San Antonio. There will be two steel bridges, one of 100 feet over the Medina River near Kirk, and the other over Leon Creek. It is not yet announced when bids will be received for construction and equipment. The route is mostly level, but about 6 miles of it nearest the lake is through rough country. Connections with other lines are to be made as follows: International & Great Northern Railroad at Kirk; San Antonio, Uvalde & Gulf Railway at San Jose; Southern Pacific Railway at La Coste. J. G. Miller, 400 Swearingen Building, San Antonio, Tex., general manager. [E. R. J., July 18, '14.]

San Antonio (Tex.) Traction Company.—Work has been begun by this company laying new track on Commerce Street and Alamo Street in San Antonio.

***St. George, Utah.**—Surveys are reported to have been begun for an electric railway from Lund to St. George. A. B. Christensen, Salt Lake City, is interested.

***West Virginia Electrical Company, Parkersburg, W. Va.**—This company will soon apply for a charter to build an electric railway from Weston to the terminus of the Little Kanawha Railway. The plans are to use the tracks of the Little Kanawha Railway into Parkersburg. Plans are also being considered for the purpose of making agreement with the Charleston, Parkersburg & Northern Railway by which the West Virginia Electrical Company would use the lines of that company coming around Fort Boreman and into Parkersburg over the Juliana Street bridge. Some further developments in the plans are expected in a few days. No names are yet given of those interested in the project.

SHOPS AND BUILDINGS

Illinois Traction System, Peoria, Ill.—The steel skeleton of the new station and office building of this company is being erected at the corner of Jefferson Avenue and Hamilton Boulevard in Peoria. The foundation was completed some time ago and the contractors have been waiting for the delivery of the steel. The structure will now be pushed forward to completion as rapidly as possible. The building will be seven stories in height and will cost $300,000.

Centerville Light & Traction Company, Centerville, Ia.—A few changes and improvements are being made in this company's offices in Centerville.

New York, N. Y.—The Public Service Commission has authorized the advertising for bids for the diagonal station, at Park Avenue and Forty-second Street, in New York, to connect the existing subway with the new Lexington Avenue line. The bids will be opened Oct. 6. Besides the connection with the Lexington Avenue subway there will also be a connection with the Steinway Tunnel. Most of the excavation will be in solid rock and the work will have to be done without interrupting the service in the existing subway.

POWER HOUSES AND SUBSTATIONS

Water, Light & Transit Company, Carrollton, Mo.—During the next few weeks this company plans to purchase one 300-hp water tube boiler for its power house in Carrollton.

Metropolitan Street Railway, Kansas City, Mo.—This company is arranging foundations and other accessories, condensers, etc., at the Second and Grand Street Station in Kansas City for the 12,000-kw turbine which is to be installed next month.

Hershey (Pa.) Transit Company.—This company's power house near Lebanon is rapidly nearing completion and the company will soon install the new generators and necessary machinery to operate the line between Lebanon and Hummelstown. The power plant is built of cut stone and is along the Hershey right-of-way about 3 miles southwest of Lebanon.

Norfolk & Western Railway, Bluestone, W. Va.—Construction is well advanced upon this company's power plant at Bluestone, W. Va., which will furnish current for the electric operation of 30 miles of railroad between Bluefield and Vivian, and it is expected that the entire section will be ready for use by January. Work on the building proper is about 95 per cent completed, and considerable of the mechanical and electrical equipment has been received and partly erected. Gibbs & Hill, Pennsylvania Station, New York, are the engineers in charge.

Manufactures and Supplies

ROLLING STOCK

Fort Wayne & Northern Indiana Traction Company, Fort Wayne, Ind., has assured the City Council that ten new cars will be added each year to those now in service until all old type cars are replaced.

TRADE NOTES

Indianapolis Switch & Frog Company, Springfield, Ohio, has appointed A. H. Hoffman, president of the Wimo Supply Company, as its Northwestern representative with office at 304 Oriental Building, Seattle, Wash.

Graphite Lubricating Company, Bound Brook, N. J., announces the following reappointments of officers caused by the recent death of Charles H. Libbey, president of the company: William W. Smalley, president and treasurer; Leigh S. Bache, first vice-president and general manager; Spencer Weart, second vice-president and secretary; George O. Smalley, assistant treasurer and assistant manager.

U. S. Metal & Manufacturing Company, New York, N. Y., has been appointed resident purchasing agent in America for the Underground Electric Railways, Ltd., London, Eng., and its allied lines, the London General Omnibus Company, Ltd., Metropolitan District Railway, London Electric Railway, Central London Railway, and City & South London Railway. Conditions abroad, involving the shutting down of Continental foundries in the war zone have necessitated obtaining various iron and steel electrical and mechanical materials in this country.

Gun-crete Company, Chicago, Ill., the announcement of whose organization appeared in the ELECTRIC RAILWAY JOURNAL on May 23, 1914, has purchased all the rights, titles, contracts and interests of the Cement-Gun Construction Company, and has also taken over the construction department of the General Cement-Gun Company. In future the combined business will be conducted under the firm name of Cement-Gun Construction Company, with offices at 914 South Michigan Avenue. The officers of the company are: President, Carl Webber; secretary and treasurer, John D. Schaefer; construction manager, C. L. Dewey. In addition to doing all forms of cement-gun construction work, this company will also sell and lease complete cement-gun equipments.

Niles-Bement-Pond Company, New York, N. Y., has recently completed at the Brooklyn Navy Yard the installation of the largest boring mill ever built in this country. This mill was made at the Niles works, Hamilton, Ohio. It swings 36 ft. in diameter and has 12 ft. under tools. The great swing of this machine is required for finishing the tracks of the immense turrets carrying the 14 and 16-in. guns of the new battleships. The mill will also be used for boring cylinders and machining casings of the giant steam turbines for our war vessels. The significant feature about the size of this mill is that it is not of the so-called "extension" type, but it is a regular cross-rail machine with an actual swing of 36 ft. 2 in. with the housings in a fixed position. An idea of the size and massiveness can be gained from the fact that the total net weight, including motors, is 665,000 lb., or more than 330 tons. The table is designed to carry a weight of more than 200,000 lb. The extreme size of the table, 34 ft. diameter, made it necessary to be cast in three parts. The three sections of table weighed 225,000 lb.

Prepayment Car Sales Company, New York, N. Y., announces that since July 1 it has booked the following orders for material for new cars or old ones to be changed or converted for prepayment service: Auburn & Syracuse Electric Railroad, twelve cars; Boston (Mass.) Elevated Railway, forty-three cars; Buffalo & Williamsville Electric Railroad, two cars; City Railway, Dayton, Ohio, one car; Cleveland (Ohio) Railway, 100 cars; Cumberland Electric Railway, ten cars; Dayton, Springfield & Xenia Southern Railway, three cars; Easton (Pa.) Transit Company, nine cars; Fort Smith Light & Traction Company, three cars; Harrisburg (Pa.) Railways, fifteen cars; Holyoke Street Railway, one car; Hutchinson (Kans.) Interurban Railway, one car; New Orleans (La.) Railway & Light Company, fifty cars; Northern Ohio Traction & Light Company, eight cars; Parkersburg, Marietta & Interurban Railway, two cars; San Antonio (Tex.) Traction Company, eleven cars; Second Avenue Railroad, ten cars; Sheboygan Railway & Electric Company, two cars; Springfield (Mass.) Street Railway, ten cars; Springfield (Ohio) Railway, ten cars; Third Avenue Railway, twenty-five cars; Toledo Railways & Light Company, ten cars; Trenton & Mercer County Traction Corporation, thirty-cars; Worcester (Mass.) Consolidated Street Railway, ten cars.

ADVERTISING LITERATURE

National Tube Company, Pittsburgh, Pa., has issued an advertising blotter in regard to its "National" pipe.

Vulcanite Portland Cement Company, Philadelphia, Pa., has issued a reprint of a paper from the 1914 Proceedings of the American Society for Testing Materials, entitled "Proportioning Aggregates for Portland Cement Concrete," by Albert Moyer.

Union Electric Company, Pittsburgh, Pa., has issued a folder describing its sand drying stove for trolley lines. The main body of the drier is surrounded by upright cast-iron grating to prevent the wet sand from coming into immediate contact with the hot furnace. As soon as the sand is dry it runs through this grating into the hot-air space and then out through the perforated ring on which the skirting rests. This permits the wet sand to dry much more rapidly than when it comes into immediate contact with the hot stove.

Ohmer Fare Register Company, Dayton, Ohio, has issued a folder describing its totalizing register for street railway service. This register prints the hour and the minute each half trip is begun, date, register number, division or line number, direction and the number of fares registered in each class. No deduction between imprints are necessary. The total amount of cash collected is also printed on the sheet so that no multiplications are needed to arrive at the total. At the completion of each conductor's run all printing counters are turned back to zero with the exception of the total passenger counter. This provides a check between records of successive conductors and between the closing figures of one day and the opening figures of the next.

American Lock Nut Company, Chicago, Ill., has issued a catalog describing its absolute lock-nuts for electric railway crossings, frogs, switches, insulated joints, signal devices, interlocking systems, rails, cars, shop machinery and motors. A recess is cut into the thread surface of the nut, through its width. The floor of this recess is slightly sloped. A spool-like locking pin is inserted automatically in the recess and this pin rolls with the bolt. When the nut is being applied the pin rests in the deeper part of the recess and rolls with the bolt. It immediately wedges itself, however, between the sloping floor of the recess and the threaded faces of the bolt, resisting any backward motion. The greater the force tending to back the nut off the bolt the tighter it locks. The pin cannot injure the threads since the pressure is against their flat surfaces. The catalog contains illustrations showing nuts covered with rust accumulation after two years' service on an electric car, which were easily removed. On cars these nuts are especially suited for motor brackets, split gears, brake beams and trucks.

Protective Signal Manufacturing Company, Denver, Col., has issued through William K. Garton, general sales manager and associate engineer, 299 Broadway, New York, a catalog containing illustrations and detailed description of its protective signal system and signal devices for electric and steam railroads. In this signal system an oscillator acts on the button principle in opening or closing an electric circuit. The movement of the passing train or car imparts a vibration to the rail, and when the train moves over the point where the oscillator is placed starts the vibrating bob of the oscillator moving up and down and breaks the contact between the contact bob and upper contact spring, opening the line circuit to the relay, which in turn closes the local or signal circuit and operates the signal. This signal system has been used successfully for highway crossing signals, annunciators, time relays, interlocking relays, tower and station calls, car counters, tunnel signals and light signals. The catalog contains illustrations showing instalments of this system of crossing protection on the Petaluma & Santa Rosa Railway and on a number of steam lines.

Electric Railway Journal

Consolidation of Street Railway Journal and Electric Railway Review

Vol. XLIV NEW YORK, SATURDAY, OCTOBER 3, 1914 No. 14

DEATH OF CAPTAIN McCULLOCH

In the death of Captain McCulloch the electric railway industry loses one of its most prominent figures, and the event will be felt as a personal bereavement by many, especially by those who have long been engaged in the industry. Captain McCulloch's career was unique and is convincing testimony of his great ability and strong personality. It is rare in these days for any railway manager to be connected with the same railway property for a period of two decades. But in the case of Captain McCulloch and the St. Louis railway system, the connection extended for practically twice that length of time with the exception of a short period during 1901 and 1904 when he was general manager of the Chicago City Railway. He knew and loved the city where his life's work was laid, and St. Louis knew, loved and trusted him—an ideal condition. If this was the general case there would be no such problem of public relations before the electric railways of this country. But Captain McCulloch's activities and sympathies were not confined to any one city. No one felt a keener concern for the progress of the art or was more generous of his time and energy in helping brother managers when they came to him for advice, or was more loyal to the call of duty. Powerful in physique and intellectual power, yet possessing in a marked degree the characteristic Southern qualities of courtesy, chivalry and devotion to ideals, Captain McCulloch has left a memory which will long remain in the hearts of those who enjoyed the privilege of acquaintanceship and friendship with him.

WAR'S EFFECT ON FIRE INSURANCE

Another instance of the far-reaching effect of the European war upon every phase of our every-day life has recently been called to our attention. Fire insurance companies are endeavoring to impress upon the public the importance of special care in the matter of fire prevention at this particular time. They advise that normal losses have been heavy during the present year, and if a serious conflagration should occur now, it, in combination with the existing financial and banking conditions, would produce a most serious result. It would be necessary for the insurance companies to sell large amounts of their securities to pay a loss of great magnitude, and with the stock exchanges closed this would be practically impossible no matter how great sacrifices they might be willing to make in order to meet their obligations promptly. Such a sacrifice, with its destruction of values and its disturbance of financial conditions, would be very serious indeed. As a result of circulars and other information which is being sent out by the various fire insurance companies throughout the country many large industrial and mercantile companies have taken rigid measures to prevent fire. Most electric roads have already reduced their fire hazards by the installation of various types of fire-protective systems. Carhouses and shops, however, are looked upon as being more or less of a special hazard. Bulletins issued by the managers of railway companies at this time, calling attention to the urgent need of fire prevention which not only means loss of property but loss of income to the company and the employees as well, should be productive of good results in the reduction of fire hazard.

PROVOKING DISCUSSION AT ATLANTIC CITY

We do not wish to be accused of reiterating the obvious, but we shall run the risk of doing so by making the following remarks in regard to the advance copies of the Atlantic City papers and committee reports which have recently come to hand. Only those who have been actively engaged in getting out such preprints can realize the amount of steady effort which has been required on the part of Secretary Burritt and his associates during the past few weeks. We have already called attention to the benefit to be obtained by advance study of these pamphlets. A concrete suggestion which, if acted on, would insure lively discussion is that each man come to the convention armed with some practical question suggested by each report in which he is interested and which is not answered in the report or in previous reports on the same subject. The old adage that "any fool can ask questions" is a fallacy if any but "fool questions" were meant. A well-placed question is one of the best contributions that can be made to any discussion. It involves an all-around knowledge of the subject. If we had to choose between a good question or a good definite contribution of data we should take the question. To paraphrase a well-known proverb—"Take care of the questions, and the answers will take care of themselves." We hazard the guess that fifty men can be found to answer a question to five who will ask one. There is a natural and just prejudice against "cut-and-dried" discussion, all nicely fixed up in advance and necessarily prepared in ignorance of the spirit of the meeting and possibly, therefore, out of harmony with the trend of the discussion. No such prejudice can exist in regard to the question scheme suggested above.

THE PROPOSED INCREASE IN A. E. R. A. DUES

There will go before the American Electric Railway Association at the Atlantic City meeting a plan for increasing the dues of the company members. This was considered at the midwinter meeting and has been placed before the members recently in a circular letter. The tremendous expansion of the association's work has made the increase necessary. The decision to lay this matter before the association was reached before the present critical financial depression so that a question will naturally arise as to the wisdom of bringing it to vote until after the effects of the war have begun to wear off. If the amount of money concerned in the increase were large in proportion to the interests involved, this question would deserve consideration. The reverse, however, is the case. A light snowfall, a rainy day for the baseball game, a slight car collision, a minor accident to a passenger, or some such trivial incident will cut down the income more than the increase in dues and will be charged to profit and loss, to providence, or human frailty. It is evident then that a decision as to the increase in dues must be reached on a qualitative rather than a quantitative basis.

Qualitatively the following points must be considered. When the present scale of dues was adopted it was necessarily tentative. No one man or body of men could estimate accurately what it would cost to run the association ten years later. No one could anticipate that an office staff of sixteen members would be required; that the association would be publishing a monthly magazine, maintaining a fare research bureau, keeping a representative at Washington, etc., beside financing committee work involving the co-operation of more than 400 members. It might be argued that the income can be increased by getting in more members. The fact is, however, that most of the important companies are now in the membership, and while the others should be induced to join at once they will not greatly augment the income. The individual membership can and should be increased also, but again, with the nominal fee required of individuals, no great income can be expected from this source. If a further argument is advanced to the effect that retrenchment is in order it can be answered with equal ease. The industry and the economic problems confronting it have forced certain work on the association. This work must be done. Failure to supply the necessary means would be like sending an army into the field and then refusing it the necessary support.

The association is doing a great work and it is a vital part of the electric railway industry, a necessary adjunct to the individual railway. Its facilities are utilized to an increasing extent, particularly by the small company. The increase is urged to care for existing activities not to permit a branching out into new fields. The executive committee of the association has the confidence of the industry. It spends none of the money entrusted to its care without most careful consideration. If it says more money is required there is but one thing to do.

TIMBER PRESERVATION AND THE EUROPEAN WAR

The necessity of taking immediate steps to conserve the supply of timber preservatives in this country, as well as to seek other sources of supply, is impressing the American users of timber more and more as the European war continues. At first the interruption of 50 to 70 per cent of our supply of creosote was looked upon as temporary, but now a month and a half has passed with new evidence each day that the countries at war have engaged in what will probably be a prolonged conflict. While many American enterprises were retarded by the early depressing effect of the war, they now have begun to adjust themselves to existing conditions. Though the amount of new railway construction undertaken in this country affects to some extent the quantity of treated timber used, that employed by both steam and electric railroads here is largely for renewals. For this reason, there must continue to be a large demand each year for treated timber if the roads expect to continue economical operation. This means that it will be necessary for them to use either untreated timber, a substitute preservative, or reduce the quantity of creosote now required in practically every creosote treatment specification.

Of course the substitution of the zinc chloride treatment for the creosote is possible on electric roads, but it is not advisable. Past experience has shown that the combination of moisture, zinc-treated timber and the electric current results in the rapid electrolytic corrosion of the spikes and the rail base, and this has favored the use of creosote or some other substitute for zinc chloride in electric railway work. Treatment by the empty cell as against the full cell process seems to offer an immediate means of conserving the supply of creosote. Experience has demonstrated that the maximum life has been obtained by both processes, hence the empty-cell treatment furnishes a means of reducing the quantity of this preservative used from 25 to 50 per cent.

Another means of conserving the amount of creosote used is by its adulteration with a refined coal tar. This tends to reduce the evaporation of creosote from the timber so treated without detrimental effect. Since the creosote originally is a distillate of coal tar, the claim seems reasonable that the coal tar is a weak preservative containing toxic properties. While the ideal of the wood preservation engineer has been to have a stick of timber thoroughly saturated with a grade 1 creosote, a continued interruption in the supply will force the industry to accept something other than the ideal.

Experience also has shown that it is unnecessary to use as much creosote as is at present considered good practice to produce a condition in which decay is prevented. The difficulty in the past, however, has been to maintain this condition in the timber throughout its mechanical life. If one can believe the arguments presented by experts, it appears that the use of refined tar prevents evaporation, hence the conclusion may be drawn that a smaller quantity of creosote may be used and at the same time accomplish the desired result.

REVIVAL OF THE FLAGGING RULE

Elsewhere in this issue is a communication from F. A. Boutelle in support of the erstwhile rule permitting trains to proceed "protected by flag." As Mr. Boutelle, himself, was a member of the 1911 committee which abolished the old rule on the ground that it "was not good practice" it begins to be apparent that the whole question is in very much of a tangle. That this should be unravelled at the earliest possible moment is hardly open to argument. Certainly, it is no logical condition that results in a number of member companies including in their codes a rule which has received the stamp of disapproval of the association.

Manifestly, the elimination of the flagging rule has worked a hardship upon operation. However, that this hardship was more than counterbalanced by a greater degree of safety was evidently the opinion of the committee on rules in 1911, although it is true, as John Leisenring pointed out in our issue of Sept. 12, that conditions have changed since that time through the more general use of signals. Whether or not these changed conditions warrant the revival of the flagging rule seems, in effect, to be the point upon which opinion splits. Mr. Boutelle is in favor of it, and he is supported by Mr. Leisenring. On the other side of the question we have published the directly contrary views of three members of the 1913 committee on rules. We, ourselves, are strongly against the revival of any such necessarily indefinite rule, which depends for its degree of observance upon the discretion of the trainmen, and which is certain to be as carelessly followed as the present rear-end-protection rule. As we have said before, a general permission to proceed past a stop signal is dangerous, and it is unnecessary, as well, when safety can be assured by the comparatively small loss of time involved by holding the car until one of the crew goes forward with torpedoes to the next signal, siding or telephone, and returns.

There may, however, be other methods of proceedure preferable to this, and perhaps the most satisfactory solution of the whole problem would be the preparation by the association of a new rule which would eliminate the obviously weak features of the old one without opening the way for an exaggerated interpretation of the present code, or rather of the present absence of specific instructions. It is, of course, futile to expect a train to wait indefinitely at a deranged signal, thereby holding up traffic over the entire road. On the other hand, it is infinitely more undesirable for roads to have, within their codes of rules, a printed permission for trainmen to do something which has been condemned by a body of highest authority.

If, as is indicated by Mr. Boutelle's communication, the complete elimination of all provision for the irregular movement of trains under extraordinary circumstances was not intended by the 1911 committee, by all means let some suitable procedure for trainmen, who may be unable to reach the dispatcher, be incorporated in the standard code. Should this be considered the best way out of the present *impasse* the association can hardly take up any more urgent work, for by it those interurban roads which have adopted the flagging rule—despite its condemnation—may be relieved from their present anomalous position. If the matter cannot be considered at the coming convention, the drafting of a compromise rule might well be assigned to next year's committee on rules.

A NEW SCHEME FOR ACCELERATING TRAFFIC

It is by no means uncommon to hear statements made in all seriousness that installations of block signals on single tracks result in speeding-up the service. Details as to how and where this beautiful dream is made a reality are invariably lacking—probably with good reason—because, under the operating methods now customary, it is difficult, to the point of impossibility, to see wherein the ability of the block signal is utilized to accelerate high-speed traffic. As a matter of fact, in most cases the signal seems to have less of an accelerating than a retarding effect. Indeed, it has been so surrounded by and subordinated to the old standard scheme of operation and the use of train orders that the statement that block signals comprise merely a safeguard superimposed upon the structure of operating rules is quite in line with actual conditions.

Such conservative operation may be necessary. But, on the other hand, no actual evidence to this effect has ever been produced, and, until very recently, there has been no one yet prepared to let the high-speed signal, with all its refinements, really show what it could do. For some time past, however, the Scranton & Binghamton Railroad has been doing just this. This line is using its block-signal system, not merely as a safeguard, but as a traffic accelerator as well, and a description of the methods introduced to attain this end will be found elsewhere in this issue.

Briefly stated, these methods are simple. They are based upon the acceptance of signal indications at their face value. When a train finds a proceed signal it proceeds, practically regardless of time-card meets and absolutely independent of train orders, for none of these are issued except in the most extraordinary emergencies. When a stop signal is encountered the train waits, because another train in the opposite direction will soon arrive. This, in a nutshell, covers the scheme of operation, which permits the running of multiple-unit trains, sometimes with sections, on a fifteen-minute headway in both directions. This rapidity of movement, according to the railway management, would be impossible if time was taken for the delivery and receipt of train orders.

Naturally, consideration of this radical innovation brings up, at once, the influence of a delayed train on the schedule as a whole, and under comparison with the train-order system the advantage seems to lie altogether with the new plan. On the line in question each block averages about 1 mile in length and requires somewhat less than three minutes for a train to run through it. Hence a train that is just too late to hold the block will have the meeting point advanced against it and will be delayed some three minutes in addition to its original delay. On the other hand, if the delayed train is six minutes late it will arrive at the advanced meeting point just in time to meet the opposing train and hence will lose no further time. In neither case is there any delay to the train that is on time. Under the train-order or time-card systems of operation not only would there be delay to the train that was on time, but, unless the lost time was made up at once, or a new set of meet orders issued, every other train on the road would eventually suffer the same delay. For a train that is considerably delayed the matter of further loss of time depends simply upon whether the actual delay is just over or just under a multiple of the time required to run through a block, in this case about three minutes. Under no ordinary circumstances can the added delay be greater than three minutes, and under none can there be more delay than this for opposing trains.

Certainly such a time-saver as this innovation ought to be considered very seriously. While it has been forced, by a dense traffic, upon the Scranton & Binghamton Railroad its benefits seem to be equally available for interurban roads in general, although, of necessity, its ability to save time is limited in the case of extremely long blocks. Of course, there may be objections to it that are not now readily apparent. On the other hand, the fact that it is actually in successful operation as a logical advance step in the use of block signals is a strong point in its favor. Indeed, since signals are already in place on many railways a very natural question arises as to whether or not these are really being utilized to their full value under the customary operating methods. We would welcome a general discussion upon this point.

TRUSS RODS FOR STEEL CARS—A PARADOX

A supporting device which assists a wooden structure to carry its load but which has the contrary effect on a structure that is made of steel may seem to be an impossibility. If so, the truss rod constitutes an interesting paradox. When it is installed on an all-steel car that is, presumably, constructed in accordance with the well-established principles of the truss-side or, at least, the side-girder type of construction, its effect may actually be harmful, although the reverse is true in the case of wooden cars. The apparent paradox is, of course, due to the different principles of design that apply to the two materials, and, when these are analyzed there is furnished an obvious reason why the truss rod has no place whatsoever in steel car construction.

Inherently, the truss rod can only support a load through the establishment of a tensile stress in the rod. This stress is from six to eight times as great as the lifting effect because of the limited depth of the queen post in comparison to the distance between the post and the truss-rod anchor, and the consequent flatness of the angle at which the pull of the rod is transformed to vertical thrust at the queen post. Therefore the presence of only a small load upon the posts requires a large tensile stress in the rod, and this, in turn, must be offset by an equivalent compressive stress in the side girder to which the truss rod is anchored. This force divides between the top and bottom members of the girder, of which one is under additional compression on account of the bending moment that exists except at the instant of reversal. The two forces, when added, combine to form the total force producing stress in the member. In consequence, as the truss rod is tightened up the net result may be, under easily conceivable circumstances, that the maximum stress is greater than it would be if the truss rod was not applied.

Historically the truss rod is a makeshift in car construction. It was introduced in the days when the sills of all-wood steam-railroad cars became too long between truck centers to carry their own weight. An increase in the depth of the sill to provide the necessary stiffness was prevented by the practically fixed distance between the wheels and the car floor, and, as we have remarked before, the then prevalent idea of car design was to build a house on a flat car. The truss rod furnished an equivalent of the desired additional depth of sill by changing the underframe members from beams to the compression members of trusses. In consequence, the truss rod came into general use, although to be effective, as above mentioned, it had to impose a normal compressive force in the sill several times as great as its supporting effort. With wooden cars, however, this compression was easily absorbed owing to the large cross-section of the sills.

When steel was not available the idea was excellent. The turn-buckles with which the truss rods were equipped furnished a flexibility eminently suited to the rough-and-ready methods of wooden car construction. By setting up the turn-buckles the sills could be straightened up when they sagged from age or use, and some master car builders even advocated a strong camber or upward bulge at the center of the car when it left the shop. The advantages of a tension member of metal that could be located to give the equivalent of a beam of very considerable depth were obvious, and the truss rod was used so often that it probably became identified as an essential part in the appearance of the car.

Perhaps this feature may seem to some a point in favor of truss rods on steel cars. Unfortunately, the "looks" of a thing play a large part in design—witness the general use in an open car of glass deck-lights, which are even less useful than the proverbial fifth wheel on a wagon. Certainly there seems to be no better reason for advisedly installing truss rods underneath the side of a newly-built steel car, which, in itself, constitutes a steel beam or truss of such great depth that but a small part of its inherent vertical strength can be utilized. On the other hand, the turnbuckles on the truss rods impose an actual element of danger, as a car repairer, by setting them up strongly with the mistaken idea that a camber can be put into an all-steel car side, may develop abnormal strains sufficient to buckle plates or start rivets.

In the light of this possibility it is difficult to see wherein the use of truss rods is warranted even in the case where additions to the estimated load on an all-steel car have been made after it has been completed. When such a contingency arises, and when the additional load amounts to more than the 15 per cent or 20 per cent of the total car-body weight which can properly be taken care of by the factor of safety, the logical course would seem to be to rivet additional metal to the outer members of the girder. Such a procedure would be directly productive of results and would not involve, as might the truss rod, the paradox of adding metal that weakens the structure instead of strengthening it.

BRITISH TRAMWAYS AND SUPPLY HOUSES IN WAR TIME

Not a little curiosity has been expressed among American electric railway operators and manufacturers as to the effect of the present European conflict upon British and Continental tramways and supply houses. As yet, however, owing to the activities of the censors, the delays to which the mails have been subjected, the partial suspension of the cable service and the abandonment of the editorial pen for the sword, communications from the warring nations have been scarce. In fact, reports concerning electric tramways in Germany, France, Belgium, Austria and Russia are almost entirely missing, and only this week has any real information concerning British tramway conditions become available. Whether the electric railway situation in Great Britain, as described elsewhere in this issue, is better or worse than that in the other belligerent states must as yet be a matter of individual opinion, but the effects of the war on British tramway operation and receipts may at least be taken as a working basis for forming judgments concerning the conditions elsewhere.

The available evidence tends to show that the declaration of war in Great Britain resulted in a temporary feeling of panic in industrial and transportation circles, but that matters are now tending toward the resumption of a more normal state. As regards the tramways, the chief drain has been the decrease in the number of employees on account of the reservists and territorials being called into service. Up to Aug. 31, 1682 motormen, 2174 conductors and 2101 other employees, representing practically every undertaking, had joined the colors. The way in which the public corporations and the private companies co-operated in mobilizing the troops is well illustrated in the case of the Glasgow Corporation Tramways, which has been devoting its utmost energy to the formation of an entire battalion of 1100 men from among its own employees. The tramway systems have all protected their reservists and territorials and also encouraged volunteers to enlist, through promising monetary assistance to dependents and also a certain resumption of civil occupation without delay upon the return from the war. To be sure, this corporate patriotism has not been without its restricting effect on tramway service, but through rearrangements of the staffs, the elimination of holidays and a general advancement of all employees, the necessary steps have been taken to insure the efficiency of the service.

The full effect of the war on tramway receipts is as yet undeterminable, although it is certain that the revenues of tramways have been less affected than those of many other industries. In some instances, as in Manchester and Salford, definite figures of losses are available, but in general no startling decreases are reported. In a few cases there have been reductions in service, but as much on account of the absence of efficient operating men as on account of a desire to curtail operating expenses. The fact that the cost of coal and tramway supplies in general has not risen appreciably is a fortunate factor. As a rule, employers of all classes are looking at the situation more sanely, and it is likely that both tramway employment and revenues will now begin to make up the slight losses they have experienced.

It would rather be expected that tramway extensions and new construction would be at least temporarily postponed and that only the maintenance work necessary to the continuation of operating efficiency would be undertaken. Some lines having improvements under consideration may not take decisive action until the final effects of the war are better known, but in view of the optimistic outlook regarding revenues and expenses, most companies are likely to pursue their customary path of development. Another reason for this may be found in the attitude that the corporations and private companies have assumed toward the question of unemployment. Wherever there seems to be a prospect of many men being turned out of work, tramway authorities have expressed a willingness to undertake pending renewals and new construction in order to provide as much work as possible. This movement is only another outcropping of the general "business going on as usual" spirit that seems to pervade the entire British traction field.

The brightest exhibition of optimism is on the part of the British electric railway manufacturers, who, according to the *Tramway and Railway World*, are unanimous in declaring that the industry is unaffected by Continental conditions and that domestic and overseas buyers can be promptly supplied by British firms. Items of information are sifting through regarding the cancellation of contracts made by British companies with German firms in favor of British manufacturers. The British boards of trade are endeavoring to supply information and advice concerning openings for tramway materials, and it is stated that British banks are recovering from their period of reluctance in regard to furnishing capital for the extension of the trade. It does not require a very close examination of British reports to discern strong signs that the British, full of confidence in the maintenance of their naval supremacy, are looking toward a vigorous competition with American manufacturers for the great world electrical trade that now seems available.

A New Method of Traffic Acceleration on the Scranton & Binghamton

This Interurban Line, Which Maintains During the Rush Hours a Service of Multiple-Unit Trains Under Fifteen-Minute Headway in Both Directions on a Single Track, Depends Largely Upon Its Signal System to Keep This Extremely Heavy Traffic in Motion, and a Description of the Operating Methods Is Given

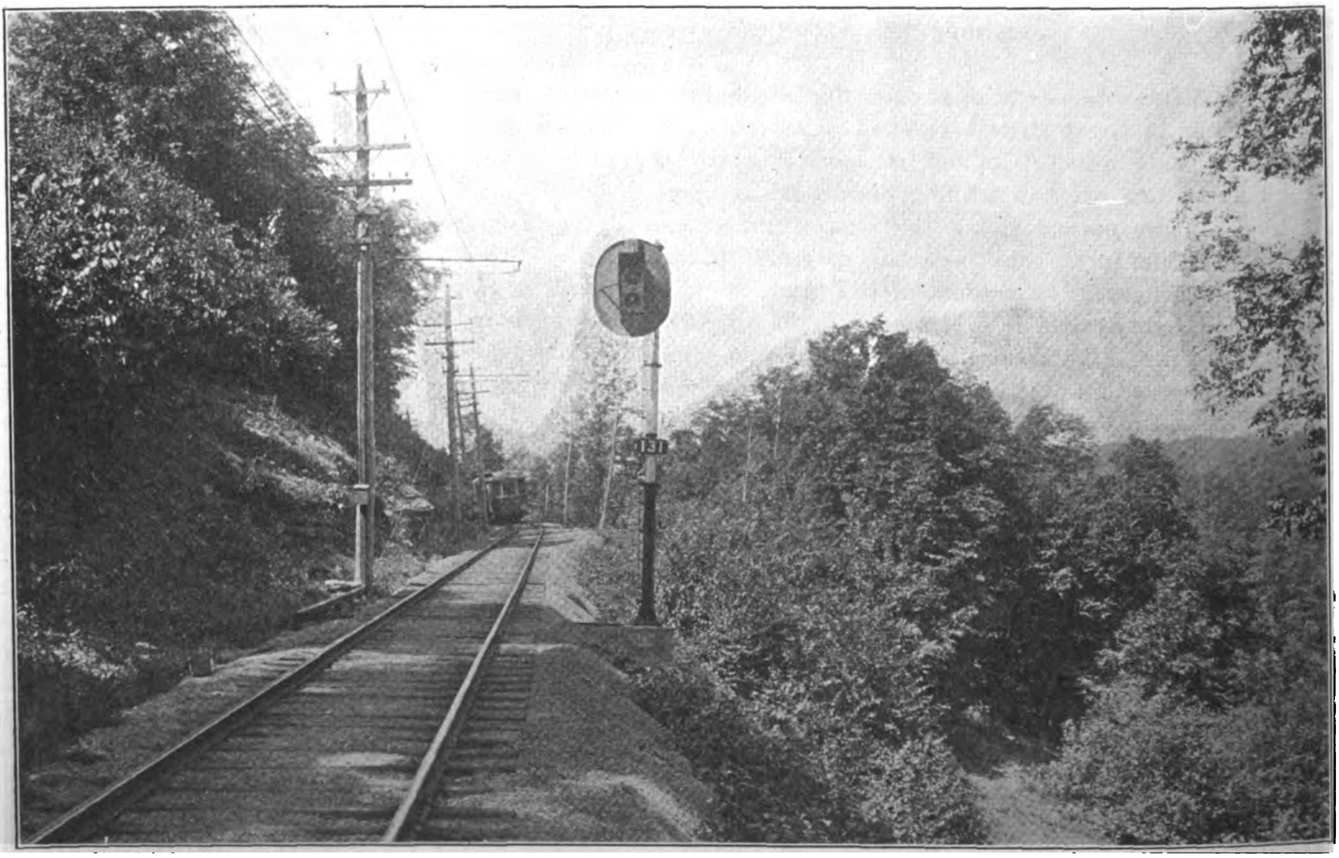
The Scranton & Binghamton Railroad, an interurban line which is being constructed to connect the two cities from which it takes its name, has at the present time, 26 miles of track in operation between Scranton, Pa., and several prosperous farming centers in the northern foothills of the Allegheny Mountains, among which the one best known to fame is Factoryville, the birthplace of the immortal Christy Mathewson. As fast as each section of the line has been completed it has produced a traffic of considerable volume until, at the present time, the service at the Scranton end of the line during the daily four-hour rush and for eighteen hours on holidays requires the operation of multiple-unit trains at fifteen-minute intervals in both directions. The average schedule speed is 19 m.p.h. with 2.2 stops per mile. The maximum running speed approximates 45 m.p.h.

As the right of way extends in several places along the banks of mountain streams and upon steep hillsides, the cost of double-tracking would be very great, and in order to handle a service of such extreme frequency on a single track a number of radical operating methods have been introduced. Foremost among them is the complete elimination of train orders. Trains are operated according to time-card under normal conditions, but, when these do not obtain, complete dependence is placed upon the train crews under the guidance of an automatic signal system of the Union Switch & Signal Company's "T.D.B." type, to get the cars over the road with safety and dispatch.

OPERATING METHODS

Extras are run whenever necessary and a number of milk and express cars are sandwiched in as second-class trains. The latter have places upon the time-card and the crews are trained to do such rapid handling of shipments that the time is practically that of first-class trains but they, of course, have no rights over the passenger service, and, like the extras, they are obliged to work their own way over the road by the signals if they drop behind their places on the schedule. Judged by the methods now in vogue on interurban lines throughout the country, such conditions as these might be considered to demand the presence of a dispatcher, but it is the expectation of the management that this may not be the case, even when the complete line to Binghamton is in operation.

The basic principle which permits this radical innovation is the acceptance of signal indications at their face value. The time-card serves as a means for preventing delays of first-class trains by those with inferior rights



SCRANTON & BINGHAMTON TRAFFIC—TYPICAL VIEW ALONG LINE, SHOWING DIFFICULTIES OF DOUBLE-TRACKING—LIGHT SIGNAL IS SHOWN IN THE FOREGROUND but its importance extends but little beyond that. South-bound first-class trains have directional rights over other first-class trains, and if a south-bound train reaches a scheduled meeting point and finds a clear signal for the block in advance it proceeds at once, holding the opposing train and making the meet at the siding in advance. In case a north-bound train makes a scheduled meeting point and finds a clear signal it waits for two minutes past the meeting time and then, if the signal has not in the meantime moved to stop position, indicating that the opposing train has entered the block in advance, it is entitled to proceed. In other words, first-class trains are privileged to advance meeting points against opposing trains whenever the latter are late.

Milk and express trains are not entitled to advance meeting points against first-class trains but must await their arrival at scheduled meeting points, and in case they drop behind to the time of following first-class trains, they must let these trains pass them. Work and other extra trains have no rights of any kind and must dodge over the line as best they can. They are not, however, required to clear the time of scheduled trains with the customary three or five-minute margin.

Extra first-class trains, when necessary, are given full time-card rights by posting bulletins to that effect two or three days in advance. Notice regarding work trains and track gangs are also given by bulletin in the usual manner, but extras may be run out at any time without notification. Indeed, on days of heavy travel, an extra car and crew is kept ready at Dalton, the middle point of the line, to take the place of any train that drops badly behind its schedule. The extra takes the time and rights of the delayed train and the latter completes its run from Dalton to the end of the line as an extra and is taken off when it gets back to Dalton.

The time-saving influence of this scheme and its steadying effect on the schedule are obvious. However, in case train orders and notifications for other trains had to be issued before the extra could be sent out it is also obvious that a considerable complication would be involved—enough perhaps to offset the advantages. In fact, the management of the railway considers that with fifteen-minute service in each direction train crews do not have enough time to receive train orders properly and that the time spent in telephoning to a dispatcher when there is necessity for haste is of questionable value. Of course, telephones are used on the line to a limited extent, being installed at a few stations, but they are intended for emergency only.

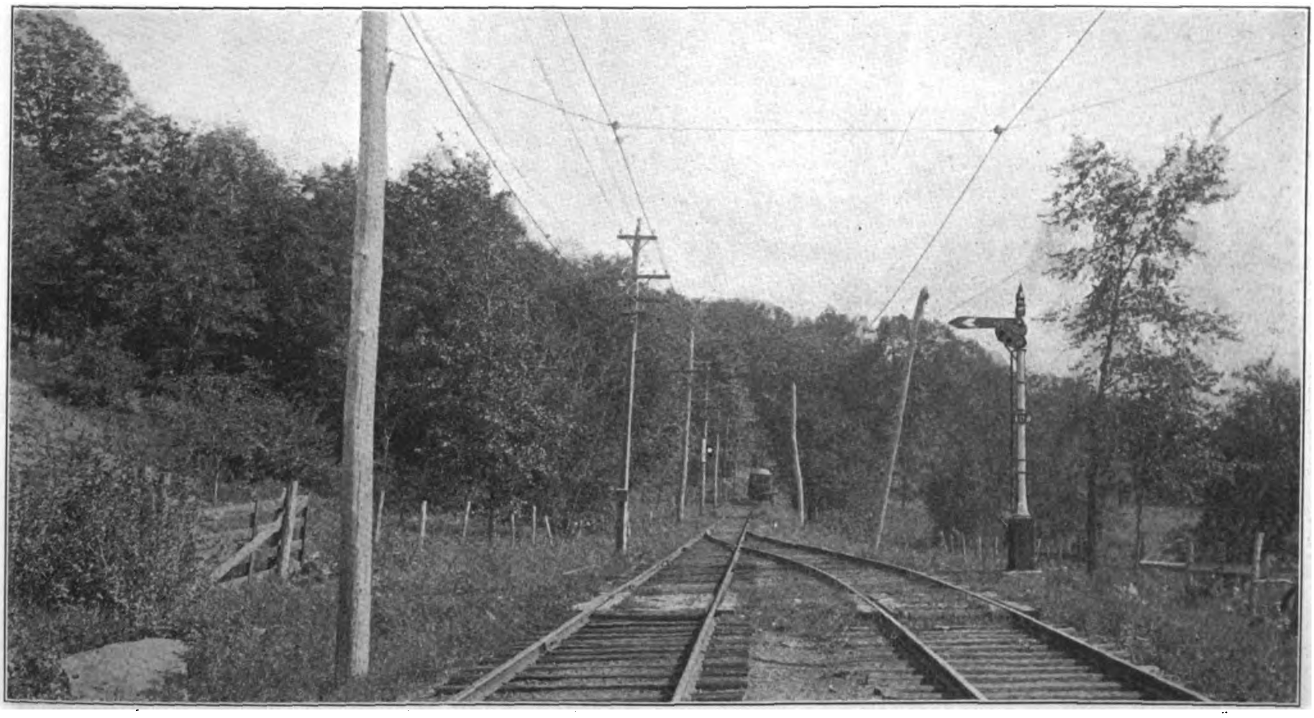
It is a rule of the company never to send out more than one green man on a car, but, as a matter of fact, since the automatic signals have been installed the operations on the road have been reduced to the simple formula that a horizontal semaphore or red light means "stop" and an inclined semaphore or green light means "proceed."

To the automatic signal system, therefore, has been assigned the vitally important duty of traffic acceleration in addition to its other features of (*a*) protection, (*b*) publicity and advertising effect, (*c*) a cost of about 10 per cent of that of double-tracking, (*d*) signal apparatus which can be used on future double track, and (*e*) provision of current at a voltage suitable for switch and station lighting.

SIGNAL SYSTEM

In the determination of the general style of signaling the adoption of the absolute (one car to a block) principle and control by continuous a.c. track circuits was considered necessary by the railway company, and a contract was given to the Union Switch & Signal Company for an installation of the "T.D.B." (Traffic Direction Block) system, which provides two absolute blocks between sidings for following cars and holds all opposing cars at the siding in advance. The fact that this system of signaling has been installed with 368 signals protecting 198 miles of track on eight different roads since its introduction early in 1913 was stated to have largely influenced this decision.

This scheme does not employ preliminaries, hence each block from siding to siding is a unit, and cars in one block or at one siding do not affect the movement of opposing cars in or approaching the adjoining block. Consideration of the two types of signals, semaphore and light resulted in placing semaphore signals at the

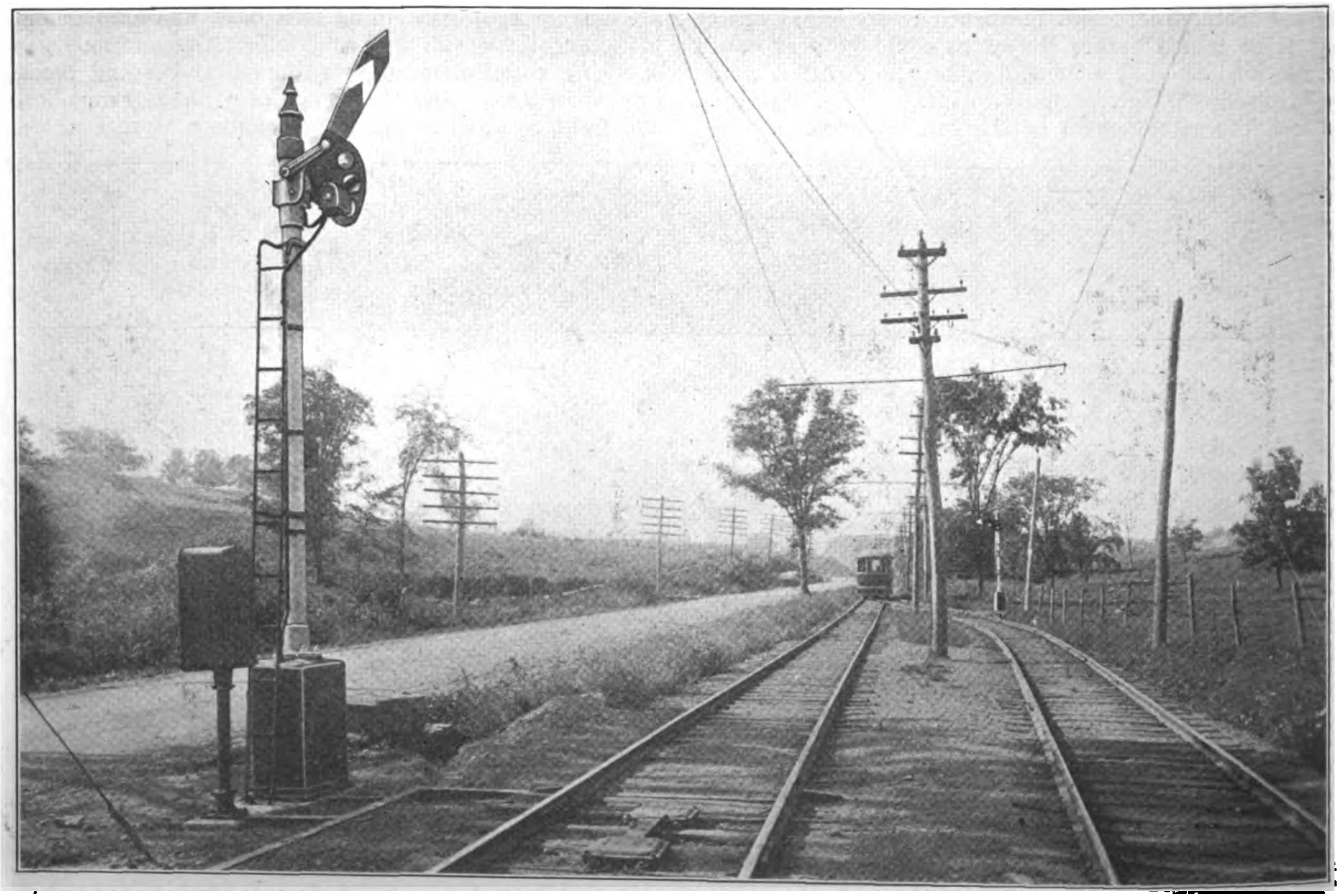


SCRANTON & BINGHAMTON TRAFFIC—VIEW OF SEMAPHORE SIGNAL IN STOP POSITION, SHOWING ALSO DIRECTION INDICATOR ON POLE BEYOND SWITCH sidings and light signals intermediate to the sidings. Semaphores were placed at sidings because their indications could be seen from any point in the vicinity of the siding, because they were standard in steam road signaling, thus inspiring confidence on the part of the public, and because of their advertising value. Light signals were used as intermediates between sidings because they could be viewed from the front only and because they could be secured at a slightly lower cost. Automatic signal construction at the present time has been completed for a distance of about ten miles of track in the zone of heaviest traffic, hand-throw signals being used on the outlying sections of the line. The territory protected by automatic signals is divided into ten blocks, siding to siding, with a total of forty signals, twenty of the semaphore type and twenty of the light type. The distances between sidings are from 3600 ft. to 6800 ft. and the blocks for following cars are from 2500 ft. to 4400 ft. in length. All passing sidings are double ended and have spring switches that make cars take the right-hand track in all cases. This plan was adopted to reduce time spent in making meets.

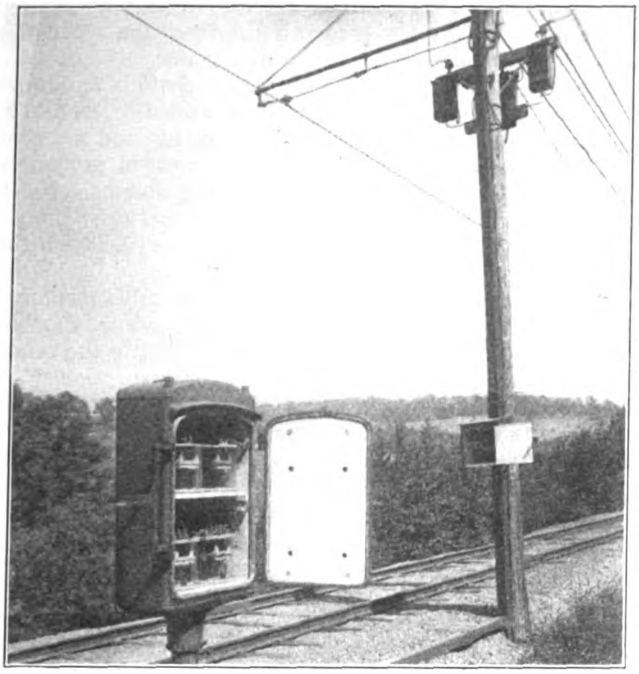
The semaphore signals at the sidings are generally located at the fouling points, but in some cases it was found necessary to place the signals beyond the sidings because of local traffic and track conditions. Several signals had to be placed on the left-hand side of the track because of the highway or restricted right-of-way.

Each signal, semaphore or light, has but two indications, "stop" and "proceed," and they are controlled, briefly stated, as follows: A siding or semaphore signal, north bound, for instance, is controlled to the next siding north by all south-bound cars and to a point just beyond the center of this distance by all north-bound cars. This permits a spacing between following cars equal to a little more than one-half the distance between sidings. Intermediate or light signals are controlled to the next siding by all cars, north or south bound. When two cars are between sidings one is protected in the rear by the siding semaphore signal, the other by the intermediate light signal and both are protected head on by the opposing signal at the siding in advance. The apparatus of any block of this system becomes normal as soon as all cars are out of the block and does not require any sequence of movement to operate properly.

A new feature, peculiar to and adapted to expedite operation as conducted on this road is the employment of direction indicators, which are located about 200 ft. beyond the siding semaphore signals, to show a motorman who has just passed a siding signal whether an opposing train has simultaneously entered the block at the siding in advance. These indicators are of the light type with one white lens normally dark, or unlighted, but displaying a white light as a car passes the semaphore, or siding signal, if an opposing car has not entered the block at the advance siding. The two indicators, one at each end of each block, are so controlled that but one of the two will be lighted at any one time, this being determined by the first car entering the block. When a car enters a block and finds that the direction indicator does not light up it backs out and if bound south tries to enter the block a second time. If the train is bound north and has inferior directional rights it waits in the clear until the opposing train arrives. It is to be understood that without direction indicators, or if they are not observed, two opposing cars, leaving adjacent sidings at the same time, would proceed until stopped a safe distance apart by the intermediate light signals, the direction indicators serving mainly to prevent the delay that would be caused if a car had to back from an intermediate signal to the siding at the rear. The direction indicator, however, does not merely repeat the indication of the intermediate signal but takes its indication from



SCRANTON & BINGHAMTON TRAFFIC—SEMAPHORE SIGNALS IN PROCEED AND STOP POSITIONS, IMPEDANCE BONDS AND TWO-WAY RELAY BOX—BACK LIGHT SHOWN ON SEMAPHORE IN FOREGROUND



SCRANTON & BINGHAMTON TRAFFIC—VANE TYPE LINE RELAYS IN FOUR-WAY RELAY BOX; SPARK-GAP LIGHTNING ARRESTERS ON POLE

a line relay controlled by the track relay at the opposite end of the block, a circuit breaker being mounted on the rear semaphore to put the indicator light out when this arm is in proceed position.

The signals installed on the south end of the line have been in service since July 1, 1914, and their performance to date has fully justified the confidence placed in the installation. Holidays and the heavy summer business have passed with exceptionally few failures really chargeable to the signal system or maintenance, and most of these failures have been incidental to a new system. Under the fifteen-minute service the twenty semaphore signals make 2940 movements per day of twenty hours, and on July 4, 1914, the twenty semaphores made 2980 movements. Provision for signal failures is made by inserting a flagging rule in the code.

SIGNAL CIRCUITS

The signal system is operated by 2300-volt, single-phase, twenty-five-cycle current transmitted over two No. 10, bare copper line wires extending the length of the signalled territory. Current is supplied these wires from the railway power house, where there is available 370 volts which is stepped up through suitable transformers to 2300 volts. A one-panel switchboard with switches and an ammeter is used for control of this supply.

Each section of track from one siding to the next siding is one track circuit with a track relay at each siding and in the center, a transformer, stepping down from the 2300 volts to from 6 volts to 10 volts. Each track relay is controlled by the territory between the relay and the transformer plus about 10 per cent or 15 per cent of the distance between the transformer and the next siding, this making a section of track each side of the transformer which controls both track relays. The track circuit current supply is adjusted by means of taps on the transformers and a reactance coil located in a box mounted on the same trolley pole about 5 ft. above the ground.

The track relays are of the Union Switch & Signal Company's galvanometer type having an armature consisting of a coil energized by the a.c. track circuit current received via the rails from the track transformers. The armature coil is in the field of a coil that is energized by a 110-volt current from a 0.6-kva transformer located at the siding, and the inductive action holds the armature in a position to close the signal circuit when current is flowing through both coils. The armature is mounted on centers and its movement is rotary.

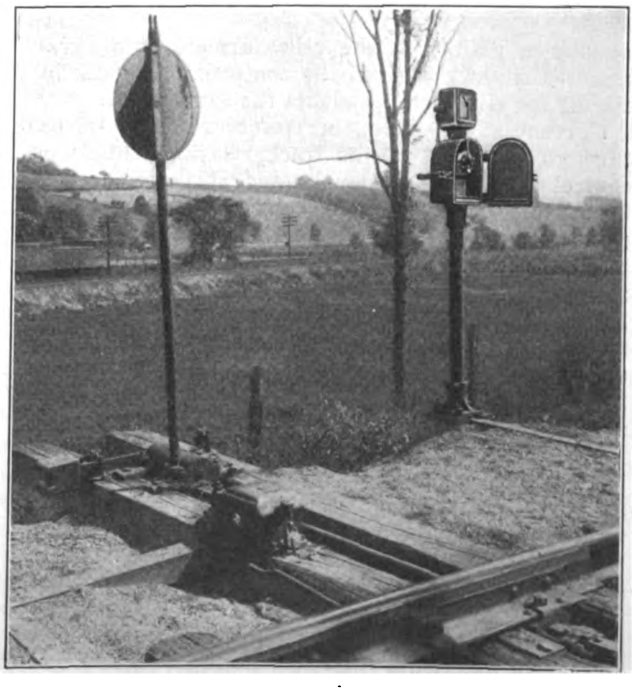
All circuits are fused and resistances are employed in connection with certain of the track relays in order to better meet ballast and other conditions of the track circuits, the fuses and resistances being placed in the relay boxes. The impedance bonds used at the ends of the track circuit have a normal capacity of 500 amp per rail and an overload capacity of 750 amp for one hour without undue heating. The track circuits are carried to the fouling point of all switches in the track sections, so that cars must be in clear before the signals will show a clear block.

Keystone insulated rail joints, manufactured by the Union Switch & Signal Company, are used to limit the track circuits at sidings, and insulations in the switch roads provide a means for extending the track circuits through the switches. All track circuits are of the "double rail" type, which permits the use of both rails for the propulsion current return.

SIGNALS

The semaphore signals are the Union Switch & Signal Company's Style "B," bottom-post mechanism, two position 0 deg. to 60 deg., operating the arm in the upper, left-hand quadrant. The mechanism is operated by a 110-volt induction motor and the slot magnet, or holding-clear coil, operates a contact controlling the motor circuit, thus eliminating the use of the line relay ordinarily required for the light signals. The signal is illuminated by two 110-volt, 2-cp lamps.

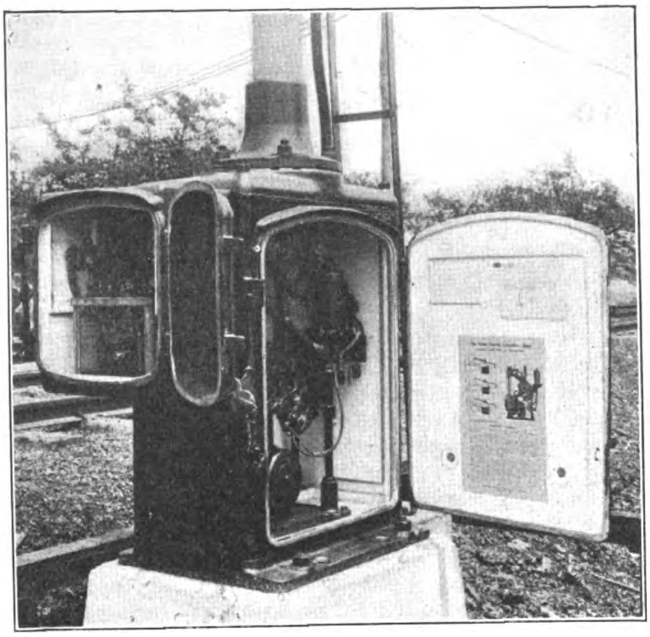
The light signals are Union Switch & Signal Company's "Model 13" having two 8-in. lenses, one red and one green, with a hood and an artificial background. Each is mounted on a 5-in. pipe post and has a concrete foundation. Behind each lens are two 110-volt, 25-watt tungsten lamps wired in multiple, so that if one burns out the other will provide an indication discernible at



SCRANTON & BINGHAMTON TRAFFIC—VIEW SHOWING SWITCH CONTROLLER AND SWITCH INDICATOR WITH TIME RELEASE AT INDUSTRIAL SIDING short range. With both lights burning this signal will provide an indication visible from 2000 ft. to 2500 ft. away under the most severe daylight conditions. The signal posts are painted white, thereby making them distinctive at night even though the lights may be out.

LINE CIRCUITS AND CONTROL

All circuits and apparatus are designed so that a break in a wire or rail or a failure in the supply of current will result in the display of stop, or safe, signals. Gravity is employed to move all relays and signals to the stop position and power is used only to move them to the clear or proceed position. When both coils of a track relay are properly energized its contacts, controlling the line and signal circuits, are closed. The entrance of a pair of wheels on the track circuit shunts the current from the track-relay coil, due to a lower resistance path, and the relay armature, by gravity, revolves slightly to open the contacts. A break in the circuit for either coil produces the same effect.



SCRANTON & BINGHAMTON TRAFFIC—VIEW SHOWING SEMAPHORE SIGNAL MECHANISM, WITH TRACK RELAY IN BOX MOUNTED ON SIGNAL MECHANISM CASE

Current at 110 volts, heretofore referred to, passes through a contact of the track relay and line wire to control a vane-type relay located at the center of the block, this relay, when energized, closing through its contact the current supply for the green light indication of the intermediate light signal, and when de-energized closing another contact to establish a circuit for the red light indication of the same signal. The semaphore signal is controlled by this vane relay and a contact on the other relay, located at this semaphore signal. A second vane relay and a similar circuit is employed to control the other intermediate signal.

As previously described, each siding semaphore signal is controlled to the advance siding by opposing cars and to a point just beyond the center of this territory by following cars, and this double control is secured by the use of two more vane relays for each block which act to limit or extend the control of the semaphore signals according to the direction of traffic established as a car enters the block at a siding. These relays are similar to the relays used for the light signals and are also located in the center of the block. Switch circuit controllers are connected to the points of all rigid switches, that is, all that are not trailed through. These controllers are arranged to set all signals governing traffic over the switches to the stop position when the points are not closed for main-line traffic.

Lightning arresters of the Union Switch & Signal Company's new spark-gap type are tapped to each 110-volt wire between the lines and apparatus and are connected to deep grounds. These have proven protective through the numerous heavy lightning storms. No. 9 soft-drawn, insulated wire is employed between the relays and the rails, and No. 14 wire is used between the line wire and apparatus, both being protected by 1¼-in. grooved lumber. All wires are run to suitable terminals or fuses in the relay boxes and signals and are flexible. No. 14 electric-light cord is used to connect to the relays so that they can be readily moved for inspection.

Several of the switches require indicators to govern movements on to the main track. These indicators are of the semaphore type, a horizontal arm indicating "Stop, stay in siding." The indicator is cleared to permit movements when the conductor starts a time release switch, after the lapse of about fifteen seconds, will produce a clear indication if the block is unoccupied. The time-release control is used instead of the usual control by track circuit preliminaries, thereby reducing to a minimum possible delays by trains which might be in the preliminaries.

R. W. Day, general manager Scranton & Binghamton Railroad; R. L. Koehler, general superintendent, and J. C. Meixel, superintendent of transportation, selected the signal system, supervised its installation by the manufacturer, and developed the operating methods which are now in effect on the railway.

United States Railway Statistics

The bureau of railway economics has just published a 75-page pamphlet giving statistics of railways in the United States for the period from 1900 to 1912, inclusive. The railroad tabulations are based upon official data published by the Interstate Commerce Commission for each fiscal year from 1900 to 1912, the latest year for which such data is available. Tabulations concerning population and area are based upon the reports of the bureau of the census. The tables appearing in the book are grouped under the following headings: Population and area; railroad mileage; capital, securities and dividends; revenues, expenses and taxes; employees and compensation; equipment; freight traffic statistics and passenger traffic statistics. It is stated that during the years covered by the statistics the commission prescribed certain changes in accounting regulations and statistical methods, but that these do not seriously impair the value of the statistics for comparative purposes or disturb their general trend.

Thirty-fifth Anniversary of Electric Lighting

On Wednesday, Oct. 21, will occur the thirty-fifth anniversary of the invention of the electric incandescent lamp by Thomas A. Edison. This day in 1879 may be said to mark the birth of electric lighting. Certainly it marked the birth of the general and popular use of electric lamps. Arc lamps had been in use some years previous to this time, but only a few of these were then employed for searchlights, to light theatres, parks, street corners and similar public places. The universal lighting of both public buildings of all kinds as well as private dwellings by electricity through small units became a dream realized only when Edison first successfully made his electric filament bulb glow in his laboratory at Menlo Park, N. J.

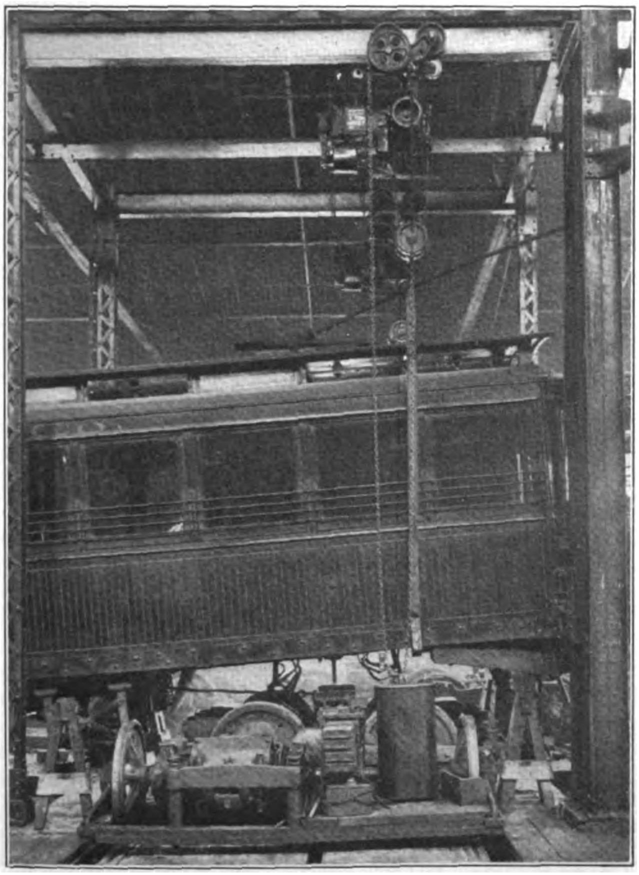
Labor Saving Devices at Pittsburgh

Several Novel Labor and Time-Saving Devices in the Pittsburgh Railways Company's Shops Are Described in Detail, Most of Them Being Peculiarly Adaptable to Electric Railway Shops Where a Considerable Degree of Congestion Exists

A large part of the heavy repair work for the Pittsburgh Railways Company, which operates about 1000 passenger cars, is done at its Homewood shops, and as these shops are somewhat restricted in size the necessity for saving space and for quick handling of cars is an exceedingly important feature. The company has, in consequence, installed in the shops a number of novel pieces of apparatus which have been developed by F. R. Phillips, superintendent of equipment Pittsburgh Railways, for the purpose of saving time and labor in the work of overhauling cars.

Probably the most important of these devices is a home-made car hoist which is used for making truck repairs upon cars which do not need any repairs to the body. This is shown in one of the accompanying illustrations. The hoist has been constructed by attaching to two roof trusses of the shop a pair of I-beams spaced about 10 ft. apart. These I-beams are carried upon latticed columns, and each supports an electric hoist from which is hung a flat hook that catches under the side sill on either side of the car.

The electric hoists, which are of the standard Sprague electric type and which are of two tons capacity each, run upon the lower flanges of each of the I-beams. They are moved in a transverse direction as desired by means of pendant chains attached to a geared drive for the supporting wheels and the transverse movement is effected by hand. Hoisting is effected by a motor-driven drum upon which is wound a cable that carries in a double loop a sheaveblock of the usual type. From the blocks depend the hooks for hoisting the car. The electric-hoist motors are operated from the lighting circuit for the shops, and controllers are mounted in a suitable manner over the hoist framing and are operated together by a single shaft. Sheaves are keyed to the shaft and operated by pendant cords. The current is supplied to the hoist motors by flexible cables which are provided with ample loops to permit transverse longitudinal movement of the hoist along the I-beam support, so that the best point of support on the car sill can be selected. The two hoists are operated in unison by means of a common shaft for both controllers, as described above.



PITTSBURGH SHOPS—ELECTRIC CAR-BODY HOIST FOR REPLACING CAR TRUCKS

In operation, a flush transfer table is centered on the track that is spanned by the structure, and the car which is to have its truck removed is run over the transfer table. The hooks for the hoist are then caught underneath the side-sills of the car, and the car body is raised when current is supplied to the electric hoist motors. The car is thus raised clear from its truck. The leads to the motors and the connection to the brake rigging are then disconnected. The transfer table, which is operated by electricity, is then moved out to one side, and the truck is either shoved off upon some other track or else handled by an overhead crane which spans the shop bay running alongside of the car hoist track.

When the truck is replaced, the reverse of this process is carried out, the new truck being run under the flush transfer table, moved underneath the car and the hoist motors reversed, letting the car down into place. Two men do all the necessary shifting of cars and trucks and the hoisting of the cars off their trucks and the disconnecting of the motor leads. With the help of the car hoist these two men may easily change trucks upon twenty cars each day, including the shifting of cars and trucks in and out of the shops and yards.

The average time required for the complete operation of moving the car under the hoist, disconnecting the leads, removing and replacing the truck and again connecting the leads is from four to six minutes. A large stock of spare trucks is kept on hand in the shops, and when anything more than very light repairs is required for the truck a substitution is made so that the car is not held for any length of time.

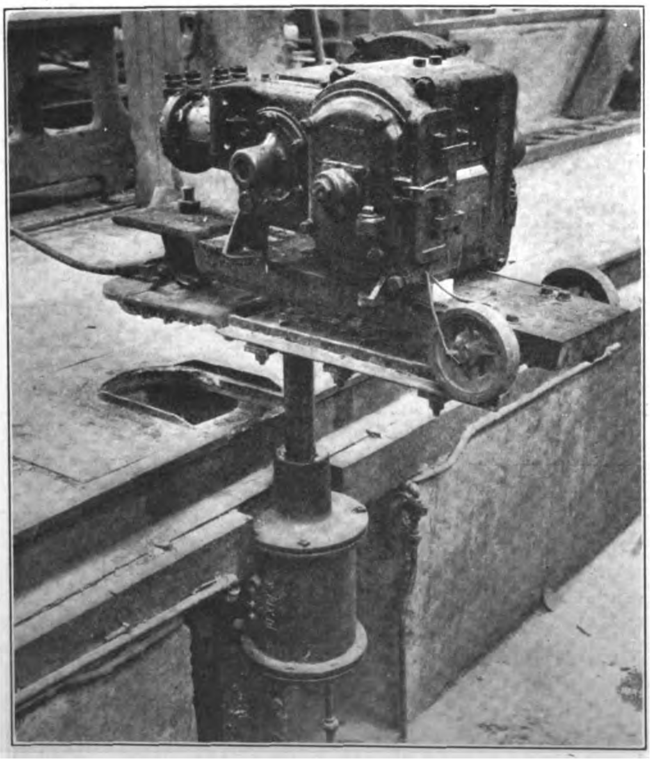
The accompanying illustration shows a car body in raised position and ready for the truck to be moved out sidewise by the flush transfer table. It will be seen that one of the building columns has been used as a support for the overhead structure of the hoist, and this, together with the tie rods and the roof trusses, makes the whole construction a thoroughly rigid one. The line switches and circuit breakers for the hoists are shown mounted upon this column at about the same elevation as the sills of the car body.

The cost of this home-made hoist complete was $600, exclusive of the cost of the flush transfer table, which has been in use in the shops for some time. This includes the cost of the two 2-ton hoists with their controllers, the longitudinal I-beams upon which the hoists travel and the vertical columns, each of the latter being built up from two channels set back to back and spaced by lattice work. The clear length between columns is 12 ft., and the longitudinal movement of the hoist overhead along the I-beams is 8 ft., thus permitting considerable variation in the position on the side-sills of the car at which the hoisting hooks are engaged.

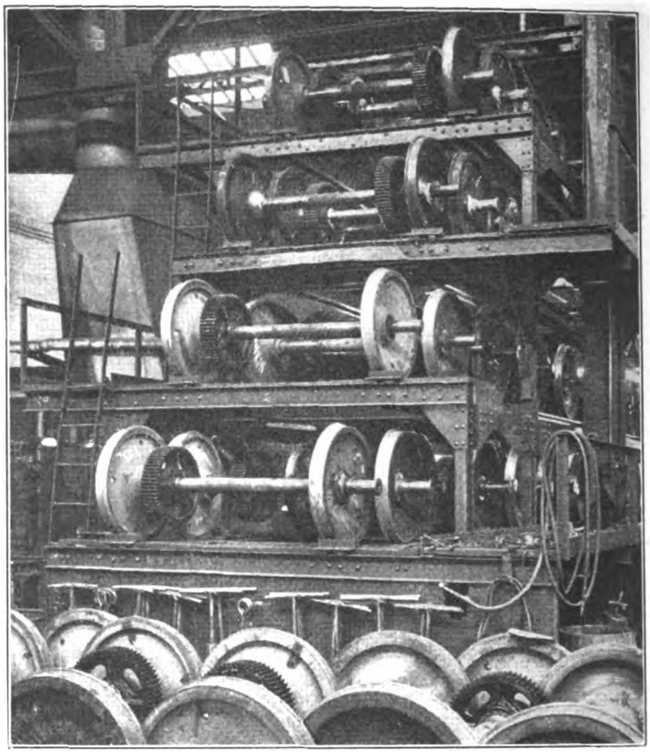
AIR COMPRESSOR HOIST

Another one of the home-made devices is a compressor hoist which has been developed so that defective compressors may be removed from cars and replaced by new ones with the minimum expense of time and labor. The hoist is made up from a 10-in. x 12-in. air-brake cylinder mounted at the side of one of the shop pits upon strap-iron supports. The cylinder is operated by compressed air from the shop system, a two-way valve being used for controlling it. Upon the end of the brake cylinder piston is attached a table, and at the edges of this table are supported a pair of tracks made from angle irons. Upon these tracks runs a small truck specially built for handling air compressors. This is furnished with flangeless wheels, of which two are fixed at one end. A swiveling wheel and handle are provided at the other end so that the truck can be drawn about the shop floor as desired.

In operation, when a car comes in to have the air compressor changed, the car is so placed that the air compressor is directly over the cylinder of the compressor hoist. The small truck is then shoved on to the table and air is admitted to the hoisting cylinder, thus raising the truck until it touches the compressor. When the weight of the compressor is carried by the table the keys attaching the compressor to the cradle supports are removed and the table with the compressor upon the truck is lowered to the floor level. The truck is then drawn from the table and taken to any part of the shop desired. The reverse of the process is then carried out and the new compressor is keyed into place, the whole procedure generally taking not more than from three to four minutes. A number of these small trucks are in use in the shop for transporting air compressors from place to place.



PITTSBURGH SHOPS—HOME-MADE HOIST FOR REMOVING AND REPLACING AIR COMPRESSORS; HOIST CARRYING COMPRESSOR AND TRUCK



PITTSBURGH SHOPS—FOUR-DECK STRUCTURE FOR STORING WHEELS INSIDE OF TRUCK SHOP

It will be noticed from an accompanying illustration that the head of the rail opposite the hoist cylinder has been cut away. Into this space fits a part of the table top which is grooved transversely so that the car wheel in passing over the table travels along this groove. The portion of the table outside of the groove sets in a space that has been cut out of the floor, leaving the floor flush when the table is in its lowest position. This arrangement provides a continuous track at floor level, so that there is no difficulty in pulling the truck off the table or pushing it on to the table when it is carrying a compressor. The cost of this device was practically negligible, the material used in it being taken from scrap stock at the shops, but it is obviously a very great time saver.

WHEEL-STORAGE STRUCTURE

One of the accompanying illustrations shows a four-deck, wheel-storage structure that has been installed in the shops not only on account of the opportunity which it affords to save labor but also because of the high cost of the land in the vicinity in which the shops now stand. As will be seen from the illustration, the wheel storage is built of structural steel and it has double tracks on each of the four levels, so that the wheels on each level can be staggered. At one side of each level there is a platform for use by the men who move the wheels about on the various decks. The structure extends out into the main bay of the machine shop which is served by a traveling electric crane, so that the crane can be used to pick up the end pair of wheels from any one of the decks, the four decks being arranged so that each one extends out beyond the one immediately above it.

This wheel storage scheme cost, completely erected, about $1,400. The advantages, in addition to providing an easy method of handling wheels in connection with a traveling electric crane, consist in the fact that the wheels and axles are always under cover and in consequence are not as subject to rust as they would be if kept outside. In addition the stored wheels are kept convenient to the truck shop at all times, and are available at once in accordance with the needs of the work.

ARMATURE CAR

All of the armature repairs for the system are made at the Homewood shop, and from this point the repaired armatures are shipped to the various other shops and carhouses on the system. To facilitate the work of transportation an old car has been arranged specially for this work. A center door has been cut in each side, and just inside and at the front of each doorway is a jib crane having a lifting capacity of 2000 lb. Both of the cranes are operated by means of an air cylinder supplied from the air-brake system. A pulley block is installed at the end of the piston, and the cable to the crane hook is led over this to give a 2:1 increase in motion of the hook that hangs from the end of the jib. The hook is made double and hangs from a yoke in accordance with the usual scheme for handling armatures, one of the hooks engaging with the armature shaft on either side of the armature. As the cranes swing over the car floor and out of the doorways the armatures can be handled with a minimum of lost time between the level of the armature-car floor and the ground, and in addition no skids or rollers are required.

Meeting of Federation of Trade Press Associations

Publishers, editors, circulation managers and advertising men to the number of more than 400 attended the ninth annual convention of the Federation of Trade Press Associations at Congress Hotel, Chicago, on Sept. 24, 25 and 26. F. B. Porter, Chicago, *National Builder*, president of the federation, called the meeting to order, and A. A. Gray, *Electrical Review and Western Electrician*, president of the Chicago Trade Press Association, delivered the address of welcome. Mr. Porter recommended the appointment of a permanent secretary. Secretary E. E. Haight, Chicago, *Motor Age*, reported that the federation had 216 members. Charles T. Root, New York, presented the report on the reorganization of the association.

Arthur L. Rice, Chicago, *Practical Engineer*, was chairman at the editorial symposium of Sept. 24. David Beecroft, New York, Class Journal Company, read a paper on "Feature Articles." He said that he had examined sixty trade papers and fifty had no feature articles. Dr. William A. Colledge, of the Redpath Lyceum Bureau, Chicago, made the point that there is as much "human interest" in the average trade paper as in the average general magazine. James H. McGraw, president of the McGraw Publishing Company, Inc., publisher of the ELECTRIC RAILWAY JOURNAL, New York, declared that editors must write out of the fullness of knowledge, and that technical papers should be edited from the field and not from the desk.

At the circulation symposium, S. T. Henry, New York, McGraw Publishing Company, Inc., urged co-operation between editors and circulation managers. The speaker told how the list of circulation "prospects" should be made up. Every prospect must be a potential reader and not merely a possible subscriber and each new subscriber should be told how to get the most out of the paper. Mr. McGraw averred that the circulation department is the most important on the paper. If every man in the organization is studying the problems of this department, there will be no publisher who will be averse to emblazoning his circulation figures on all the dead walls of the country. A. H. McQuilkin, Chicago, *Business Equipment Journal*, declared that editors should be permeated with the idea of service.

A. A. Gray in the absence of the author read a paper "How Trade Paper Advertising Should Be Sold," written by William H. Ukers, New York, *Tea and Coffee Trade Journal*. Mr. Ukers contended that if advertising were bought more intelligently it would stay sold more often. Advertising in a trade paper should be a quality purchase. Charles L. Benjamin, Milwaukee, advertising manager for the Cutler-Hammer Manufacturing Company, argued that advertising of some kind is necessary in order to sell any product. He described the mental processes of creating desire, overcoming inertia and instilling a preference for the thing advertised.

The subscriber's point of view was considered in three papers or addresses on the afternoon of Sept. 25. John W. Alvord, Chicago, sanitary engineer, read a paper "The Importance of the Technical Press to Engineers." This paper is abstracted at length in this issue. Mr. Alvord said that the chief value of technical journal matter lies in the fund of small bits of information it provides in relation to every-day jobs rather than in longer articles on unusual undertakings. The speaker described his method of indexing articles in loose-leaf working notebooks. R. R. Shuman, Chicago, Shuman-Booth Company, advertising agent, voiced the belief that the engineering paper "ad" of the future will be reading-matter advertising; that is, advertising that will resemble the text pages in sincerity, in restraint and somewhat in appearance.

At the publishers' symposium of Sept. 26 John Lee Mahin, Chicago, Mahin Advertising Company, declared that the good trade paper is the most powerful advertising influence per unit of circulation that exists. Mr. Mahin bespoke a better understanding between the agency and the trade press. The whole problem should be worked out on the basis of what is best for the advertiser, and, more than that, what is best for the advertiser's customer.

At the concluding session the question was debated of making circulations known. Mr. McGraw said that he believed no one act has contributed so much to the success of the McGraw papers as the printing of the exact circulation in each issue.

Officers were elected as follows: President, John Clyde Oswald, New York, *American Printer;* vice-president, A. A. Gray, Chicago, *Electrical Review and Western Electrician;* secretary and treasurer, Grant Wright, Philadelphia, *Eastern Dealer in Implements and Vehicles.*

Night Courses in Valuation of Utilities at the University of Pittsburgh

A unique feature has just been introduced to the University of Pittsburgh through the beginning of night graduate courses. This is said to be the first time that such work has been attempted in this country. The courses will be offered in several branches of engineering and will include work in the valuation of public utilities. Professors Morris Knowles, director of the department of sanitary engineering, and G. W. Case, both of the faculty of the University of Pittsburgh, and William S. Moorehead will give the instruction in "valuation." The faculty also includes Paul M. Lincoln, consulting engineer of the Westinghouse Electric & Manufacturing Company; D. S. Crawford, general superintendent of motive power of the Pennsylvania Railroad lines west of Pittsburgh; Professors L. E. Endsley, R. T. Stewart, J. Hammond Smith and others. The work is under the general direction of the dean of the engineering college, F. L. Bishop.

How to Use the Technical Journal*

Value to Different Classes of Readers—Discussion of Card Catalogs and Other Forms of Indexing—How to Get the Most Out of a Paper.

In 1880, the engineer treasured and indexed almost every scrap of printed matter on any engineering subject that came his way. To-day his task is to sort out, discard and eliminate that which he can no longer use, and limit himself to the inspection and reading of that which bears principally on his selected professional specialty.

That we cannot keep abreast of the times without reading the engineering journals is obvious. That if we carefully read all the engineering journals in our chosen specialty we would have no time left to earn a living is easily capable of demonstration. What, then, is the proper attitude to adopt toward this ever-increasing flood of information that pours in upon us so relentlessly?

SUBSCRIBERS' ATTITUDE TOWARD PAPER

If we look about us to see how our fellow engineers solve this matter we shall find a great variety of attitude toward the problem. Some engineers simply do not take engineering journals, reading one occasionally here and there as opportunity offers. Others take all they can afford to take and let them pile up around the office, often unopened and unused. Others still limit themselves to a select few, which they carefully bind and shelve. Still others read journals when they can, and throw them away when they move on. As a rule, however, the engineer prizes his technical paper, and endeavors in some ill-defined and formless sort of fashion to preserve its information for future use. Generally he fails to find any practical scheme which makes his rapidly accumulating material of much value to him after it has once passed under his eye, and for a large number of engineers technical journals are only professional newspapers with which to idle away an hour or so and satisfy their curiosity. That their value is something much more than this, or should be more than this, is so apparent as to need no denial.

The problem of the engineer with his technical paper is much affected by his age, station and aim in life. To the man who is engineering only to get money and more money, the engineering journal is a newspaper, in which he may notice mainly where there are better jobs than his own that may be sought after and perhaps obtained. To the man who is anxious to fit himself every year of his life for something better it is an opportunity, quite unequaled many years ago, for a great variety of study. To the young engineer the engineering journal, properly read and noted, is a part of a post-graduate course in engineering. To the middle-aged man it is a mine of data, bearing in all sorts of ways on his work; and to the mature specialist only does it begin to become burdensome by its repetition of experience, and its volume of matter on subject which has already, to him at least, been well digested. Let us see if we can outline how each of these classes can get more profit out of the matter contained in the engineering journals than do the careless or the indifferent, who, after their journal is once looked over, let it go to waste or idleness.

PROBLEM OF YOUNG ENGINEER

The young engineer and the college graduate need, most of all, practical experience. It is safe to say that engineering literature will never have any proper perspective for him until he has been connected in some capacity with engineering work himself, be it in ever so modest a capacity. With the actual doing of engineering work, however, should come contemporaneously the reading of technical journals, particularly along the lines in which he is working. Nothing can be more instructive, broadening, and enlightening to a man doing a particular kind of work than reading about similar work at the same time. It follows, therefore, that the young engineer should, as early as possible, take at least one first-class engineering journal and own it himself; bind it if he can afford to, but lay it away in an orderly manner, in any event. If he can afford two journals so much the better.

It is to be doubted if laborious reading of all kinds of engineering articles all the time is advisable for anyone. Mere quantity of reading is mentally detrimental. If one might advise, it would be to suggest enforced systematic reading of all articles particularly bearing on the line of work the reader is immediately engaged upon, and the optional reading only of such other articles as interest him. This ought not to be much of a task. In course of time as his experience broadens, engineering reading will become less burdensome and more interesting because its relation to practical matters will be more and more appreciated, and the discriminating use of engineering literature better understood. Of course, all this applies to engineering societies as well; but that is another story.

It is probably not wise for the young engineer to indulge extensively in card indexes, filing systems, and the like, for topically arranging his available engineering journal articles. Few men know very early in life where fate and interest will land their future attention, and filing systems and special indexes are expensive and time consuming, and when indulged in without definite aim nearly always quickly become too voluminous and thereby useless. If any suggestions are made along this line, it would be to start a loose leaf, letter size ($8\frac{1}{2}$-in. x 11-in. page) notebook and note in it (separate pages for separate subjects) only what appears to be extremely useful, either in exceedingly brief abstracts from articles, or diagrams and costs.

The young engineer is tempted to read much about large enterprises—the Panama Canal, big bridges, astonishing tunnels, great dams. This does no harm, and probably holds his interest for the time being. Gradually he learns that, for him at least, the chief value of the technical journal does not lie in its dramatic side, necessary as that may be for our general information, interest and pleasure, but its chief value lies in a fund of small things, which make up routine work of the ordinary every-day job. These are to be watched for, and noted, as practically useful to the average man.

THE MIDDLE-AGED READER

We next come to the man in early middle life, actively engaged in his profession, and note at once that his problem with the technical journal is the absence of "time." Absorbed in a multitude of responsibilities, harassed with unexpected difficulties, worn out at night with the long day of strain, how shall he derive any useful good from the multitude of journals which his more ample income can readily afford, but which pile high on his table after every brief absence from the office? Whether or no such an engineer shall make any effort systematically to assimilate, file, and study current technical journals depends in part upon the nature of his routine. If he is largely engaged in administrative work, or is a salaried officer in a large enterprise with a comparatively limited range of problem or a limited call for miscellaneous data, he may generally be content with a cursory examination of the engineering journal such as will keep him qualified on his undertaking, and the preservation of such journals in bound form, with the standard published indexes. If, however, he is entering upon novel work, or work presenting a great variety of problems, overlapping into a great variety of fields, ambition will compel him to do more than this, and some form of special indexing will appeal to him more or less strongly as he feels the need more often for research in up-to-date material.

---

*Abstract of a paper presented by John W. Alvord, consulting engineer, Chicago, at the Convention of the Federation of Trade Press Associations, Chicago, September 24-26.

The average editor can judge of a technical article with only a brief inspection—a sentence here and there, a headline, and a moment's reading of the summary and conclusion. Long familiarity with matter of a similar character gives him the assurance that he can detect in this rapid review anything novel, new, or original, and can fairly pass judgment upon it in a general way. The working engineer who has had some experience with technical literature can form the same habit, and save much time. It is really wonderful how much repetition there is in engineering writing and in the production of engineering papers. It thus happens that we are under the necessity of seeing much the same facts and principles repeatedly published in varying form, for some one is always attracted to really read them, with consequent benefit to himself, under the belief that they are new and novel.

The mature engineer notes that a large amount of engineering literature is of the purely descriptive order, merely giving outline of work that has been accomplished without going into reasons or principles. All this kind of writing is valuable and useful, and has its proper place, but all of this class of literature has its limitations. One of the most severe of its limitations is that it rarely describes mistakes, errors of judgment, or failures, and in these lie the most valuable lessons to the seeker after truth. One is obliged to read between the lines or read with reservation, much as one does in reading accounts of battles in the daily press. It is always wise to look back and note the origin of the despatches in such cases.

A tremendous lot of engineering literature is written which is of little permanent value. Often it represents the writer's struggles to understand a subject. Often it is compiled largely from a desire for publicity. Fortunately the editors of the technical papers can limit this kind of reading by care in selection.

SEPARATING WHEAT FROM CHAFF

But amid all these drawbacks a discriminating mind will always find a great deal of wheat amid the chaff, and the wheat that will be gleaned will be of differing kind and amount, depending upon the type of mind of the reader, his present problem, and his desire to systematize his information. What, therefore, shall he do with his special selection when once he thinks he has separated it from the flood of raw material?

Several courses are open to him:

First, he may rely on his memory and the published index to his bound volumes. It is safe to say, however, that few engineers really make much practical use of this method. The intervening index and the bother of a search prove to be discouraging to that degree that a proposed reference search is abandoned in about one-half the suggested attempts. The ideal filing system is one in which, with the least amount of effort, one can put his hand immediately and accurately on the thing itself, be it a book, pamphlet, or a data sheet.

Second, he may keep a special card index of important data and reference to valuable articles. This at once involves labor and attention which few busy men can give and which, if done by assistants or librarians, largely loses its personal value to the one who needs it. The same objection as to the discouraging effect of intervening indexes holds good here, too, and it is further safe to say that of all the contrivances for indexing the most difficult to handle readily and examine rapidly is the card index system.

Third, he may abstract important data in a limited way on loose-leaf transparent paper, standard letter-size, and he may remove or detach articles of special value from out his journals, to be filed in regular office file system, like correspondence.

The writer has tried all of the above methods at considerable cost in time and patience, and has, for many years, settled upon the third method. With all its admitted limitations it seems to be the best for an office which is expected to find out information on a great variety of subjects in a limited time, and with the least amount of effort.

THE MATURE ENGINEER

We come finally to the mature and experienced engineer of advancing years. How can he make engineering and technical literature of use? It is safe to say that when an engineer has much passed fifty or sixty years of age and has led an active life, his need for engineering literature lessens. Out of the mass of detail which seemed to him so overwhelming and endless in his youth and early manhood, fundamental principles emerge like peaks out of the clouds, and upon these as foundation all detail classifies itself simply and naturally, and therefore he feels less need for accumulated data or particular description. Probably no one enjoys engineering reading as does the mature engineer, for he can read between the lines and find much to instruct as well as interest, and yet while he is probably the most interested and intelligent reader of engineering literature that the journals have, his ambition as a collector is gone and filing systems no longer appeal to him.

If his acquaintance is wide, he reads with interest the accomplishments of his friends, and the addresses of society presidents and articles on the ethics of the profession. Of failures he is the keen student. The personal column appeals to him, and if he is of right-mindedness he is conscious of more pleasure than formerly in the accomplishments of those who have succeeded and succeeded well in dire and burdensome responsibility. More often than the young man he will turn back for his satisfaction to papers that served him well in times past, and perhaps smile at the lack of improvement that later attempts to deal with their subject often show.

Technical papers, along with the technical societies and their proceedings, form the repository of the professions; they are the interchange of experience, the common store upon which we all draw. Without them we would be strangely helpless. We are more or less indebted to everyone who records his experience for the common use, and that debt we should endeavor to helpfully repay in kind, but wisely, concisely and thoughtfully.

Dr. E. B. Rosa, secretary of the joint committee on electrolysis, states that the next meeting will be held about Nov. 15 and that in the meantime the several subcommittees are expected to prepare reports which are to be sent out to all members of the committee by Nov. 1 in order to give an opportunity for study of the topics to be taken up at the next meeting of the general committee.

LIBRARY OF THE UNIVERSITY

British and German Electrical Situation

According to British Tramway Managers, Greatest Effect of European War Is Drain on Employees—Abstracts from German Papers Showing Disturbances in Electric Industry and Advance in Prices of Electrical Machinery

ELECTRICAL CONDITIONS IN GERMANY

GERMAN TECHNICAL PAPERS FEEL EFFECTS OF WAR—10 PER CENT ADVANCE IN PRICE OF ELECTRICAL MACHINERY

After a long period of interruption the German technical papers are beginning to reach the United States, and from their contents the present great industrial disturbances in Germany are apparent. The journals themselves appear with a greatly reduced number of pages and are usually accompanied by publishers' announcements that regular publication cannot be promised at present. The levies made include not only the younger members of the editorial and business staffs, but the enrollments have also evidently deeply affected the printing, engraving and other trades connected with magazine publication.

The technical papers and engineering societies are doing their best to ameliorate conditions by urging engineers who are out of work in their usual line to offer their services, even at "existence" wages, in those industries which are exceptionally active on account of the war. Employment bureaus have already been established for this purpose. The publishers of *Electrische Kraftbetriebe und Bahnen* have issued an appeal to their readers that this is the opportune time to carry out maintenance work on the most liberal scale possible in order to give employment to men who have lost their positions because of the present disturbances. Many papers are also giving free space to appeals for Red Cross funds.

Most of the electrical manufacturers in Germany have cancelled all previous prices for equipment. Thus an advance of 10 per cent has been made in the price of electrical machinery, including the principal railway materials, exclusive of an advance of 20 per cent in the price of transformers and automatic switches. All quotations on motors and generators exceeding 100-kw capacity and on transformers exceeding 500-kva capacity have been withdrawn. Storage-battery quotations also have been withdrawn owing to the shortage of lead.

An article in the *Electrotechnische Zeitschrift* of Aug. 27 shows that in the middle of August the eight countries at war had a population of 350,000,000. Of the business done in 1913 by Germany with this population, 3¼ per cent comprised electrical equipment. Exclusive of Montenegro, the German manufacturers in 1913 did a total business of $5,832,250 with Austria-Hungary, $5,436,250 with Belgium, $4,597,750 with France, $8,605,250 with England, $9,900,250 with Russia and $73,000 with Servia. Of Germany's electrical exports, 34.62 per cent were with its present European opponents. No figures are given on the loss of business with other countries, which, of course, are now shut off from Germany, except Austria-Hungary, which took 7.06 per cent of German electrical exports.

Stahl und Eisen for Sept. 3 discusses the possibility of American iron founders capturing German business from South America and other countries. It points out that even if American manufacturers do secure orders they will be greatly handicapped because of the small number of American ships. Thus, reference is made to orders for 10,000 tons of iron for Chili and 28,000 tons for Australia which cannot go forward for this reason.

As practically all German electric railway employees are former soldiers, the railway service in many cities had to be cut down very largely during the mobilization period. In many cases women acted as conductors, 600 being so employed on the Great Berlin Street Railway alone. By the first week of September, however, conditions had improved to such a degree that it was not necessary to employ the women more than five hours a day, and it was expected that within the next two or three weeks their number would be greatly reduced. The Berlin company also announced that it would carry free of charge all enlisted soldiers, volunteers and reservists unless such traffic interferred too heavily with the regular service.

BRITISH TRAMWAY SITUATION

ACCORDING TO GENERAL MANAGERS OF LEADING SYSTEMS, EUROPEAN WAR HAS NOT MATERIALLY AFFECTED BRITISH TRAMWAYS EXCEPT AS TO DECREASE IN EMPLOYEES

Through the courtesy of the managers of several of the leading tramway systems in England, the London representative of the ELECTRIC RAILWAY JOURNAL has secured statements showing the general effect of the present European war upon the operating and financial conditions of their companies. These opinions are published below in part.

According to C. W. Mallins, general manager of the Liverpool Corporation Tramways, the tramway service in that city has not yet been appreciably affected as to receipts. The ordinary service has gone on without interruption, owing to the fact that the system had a large number of men engaged on holiday duty, which has for the present been suspended. There was also a large number of eligible men on the books for engagement who have now been brought into service. The corporation is paying the difference between the government pay and the ordinary railway wages of the 600 employees who have joined the army, so that their families will not suffer from the enlistment. Moreover, each employee is to be reinstated on return without loss of position or emolument. A large number of reservists and territorials stationed in and passing through the city are allowed to ride free on the cars. In order to maintain a proper check tickets were printed and given to the officers for distribution among the men. Each ticket is a pass good for one ride to any member of the territorial, military or naval reserve forces in uniform upon the date endorsed thereon. Mr. Mallins states that the system has worked admirably and the tickets have not been abused.

Advices from the chief office of the London County Council Tramways are to the effect that between 1100 and 1200 men of all grades have been called upon or have volunteered since the declaration of war. These men have been temporarily replaced as far as possible by men of more than thirty-five years of age. The council has granted under certain conditions full civil pay less naval or army pay and army separation allowance to enlisted men. Owing to the large number of men joining the forces some reduction in the service of the tramways was inevitable, but the Board of Trade and police authorities sanctioned the extension of the use of the by-law as to the carrying of excess passengers in the lower saloons of the cars, which materially assisted in relieving inconvenience to the traveling public. The receipts of the lines have been well maintained, but what the ultimate effect of the war will be in this regard it is difficult to estimate. Immediately after the declaration of war the council granted free transportation to the military and naval forces, ambulance corps and red cross nurses in uniform and subsequently to special constables to and from duty.

James Dalrymple, general manager of the Glasgow Corporation Tramways, states that during the month of August the lines lost 751 men, half of which were reservists and the other half territorials. During the week of Sept. 15, the company had been endeavoring to raise a full battalion of 1100 men out of the tramway department, and by the end of the week the company expected to send off to camp about 800 men. In regard to service and receipts, Mr. Dalrymple says: "We have to a certain extent reduced our service as we have not been able to fill places of all the men on account of the insufficient time to train men for the work. We expect, however, that in about a fortnight's time the staff will be up to the full strength. The men being taken on are, of course, only temporarily engaged, and we are not so particular in regard to their fitness for the work. The revenue is keeping up to last year, as the citizens of Glasgow are going about their work as usual. The employees of the company have agreed to contribute £3,100 to the Prince of Wales' relief fund. This contribution is being spread over a period of six months, weekly amounts being deducted from wages."

Out of the staff of 1800 men of the Sheffield Tramways 200 have joined the army and navy, according to a statement from A. R. Fearnley, general manager. This shortage of men has been made up by stopping holiday leave and reducing the number of men allowed a weekly holiday. The traffic receipts have thus far shown only a slight decrease and the only limitation to the service has been the withdrawal of a few part-day cars which, even at the busiest time, do not always show a profit in working. A number of the large plants in the east end of Sheffield are working overtime so that the workmen's traffic in that direction has not shown any perceptible decrease. As regards general conditions, Mr. Fearnley concludes as follows: "There is no evidence to indicate to a stranger in Sheffield that the European war has made any difference in the ordinary business or daily life of the inhabitants."

J. M. McElroy, general manager Manchester Corporation Tramways, places the number of employees who have been called or who have volunteered for active service at 700 out of a total of 5203 employees, or 13.45 per cent. The vacancies are gradually being filled by temporary engagements. The corporation is allowing half wages to army and navy reservists and territorials during the period when they are absent from work on naval or military duties, and no employee who volunteers for active service is in a worse monetary position by reason of his enlistment. Assurance has been given to all enlisted employees that their places will be held open for them. The amount the department is now paying out in allowances to families of employees at war exceeds £400 per week. The number of families in receipt of the allowance is 566 and the amount paid to Sept. 12 was £1,261. According to Mr. McElroy, the morning and evening rush traffic in Manchester has decreased. The receipts for the last four weeks and the corresponding period for the previous year were as follows: Week ended Aug. 15, 1914, £17,938; 1913, £15,140; Aug. 22, 1914, £16,434; 1913, £18,809; Aug. 29, 1914, £15,848; 1913, £17,413; Sept. 5, 1914, £17,537; 1913, £17,925; Sept. 12, 1914, £16,747; 1913, £17,761. The figures show a drop of £1,000 in the receipts for the week ended Sept. 12 as compared to the corresponding period the year before. A relief fund is being established by the City of Manchester from contributions made by the employees of the various departments. The contribution of the tramway officials and employees averages about £100 per week, the total contributions to Sept. 12 being £300. On Aug. 31 the corporation instituted a system of collections on the tramway cars to aid this fund. The "used" ticket boxes, one of which is fixed at each end of every car, have been converted into a receptacle for coppers and notices posted in the cars. The collection is purely voluntary on the part of the passengers, but during the two weeks ended Sept. 12, £463 and £471 were collected.

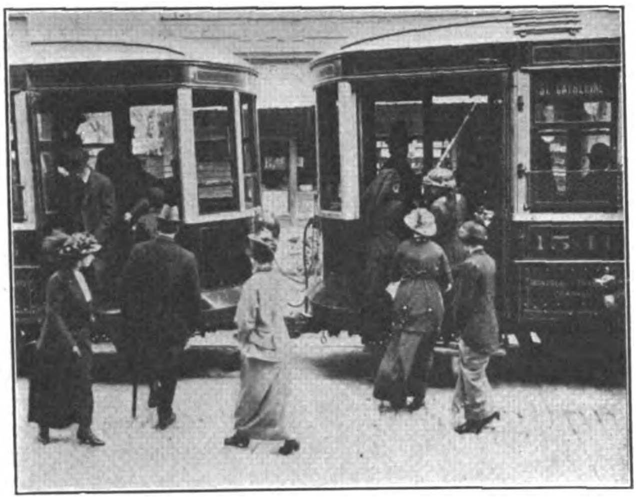
The Salford Tramways Department has already lost 198 out of its 1239 employees. G. W. Halford, general manager, explained to the representative of the ELECTRIC RAILWAY JOURNAL that the difficulty occasioned by this temporary reduction of its staff was being met by rearrangements rather than by a temporary engagement of new men who would have to give way when the old employees returned. The men who have left the service have been guaranteed re-employment, and while away will receive their usual wages, less the army pay and allowances to wives. The decrease in the number of employees have been met by stopping holidays and granting pay in lieu thereof and also by utilizing the service of the older trolley boys as temporary conductors, thus releasing a number of conductors who readily responded to the request of the general manager that they be trained as temporary motormen. The chief difficulty is in the shortage of the motormen, for it takes from three to four weeks to train men for such service. Mr. Halford states that the most marked falling off in receipts has been in regard to week-end traffic, showing that people were not taking their Saturday and Sunday afternoon outings as usual. Added to this was the fact that more than 30,000 had left the city in the last two weeks. The receipts in Salford for the five weeks ended Sept. 7, as compared to the previous year, follow: Aug. 10, 1914, £4,774; 1913, £4,949; Aug. 17, 1914, £5,179; 1913, £5,104; Aug. 24, 1914, £4,669; 1913, £5,041; Aug. 31, 1914, £4,695; 1913, £5,267; Sept. 7, 1914, £5,357; 1913, £5,603.

BRITISH SUPPLY HOUSES OPTIMISTIC

The *Tramway and Railway World* of Sept. 10 contains a digest of the opinions of electric railway manufacturers regarding the trade conditions in the British Isles. British manufacturers believe that neither home nor oversea buyers need anticipate any difficulty in having their requirements fully met, and state that orders from foreign buyers will receive the most prompt attention. The present time is looked upon as an unparalleled opportunity to British manufacturers to extend their markets on account of the cutting off of supplies from Germany, orders for which must now be cancelled. The electricity committee of Bradford has already cancelled a contract for a 5000-kw turbo-generator with the Bergmann Electricitäts-Werke A. G., Berlin. The contract has been given to the British Westinghouse Electric Company. The German generator, which was almost completed, was to cost £9,370. Many other electrical stations, municipal and private, have been forced to cancel German orders and start afresh with British firms. It is reported that one or two of the large trunk lines in England have had their supplies of German electrification material cut off.

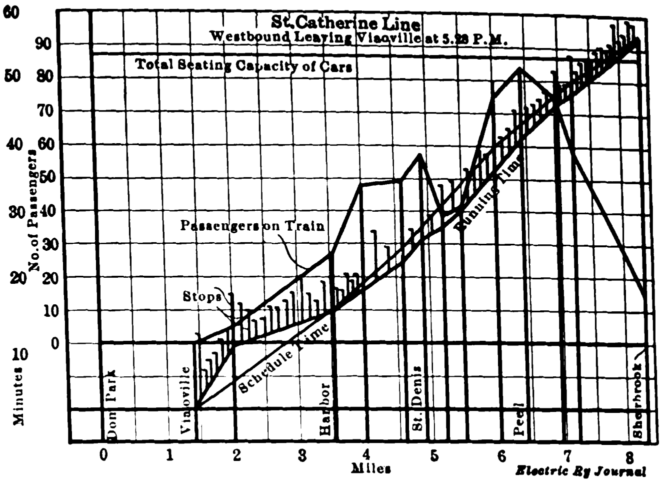
Trailer Operation on St. Catherine Street, Montreal

Since Feb. 1, 1914, the Montreal Tramways Company, operating all the electric railway lines in the Canadian metropolis, has been conducting trailer service on St. Catherine Street, the principal east and west thoroughfare of the city. Twenty-five trains are in regular operation on weekdays and Sundays for a period of eighteen hours each. The normal headway between trains is four minutes, and the route extends between Viauville and the intersection of Victoria and Sherbrooke Streets, the round trip distance being fifteen miles. Other lines serve portions of the route, branching off at various intersection points, and a single-car service on a four-minute headway alternates with the train service, the former being carried over a somewhat longer route than the latter. The frequency of service afforded on the greater part of St. Catherine Street has tended, heretofore, to withhold from the trains a patronage which would test their capacity to the limit over a long period, but the public has correspondingly benefited by the increased amount of service accommodations rendered.

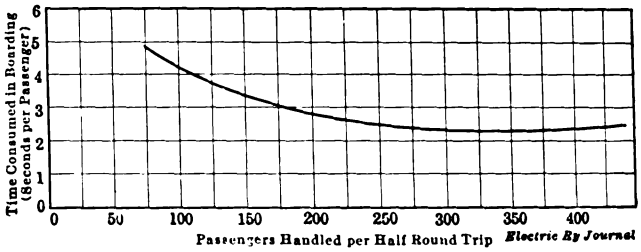


MONTREAL TRAILERS—BOARDING AND ALIGHTING PASSENGERS AT NORMALLY CONGESTED POINT

Each train consists of a double-truck motor car hauling a double-truck trailer, the cars being 42 ft. 6 in. long. The motor equipment consists of four Westinghouse No. 533 commutating-pole motors, rated at 50 hp each. The motor car seats forty-two passengers and the trailers forty-eight. Both of these cars have been fully described in previous issues of this journal. They are designed for single-end operation, with folding steps and doors, the latter being 26 in. wide between posts. Simultaneous entrances and exits are easily made at the middle doors of the trains, and, as shown in one of the accompanying cuts, the duration of stop per passenger boarding, deduced from 117 trips, has a minimum value of 2.3 seconds. With a low volume of traffic the time per passenger rises to a maximum of about five seconds, but between the limits of 225 and 450 passengers boarding per half round trip little change occurs in the unit time.



MONTREAL TRAILERS—TYPICAL DIAGRAM USED TO RECORD TEST RESULTS



MONTREAL TRAILERS—AVERAGE BOARDING TIME FOR PASSENGERS

A large number of observations have been made by the company upon the performance of these trains, including comparisons with single car service, and the results have been plotted on diagrams. These diagrams record the running time between streets, passengers on the train, schedule time, length and location of stops, seating capacity and other data.

A summary of various tests with these trains is shown in the accompanying table in which trips at different times of day are recorded under four classifications. The company's officials feel that too few so-called 6 p. m. trips were observed to make the average data tabulated conclusive, but those that are given indicate that the schedules are on the whole closely maintained. Throughout the entire day the stops average close to eight per mile, and it appears easily possible for these trains to make schedule speed, including stops, of 7.5 m.p.h., even in the most congested district of the city, and for half trips there is every indication that a maximum schedule speed of 9 m.p.h. could be maintained throughout the greater part of the day. The local ordinances, however, limit this speed to 8 m.p.h.

TWO-CAR TRAIN OPERATION ON ST. CATHERINE SHORT LINE. AVERAGE RESULTS, MARCH 2-25, 1914

	Eastbound							Westbound						
	Number of Trips	Number of Stops	Passengers Handled	Time of Stop, Seconds	Time at Rest, Minutes	Running Time, Minutes	Schedule Time, Minutes	Number of Trips	Number of Stops	Passengers Handled	Time of Stop, Seconds	Time at Rest, Minutes	Running Time, Minutes	Schedule Time, Minutes

General Averages:	Eastbound	Westbound
Number of stops	56	55
Distance between stops	652 ft.	653 ft.
Stops per mile	8.1	8.1
Distance between stop signs	410 ft.	418 ft.
Stop signs per mile	12.9	12.7

On the trains the starting signal is given to the train motorman by a signal lamp housed in a small case in front of his position, the closing of the doors completing the circuit. Energy is supplied for this purpose from the trolley lead, through an appropriate resistance, and an extra lamp is provided in case the first burns out at any time. The trains are also equipped with emergency valves controlled by ¼-in. pins mounted on the radius bars of the cars, to guard against splitting switches. In case the radius bar exceeds a maximum swing of 58 deg. the pin is sheared off, opening the emergency valve and applying the brakes before the car has time to damage itself. Without the use of these automatic valves and pins the swing of the radius bar beyond 65 deg. would damage the car. The cost of application is only about $2.50 per car.

Death of Captain McCulloch

Capt. Robert McCulloch, president of the United Railways of St. Louis, died at his home in that city on the morning of Sept. 28. The funeral was held on Sept. 30, and out of respect to him the electric cars on the United Railways system ceased operation for five minutes during the funeral.

CAPT. ROBERT M'CULLOCH

Captain McCulloch was in excellent health up to the day before he died. He was at his desk all of Saturday, Sept. 26, and when he retired that evening gave no intimation that he was not entirely well. He was found unconscious the next morning and passed away about twenty-four hours later. The cause was cerebral hemorrhage.

Captain McCulloch had been connected with the street railway interests in St. Louis practically continuously for the past forty years. He was born in Osceola, Mo., Sept. 15, 1841. At the age of five years he became an orphan and then went to live with a cousin whose home was near Lexington, Va. He was in the military school at Lexington at the time of the outbreak of the Civil War, and, with practically all of the other students in that academy, enlisted in the Confederate service. Because of his training he was appointed an adjutant and two years later was promoted to be captain. He was wounded five times, twice in the Battle of Gettysburg, where he was left for dead on the field, but was captured by the federal troops and nursed to life. He remained a prisoner for one year but was then exchanged, rejoined the army and served under General Lee until the surrender at Appomattox. He revisited Gettysburg at the time of the fiftieth anniversary of that battle a little more than a year ago. On his return he wrote a most interesting description of the battle, which was read in St. Louis at a meeting of the City Club, where he was the guest of honor.

At the close of the Civil War, Captain McCulloch returned to Missouri and in the early seventies was appointed superintendent of the Bellefontaine Street Railway, of which his cousin, Colonel Shackleford, was one of the principal owners. When a number of St. Louis railways were merged in 1899 Captain McCulloch was made general manager of the system and remained at its head until all of the railways in the city were consolidated into the present United Railways System. For a period in 1901-1904 he was general manager of the Chicago City Railway, which was controlled by the same syndicate which owned the lines in St. Louis, but he returned to St. Louis just before the World's Fair in that city and was placed in active control of the St. Louis lines with the title of vice-president and general manager. A short time later he was made president and general manager, a position which he has held actively until the day of his death. Captain McCulloch always took a keen interest in the affairs of the American Street Railway Association and its successors and was president of the association in 1896-1897.

Captain McCulloch abhorred red tape in the conduct of his business. His office was always accessible to those who had business to conduct there. Its style of furnishing was simple, and even the word "president" was not painted on the door. He kept in close touch with all of the phases of the work but his interest was in the welfare of the employees. Virtually his last official act was to approve a plan for the organization of a building and loan association, of which the stockholders were to be confined exclusively to the employees on the system, and by this plan he hoped that many of the employees would be able to own their own homes. The editorials in the daily papers of St. Louis and the expressions of opinion by representative citizens of that city following his death show the high esteem in which Captain McCulloch was held by all classes.

National Conference on Taxation

The eighth annual conference on taxation in Denver, Colo., on Sept. 8 to 11 was attended by representatives of state commissions, economists and citizens from thirty-eight states and the District of Columbia. The subjects discussed that were of most interest to electric railways dealt with the taxation of foreign corporations and securities, the federal income tax law and public expenditures.

J. F. Zoller, tax attorney of the General Electric Company, gave an exhaustive account of the discrimination and special treatment shown to foreign corporations in the revenue legislation of the various states. His main complaint was directed against the confusion caused by the imposition of a tax upon the entire authorized capital stock regardless of the issued stock and of the capital stock employed in the particular state. Mr. Zoller believed that property should be taxed once where located whether by property tax or by franchise tax, that the latter should be levied only upon the capital employed in the state and that shares in the hands of the holders should be exempted. W. Hastings Lyon, counsel to committees of the Investment Bankers' Association of America, stated that a tax on mortgages or securities should be paid to the community of residence of the owners. According to Mr. Lyon, the taxation of bonds without the taxation of stock in the hands of its owners tends to force investments in equities and is unfair to the citizens of a state, and to tax a stockholder is no more double taxation than to tax a bond holder.

A. C. Rearick, counsel to the committee of railroad counsel on the federal income tax law, criticised the ambiguity and contradictions in the law and particularly the complications arising from the plan of collection at the source. These occur in connection with the obligations of corporations payable to bearer and even more so with the obligations containing the "tax free" clause. The effect of the plan of collection at the source, Mr. Rearick believed, should be abandoned and the tax based upon a personal return of the tax payer. The danger of evasion under this method has probably been exaggerated and at any rate could be avoided by securing information at the source. Luther F. Steer, deputy commissioner of internal revenue, described in detail various administrative problems of the income tax law. Charles A. Bullock, professor of economics, Harvard University, gave a comprehensive inquiry into the disadvantages of the collection-at-the-source method.

One of the most interesting subjects of discussion before the convention was the report of the committee on the increase in public expenditures. The substance of this was that enormous savings may be accomplished within the limits of government as now organized and that further extensions of governmental activities should for some time be financed out of savings. To this end it was recommended that the National Tax Association adopt a resolution urging Congress and state legislatures to direct the annual publication of statistics regarding expenditures, taxation, public debt and wealth for the various governmental units. Furthermore, the national and state governments should establish bureaus of efficiency to ascertain where economies might be introduced, and to make such bureaus effective the government should be simplified through the introduction of the short ballot, a single legislative chamber, a reduction in the number of elective executive officers, a closer relationship between the legislative and executive departments and a fiscal budget. To get such movements under way the committee recommended the resumption of the work by the National Tax Association or the organization of a national taxpayers' efficiency association.

The report of the committee on double taxation was to the effect that interstate comity can be established only by mutual agreement among the states as to what classes of property have a taxable situs in each. The above mentioned papers and reports, as well as others delivered at the conference, will be printed in the proceedings of the National Tax Association, to be issued prior to Jan. 1, 1915. The sale of this volume to nonmembers and the details of membership are in charge of the treasurer, A. E. Holcomb, 15 Dey Street, New York.

Record Storm in Kansas City

The section extending along the Southwest Boulevard from Bell's Hill in Rosedale to Twenty-fourth Street in Kansas City, Mo., a distance of about 1 mile, was visited on Sept. 7 by the worst rainstorm in the history of that city. At some points the flood reached a depth of 10 ft. in a period of two hours. A portion of the Kansas City Railway's Southwest Boulevard Division was out of service for a short time and damage was done to other lines in the city.

The deluge was so sudden that before the workers at the carhouses, officials and trainmen who had been called at the first indication of danger had completed their work of rescuing cars they were obliged to swim several blocks to places of safety. Fortunately only six out of a total of thirty-six cars in the carhouse were put out of commission, and these had their armatures soaked; loss of much property and office equipment was experienced, however, and at one time the water reached a level of 11 ft. in the carhouse offices. The men on duty managed to save the records and papers by placing them on the top of the cashier's cage out of reach of the water. At five o'clock on the morning of the storm the flooded district extended for a mile along the right-of-way with the carhouse as a center and was nearly three-quarters of a mile wide. At no time during the fifteen hours that the tracks were under water was the line entirely out of commission; regular schedule service was continued east and north of the flooded section and a fair service was rendered from the west line of the flood to the terminal. At six o'clock the water had receded to an extent which made it possible to clear the tracks of a large amount of wreckage and débris panying illustration, and forty-five minutes later the entire line was in operation.

KANSAS CITY FLOOD—FURNITURE SAVED FROM OFFICE OF SOUTHWEST BOULEVARD DIVISION

KANSAS CITY FLOOD—WRECKAGE OPPOSITE SOUTHWEST BOULEVARD CARHOUSE

The company's asphalt repair plant, which is located in the rear of the Boulevard carhouses, was greatly damaged, as were the supplies for the plant which were stacked near by. Several other lines of the system were also badly affected by the cloudburst. In addition to this all the basements of the substations were filled with water. The loss to the company is said to be about $50,000.

Advancement of American Commerce

Secretary of Commerce Redfield has appointed seven commercial attachés who will be connected with various United States embassies and legations and who will devote their time solely to the advancement of American commerce. They are as follows: C. W. A. Veditz, of Philadelphia, to be at Paris; Lincoln Hutchinson, University of California, at Rio de Janeiro; Julian H. Arnold, now consul-general at Hong Kong, at Pekin; Irvin W. Thompson, of North Carolina, at Berlin; Albert Hale, of Indiana, at Buenos Aires; A. H. Baldwin, former chief of the Bureau of Foreign and Domestic Commerce, at London, and A. I. Harrington, of Ohio, at Lima, Peru.

The National Association of Manufacturers announces that President Yuan Shih Kai of China has asked it to nominate a commercial adviser to the Chinese Republic. At a proposed meeting in October the Foreign Trade Commission of the association will present a tentative agreement which it has made with the Chinese Republic for closer trade relations.

COMMUNICATIONS

Insert Special Work Failures

MONTREAL TRAMWAYS COMPANY
MONTREAL, P. Q., Sept. 22, 1914.

To the Editors:

The article in the ELECTRIC RAILWAY JOURNAL of Sept. 19, on "Insert Special Work Failures" is worthy of thorough consideration by both engineers and manufacturers. Improper installation, improper spacing of ties, improper design of tie layout even with the use of special ties, causing non-uniformity of tamping and thus resulting in undue stress on the castings, no doubt contribute their portions to failure of any special work. But the track engineers of many of the larger companies have in recent years become specialists in the installation of special work, and are giving more and more attention to the details of installation. Particularly the foundation, as a contributing cause of failure, is much less of an offender than is generally supposed. The managements of the larger companies, realizing that practically one-third of the cost of the entire property is invested in track work and a large percentage of this in special work, are now interested in obtaining the best design and workmanship, hence large costs are not thought extravagant in this particular part of track work.

As to lax maintenance, your statement is more or less true. The life of most insert work, if failure becomes slightly apparent and is taken in time, can be much prolonged by slight repairs. But with properties having 600 to 1000 special-work layouts, and where after several years of service a large number of inserts need attention, the maintenance at low cost is quite a problem. That fastening of inserts which is simplest of adjustment is the least expensive to maintain and the most practicable. In my opinion, this character of fastening should be the accessible bolted type that can be adjusted without removing adjacent pavement, and which rests partly on a machined bed and partly on spelter. This would eliminate what you term "experts" to maintain them, except in unusual cases. Moreover, this duty may be detailed to the section men under whose daily inspection the layouts come.

In my experience the most common failure in insert work is the loose center. The breaking or loosening of arms in the cast-iron-bound type has been rare, and due mostly to the fact that the iron binding is not carried far enough along the rail arms. Usually some allowance must also be made for unequal bearing on the foundations,. this being a mechanical possibility in manufacture, and not due to foundation installation.

The flange bearing approach to the intersection of the gage lines is not long enough in most special work. Unless a much larger plate is provided, which very materially increases the cost of the casting, this cannot be had. As a rule no specific length of incline is required, this being left largely to the manufacturer. The throatway should also have a long guiding taper to enable flanges to enter the narrow portion gradually, as the side thrust from this source tends to disturb the plate as much as impact. This also would involve larger plates. In my opinion the floor of the throatway should be as nearly as possible the depth of the flange. While it is desirable to have the intersection of the gage lines entirely flange ridden, this is impossible to maintain, but the simultaneous bearing of the tread and flange, which we always have after some wear, tends very materially to reduce the impact. The practice of allowing inserts to become quite loose before adjustment is very bad. In insert work it is very important to make the "stitch in time," hence preference for simplicity and accessibility of fastening.

I do not agree with your statement relative to the use of the 9-in. rail, even in case of the operation of interurban cars. I believe that a 7-in. rail, either T or girder type, answers the requirements of our heaviest traffic, and the increased cost of the high-rail special work is very considerable. The tendency at the present time is to use shallower and smaller blocks for paving purposes, which, in my opinion, eliminates the necessity of any higher class of construction than 7-in. rail provides.

Next to loose centers, the most serious failure is cupping adjacent to the insert. This, I believe, can be overcome partially by making a larger plate, longer runoff and long tapering throatway and by special care by the manufacturer in casting. The use of small hand grinders or hand files in maintenance to remove the cause of this difficulty has been very effective. The use of grinders either in solid or insert work is, in my opinion, a vital necessity and particularly to delay the cupping difficulty until more reasonable life is had.

As a rule, manufacturers are quite willing to make good any cases of loose or broken arms, unless caused by rough handling in yards. They will also adjust centers when they become loose in an unreasonably short time, particularly when the company has no facilities for adjusting the more complex fastenings of inserts. To meet this latter difficulty, however, I again advocate simplicity and accessibility, as the best of fastenings become loose. W. F. GRAVES, Chief Engineer.

NEW YORK STATE RAILWAYS
ROCHESTER, N. Y., Sept. 29, 1914.

To the Editors:

Your article in the issues of Sept. 19 and 26 regarding special-work failures is most interesting and instructive. The idea of sending a competent man over such a territory for the purpose of getting this valuable data is most commendable and is only another illustration of the value of a technical periodical.

There is one matter, however, as regards the life and wear of the special work, particularly the hard centers or insert, which seems to have been overlooked and this is the effect of the narrow tread of the wheels. In a case of a right-angle crossing the bearing area is directly increased as the tread of the wheel is increased so that the blow struck by the wheel as it jumps the gap or flangeway (assuming that there were no flange contact) would be distributed over a larger area in case of a wide tread than with the narrow one.

The wide-tread wheel also has a distinct advantage in the acute-angle frogs, inasmuch as it decreases, and in some cases will eliminate, the flange bearing and gives a tread bearing across the flangeway at the frog point. This it would seem is a matter which could be well taken up by a joint committee of the American Electric Railway Association as it affects the mechanical, as well as the maintenance of way, department. The increase in the width of the wheel tread would affect the weight of the car and probably some other details of its construction, but it would certainly increase the life of the special work. There ought to be, and is, some width of wheel which would be most economical, taking all things into consideration.

Your criticism of the maintenance of way departments in regard to the matter of maintaining a foundation for special work is certainly to be commended. Too many of us are in the habit of forgetting our special work because it looks so well after we have installed it. A point, however, not mentioned in your article is "how to obtain a good foundation," and for the sake of bringing out some comment on this matter I would suggest as a proper foundation for special work good, hard-wood, sawed ties, a 6-in. bed of crushed stone ballast laid on a sub-grade properly sloped to drain toward a 6-in. tile sub-drain laid from 24 in. to 30 in. below the top of the rail and properly connected to the sewer.

The use of special wooden ties for special work may be objected to by some engineers on the ground that they are difficult to remove or tamp when the special work is renewed. This applies particularly when individual repair pieces are to be installed. There are, however, undoubtedly places where special ties may be used to good advantage.

Any concrete which must be put in on account of the pavement should be between the ties or above them, depending on the type of pavement, and should be made as thin and weak as it is possible to make it and still maintain the pavement properly. This, it seems to me, is a very important point as it will enable the maintenance gangs to tamp up the ties under the special work when it becomes loose instead of putting in shims as is frequently done.

The type of foundation here suggested is a construction which can be more easily maintained, and in addition to this will furnish a resilient base for the special work. That this resilience is desirable is illustrated by the fact that the blacksmith invariably places his anvil on a wooden block in order to absorb the shock, instead of placing it on a stone or concrete pedestal. This resilience of the foundation should absorb the shock and thus relieve the pound and the tendency to cup at the centers. The tendency with this type of foundation would be to increase the life of the special work and, as above stated, make it more maintainable.

With regard to the different methods of holding the insert plates, as described in your article, it would seem that the study and observations which have been made in preparing this article should be given considerable weight, as an inspection of a large variety of work of this kind would, in the general, give average conditions.

The functions of the holding device should be, first, to make the insert plate act as a unit with the remainder of the piece in distributing the load and impact to the foundation, and, second, to make the insert plate renewable. This second feature of the design of the holding device may be objected to by the manufacturers on the grounds that the hard centers should last during the life of the piece. There are, however, enough instances in which the insert plate does not last to make this feature of the design desirable. From the report of the inspection it would seem that all of the different types of hard centers have failed in some instances and that some of each of the different types have remained tight, indicating that there are certain conditions which make all of the designs practical, although those conditions may be difficult to obtain at all times.

While my experience and observations as regards the loosening of centers is somewhat limited, it would seem to me in general, with some noticeable exceptions, that the larger sizes of insert plates do not loosen as readily as the smaller ones, regardless of the type of fastening, and this brings us to another matter in the design of special work which should be given consideration, that is, the shape and detail design of the insert.

A great deal has been written regarding the joint between the insert plate and the head of the running rail. The general conclusions are, I think, that a beveled or mitered joint of some nature gives better results than a straight joint at right angles to the direction of the wheel movement. This joint is not the only matter of importance, as the bevel on the riser for the flange bearing, and the length of the flange bearing are important. This is particularly true when different types of wheels are operated over the same track. For instance, a case which has recently come to my attention is one in which the riser of the hard center was so designed as to take care of the wheels on city cars properly, whereas the flange on the interurban wheels which operated over this same track was such as to throw the weight of the car on the flange at the edge of the insert in approaching the frog point. This flange bearing was carried through to a point so that the tread bearing was again obtained only after the wheel had left the insert plate with a resulting tendency to cup the head of the rail just beyond the insert. The manufacturer's attention was called to this matter and in later designs the difficulty was eliminated by the lengthening of the insert.

This again brings out a matter which is frequently overlooked by the engineers or purchasing agents in regard to the purchasing of special work, namely, that the manufacturers should be given all of the data necessary to properly design the special work. This includes information as to the type of wheel and the great many other data which are frequently not furnished with the specifications for special work. The manufacturers are only too willing to help us solve our problems and they should be given every opportunity by being furnished with data necessary for an intelligent design.

The engineer comes in again for criticism in regard to the selection of the type of special work to be used. This criticism is probably justified, although there are times when, on account of questions of finance or emergency conditions, he is obliged to use materials which he knows are not the ones best suited for conditions under which they are to be used.

Your second article as regards the different examples of failures is most interesting, though the majority of the illustrations can be duplicated in most of our larger cities. With reference to the maintaining and repairing of such special work there are a great many details which can be developed to good advantage. For instance, in the case shown in Fig. 3, this layout can be put in very good condition by resetting the hard centers or by installing new ones to the level of the rail and filling the cupped ends of the running rail by means of a welding outfit so that the whole can be reground.

The suggestion of having special work frequently inspected and maintained by a special gang is a very good one, and with care in selecting the men so as to obtain those who are interested in this type of work a great deal of money can be saved. D. P. FALCONER,

Engineer Maintenance of Way.

In Support of the Flagging Rule

NEW YORK, Sept. 25, 1914.

To the Editors:

The editorial "Proceed Protected by Flag—a Fallacy" in your issue of Aug. 1 has been read by me with interest as well as with regret that it has not occasioned as much discussion as the subject merits. I cannot agree with your views, nor indeed with those of some of your correspondents, for I am of the opinion that a rule permitting a train in an emergency to flag to a point of communication is requisite to the maintenance of regularity of service.

Hostility to a rule under which a train, delayed by the adverse indication of a block signal or other cause, may flag to the next available telephone station in the event of interrupted communication from the point of delay is predicated on the probable incompetence or carelessness of the flagman. But since the flagman who is preceding the train is always within sight and under the direction of the motorman, it is within the power of such motorman to keep a safe and proper distance in the rear of his flag.

The old rule which allowed a train to "Proceed under control within half the range of vision" was suited only to a city street railway, and had no rightful place in the code of a high-speed interurban line. Its elimination marked a long step toward "safety first." However, the right to move under flag protection is recognized by Rule 99 and by the rule (I do not recall the number) which provides that whenever it is necessary to back the train it must be done under the protection of a flag. In addition, the practice of flagging is in accordance with the rules of the American Railway Association and is considered by it a safe and proper movement.

Although the rules governing the operation of automatic block signals primarily state that, unless otherwise provided, those signals do not affect the movement of trains under the time-table or train rules, a train halted by a stop signal at the entrance to a block could not proceed on its time-table rights. This is on the assumption that, since no superior train is due, the signal must be disarranged, as has been suggested by one of your correspondents; therefore, the stop signal effectually forbids any further movement until the signal is cleared or the train released by an order.

Under the system of operation which obtains on most interurban roads, such indefinite delay to a regular train by a defective signal would demoralize the service, as with positive meeting points every train affected by the delayed train would remain at a standstill until the signal cleared or telephone service was restored. But if the right to proceed "under the protection of a flag" was accorded, the delayed train would soon release the opposing train at the regular meeting point.

F. A. BOUTELLE.

Economic Limits of Passenger Haul

CHICAGO, ILL., Sept. 24, 1914.

To the Editors:

My attention has been directed to the discussion of the Boston fare zone question in a recent issue of the ELECTRIC RAILWAY JOURNAL. Your brief editorial comments, together with the recent joint commission's report have been of such great interest to me that I venture to attempt some further discussion of this complex subject, based upon several years of observation in this particular field of transportation. At the outset I am quite aware of the widest divergence of opinion among railway men and other students of the problem. Therefore I shall only attempt to eliminate, if possible, some of the variables and to draw the lines of discussion perhaps a little closer though upon broader ground.

Fundamentally, there are two entirely different points of view from which this subject must be discussed, viz.: whether the economic limits of haul are being considered for:

1. An individual line, regardless of the earning capacity and traffic characteristics of the remainder of the system, or
2. A completely unified system with universal transfers, wherein the net results of the system as a whole are the determining factor.

If the latter, then existing irregularities in the boundary of the five-cent zone, due to topographical or other equally logical reasons, are of lesser direct interest than the average passenger haul and the average radius of car operation within the five-cent zone. This average haul, I take it, is in reality the ultimate subject of the joint commission's inquiry and I am quite in accord with this viewpoint for the general purpose of defining the economic limits of average revenue haul. (This restatement of the subject, it seems to me, is much less liable to misconception than "maximum length of profitable haul" which distinctly pertains to the other viewpoint, i. e., to the maximum haul of an individual line.)

Even casual study of the development of our American cities shows the practical impossibility of applying an inflexibile economic measuring stick to individual lines. The hill contours, water courses, street plan, railroad, factory and park locations, competitive steam suburban service, and the modern tendencies toward restricted residential development, all exert so powerful an effect upon the shape and growth of the city that an analysis of the practical problem can hardly be predicated upon so idealistic a hypothesis as presented by a circular city with central business district, radial thoroughfares and uniform density of settlement. Consequently this discussion purposely goes further than the problem of the individual line, to which so much attention has been directed in the past, because so restricted an inquiry fails to serve the broader and ultimate purpose.

It has always seemed to me that consideration of the railway situation would be immensely clarified and reduced to more tangible form if we could accept the homely lesson of the churn and be content with a reasonable proportion of cream and milk, of fat and lean, of short haul and long haul. That is to say, except in some special problems (outside of the scope of this discussion), the economic problem of passenger haul is in the last analysis broadly associated with four principal factors: 1, Total operating revenue; 2, operating ratio; 3, fixed charges, and 4, routing and traffic characteristics. And it is to the last that I particularly desire to address myself.

Contrast, if you please, two widely diverse plans of route operation in a city with centrally located business district. First, by through routes; second, by loop routes terminating in the business district. The former, as developed in progressive cities, have clearly resulted in the maximum encouragement of multiple riding, which may become so pronounced that a route 10 miles or more in length will show earnings per car mile much in excess of normal. On the other hand, the latter or terminal loop system, with only half the length of car haul, unquestionably curtails multiple riding to the minimum especially in the central business districts. While it would be possible in practice to split the earnings of a through route arbitrarily at the axes of the principal delivery district (if one exists) and thus, for the purpose of investigation, to merge the operations of through and loop routes as regards average haul from the business centers, this would fall short of being an exact method. It is therefore to be emphasized that the method used in the Boston inquiry strictly applies only to systems operated with a radial system of downtown terminal loop routes, and with no inter-line traffic (the full effect of which would only appear as such in a through-routed system), unless the assumptions made are based upon sufficiently accurate knowledge of the average route characteristics.

Now, this matter of multiple riding obviously affects most seriously any assumption of average ride in per cent of car haul or one-way trip, and in view of the well-known extreme variations in this so-called "trip factor" one is hardly justified in even hazarding a guess, in the absence of essential traffic records, for the purpose of drawing comparisons between systems. Then the principle of "short-line" operation, which is being

---

This report defines the maximum distance that it is economically feasible to transport passengers *on the average* (long and short haul included), to be 4.28 miles for a 5-cent fare (exclusive of depreciation), based upon an average return on securities of 5.18 per cent; or 4.03 miles with an average return of 7 per cent. The fundamental assumption is made that the average passenger (including his transfer), rides two-thirds of the full one-way car trip.

so generally accepted by railway men (and properly so as a scientific means of proportioning service to travel), further invalidates any other than a very general assumption of the basic "trip-factor," for the average ride on short lines is in most cases relatively longer than on lines running through. And finally the enormous variation in transfer traffic certainly has great bearing upon such an assumed "trip factor." Thus 70 per cent of the Chicago fare passengers transfer in order to complete their ride on other lines; in Pittsburgh only 18 per cent transfer.

In the Boston inquiry it was assumed that the average passenger (including transfer) rides two-thirds of the one-way car trip, a distance of 2.86 miles. From this basis an average profitable haul of 4.25 miles was derived, which is practically equal to the actual length of the average car haul, 4.28 miles, as stated. Even though a coincidence, are we to infer that the average passenger could ride 50 per cent further, i.e. through to the outer terminal (if such a condition could exist), without occasioning loss to the company, or else that an equivalent margin of surplus profit exists in the operation of the property? I think not. In Chicago the average car haul is nearly 5 miles one way; in Pittsburgh but slightly less. This economic equilibrium would certainly be absent in these two cases if such a long average haul actually took place. It may be pertinent to cite the fact that the average haul per revenue passenger has been found to be as low as 2.4 miles in San Francisco, 2.5 in Providence, with a large proportion of through routes; 2.7 in Philadelphia, with long car hauls, and, I understand, a little under 3 miles in Pittsburgh with car hauls of 7 miles and over.

And should not this comparatively short actual ride set at rest the fears held by many railway men as to the question of maximum possible ride for a single fare? Obviously no company could afford to transport all passengers 26 miles for 5 cents, the possible ride in Chicago, nor to permit them to transfer around a given circuit *ad infinitum*. The answer drawn from the annual income account seems to be that in most cities such riding is relatively quite negligible and confined to persons of inquisitive and adventurous disposition. Obviously, the average ride is the economic criterion, and the fact that these long routes are often the largest earners positively reflects the multiple riding that must have taken place. Why then the extreme uneasiness and the citation of these possible long hauls as prima facia evidence of the necessity for increase in fares (or curtailment of fare zones), reduction in service, or both? This will be automatically regulated by the law of possibilities; for the fare zone is akin to a rubber band stretched outward by the pressure of public demand into various irregular contours and contracted quite as vigorously by the necessity of an adequate return on the investment until equilibrium is finally achieved.

Does it not seem more logical, in view of the indeterminate nature of many of the factors in the problem of estimating average profitable haul, that every effort should first be made to ascertain by actual traffic surveys the true characteristics and riding habit on transit lines? Such studies are highly illuminating, and invaluable in any specific determination of service requirements. Such methods are not "academic" or "theoretical"—they are intensely practical. Many progressive companies have traffic bureaus especially established for the prosecution of these studies. With the average haul and riding characteristics thus determined throughout the system and the ultimate financial returns known, all of the elements are available for computing the gross margin of expansion for the future on a basis that leaves little room for conjecture. And given this gross figure, it then is not a difficult matter to allocate the economic boundaries of the 5-cent and the succeeding fare zones, whether regular in form or greatly distorted by reason of purely local conditions. Assuming reasonably efficient operation, the gross income is the key to the situation and, in the broader sense, the economic fare limits are to be extended or contracted according as the property as a whole shows a return on the investment above or below normal. This broad conception is evidently at the bottom of the Boston commission's findings, but they were distinctly handicapped by the absence of complete operating data as so stated.

The annual financial results thus tell the story. Why pursue nimble-footed figures to the end that some particular line may be found too long or too short? Why should not the fare zone limits as a whole constitute one of the flexible elements of the economic structure of rates and service? The income will support a certain service mileage per year. That agreed to, it is not a matter of vital concern to the operating companies whether the municipal authorities prefer to fix an adequate fare and warp the magic cordon here and there or to fix the boundaries of city fare for the time being and then adopt a flexible fare securely bulwarked (let us hope) against the premise of an adequate return upon a fair investment. It is only necessary to agree upon the fundamentals. The latter is perhaps best adapted for frequent economic adjustments to meet current operating conditions, but the former plan has undoubted merit in facilitating the welding together of a city and its tributary suburbs into one homogeneous community. After all, arbitrary political boundaries *per se* have little influence upon the broad movements of urban population, and the imposition of such artificial restraints within an otherwise compact community can only result in distorted settlement and restricted internal development.

I trust that this communication will be construed only as an attempt to direct attention to some of the broader phases of the fare zone question and not primarily as a criticism of methods heretofore pursued. Unfortunately, surveys of traffic condition have been few and far between. But however difficult and costly, there appears to be no other source of positive information necessary to adjust the delicate questions of fares and service which are constantly arising in the electric railway field.

J. R. BIBBINS, Engineer.

Virginia State Corporation Commission Report

The State Corporation Commission of Virginia has issued an appendix to its eleventh annual report for the year ended Dec. 31, 1913. The book contains the reports and statistics of canals, railroads, electric railways and other corporations for the fiscal year ended June 30, 1913. Individual reports are presented for each electric railway, giving the history of the company, its directors and officers, and data concerning the mileage, capitalization and operating results. In addition there are statistical tables showing the combined figures along these lines for all the companies. The total electric railway mileage operated in Virginia as of June 30, 1913, was 639.98 miles. The total common stock authorized was $85,320,000; outstanding, $31,795,600; preferred, authorized, $24,225,000; outstanding, $10,995,000. The funded debt authorized was $78,950,580 and outstanding, $44,752,180. The total operating revenue amounted to $5,564,679 and the operating expenses $3,360,629. The report also contains a list of railroad corporations not yet engaged in business with statistical tables showing the date of the charter, the amount of capital authorized and paid in, the expenditures already made and proposed routes and terminals.

ASSOCIATION NEWS

MILWAUKEE COMPANY SECTION MEETING

The first meeting of the Milwaukee Electric Railway & Light Company Section, A. E. R. A., was held on Sept. 10 with an attendance of 110. This attendance was considered very satisfactory in view of the unpleasant weather. The program comprised, in addition to the election of a delegate to the Atlantic City convention and other business matters, a paper on courtesy by H. F. Scheife, a short address by J. P. Shaw, general counsel for the company, an exhibition of lantern slides on the European war and several musical numbers.

In his paper on courtesy, Mr. Scheife pointed out how an employee thus fortified is ever an asset to a company. Motormen, conductors and clerks are the principal employees through whom friends can be made for their employers. A car crew is often the choice of disgruntled passengers for the venting of their wrath. With courtesy the conductor or motorman can combat the assailant without difficulty. The speaker dwelt upon the telephone as a means for developing either a hostile or a friendly attitude on the part of the public, and in which courtesy can be used to good purpose. Mr. Shaw showed the influence of little acts of discourtesy upon the operation of the legal department. The attorney in defending the public service corporation in court must argue his case before the twelve "tried and true men" forming the jury, chosen from the public. Unkind treatment on the street cars, a snub by a meter reader, an impudent reply over the telephone accorded one or more of those twelve men prejudices those individuals and may stand in the way of a verdict in favor of the company.

The secretary of the Milwaukee Section for the current year is Harry G. Abendroth.

NEW COMPANY SECTION IN MANILA

Word has just been received of the formation of a company section by the Manila Electric Railroad & Light Company, of which C. N. Duffy is vice-president and general manager. The new section starts with eighteen members. The names of the officers have not yet reached this country. This is the fifth company section, the other four being Milwaukee Electric Railway & Light, Public Service, Denver City Tramway and Washington Railway & Electric. Other sections are in process of forming, but developments are not sufficiently advanced to warrant announcements.

COMMITTEE ON COMPANY SECTIONS AND INDIVIDUAL MEMBERSHIP

The committee on company sections and individual membership, of which L. S. Storrs, president of the Connecticut Company, is chairman, contains a sub-committee on membership at the convention, of which Martin Schreiber, engineer maintenance of way Public Service Railway, is chairman, and C. W. Stocks, statistician A. E. R. A., is secretary. The following have been requested by Mr. Schreiber to act on this committee during the convention for the purpose of securing new members for the association: Representing the American Association—H. C. Donecker, assistant general manager Public Service Railway; W. H. Sawyer, vice-president E. W. Clark & Company Management Corporation, and R. B. Stearns, vice-president Milwaukee Electric Railway & Light Company; representing the Accountants' Association—H. A. Gidney, auditor Montpelier Traction & Power Company; M. R. Boylan, general auditor Public Service Railway; and W. H. Forse, Jr., treasurer Union Traction Company of Indiana; representing the Claims Association—J. H. Handlon, claim agent United Railroads of San Francisco; T. G. Rice, Pittsburgh Railways, and G. C. Whitney, chief clerk accident department, Washington Railway & Electric Company; representing the Engineering Association—J. P. Barnes, general manager Syracuse & Suburban Railway; H. H. Adams, superintendent of equipment Chicago Surface lines, and R. C. Cram, assistant engineer Brooklyn Rapid Transit Company; representing the Manufacturers' Association—W. V. Dee, general sales manager the G. Drove Company; C. R. Ellicott, Westinghouse Traction Brake Company, and L. E. Gould, western manager the ELECTRIC RAILWAY JOURNAL; representing the Transportation and Traffic Association—W. O. Wood, president New York & Queens County Railway; J. L. Adams, division superintendent Denver City Tramways, and Bruce Cameron, superintendent United Railways of St. Louis.

It is planned to furnish each member of the committee with a receipt pad with stubs, and each will be supplied with an alphabetical list of association members. He will be prepared to explain the plan and scope of the association to prospective members, to call attention to the association pin and its significance, and to enroll as many individual members as possible. The members of the committee will be requested to report each day to the secretary.

Mr. Schreiber has also instituted a plan for interesting members of the American Railway Engineering Association in the American Electric Railway Association. A circular letter has been sent out calling attention to the advantages of membership, particularly mentioning the "Engineering Manual," and the A. E. R. A. standard specifications for rails in paved streets.

COLLEGE REUNIONS AT ATLANTIC CITY

University of Pennsylvania men who expect to attend the A. E. R. A. convention are requested to notify J. Walter Wright, roadmaster Public Service Railway, Elizabeth, N. J. Mr. Wright expects to be at Atlantic City on Thursday and Friday and will be pleased to arrange for a reunion on one of those days.

CHICAGO CONVENTION TRAIN RESERVATIONS

The convention transportation committee of Chicago has just put in the mails a handsome pamphlet announcing the various accommodations available on the Pennsylvania special which will leave Chicago at 5 p. m., Saturday, Oct. 10, and arrive in Atlantic City on Sunday at 4 p. m. This year's pamphlet is up to the standard of those issued in former years, containing twelve pages, illustrated in colored conventional and halftone designs. Already the number of reservations indicate that the Chicago convention train will carry its usual quota of delegates. Those desiring to make reservations for the Chicago-Atlantic special train may do so by addressing communications to E. K. Bixby, district passenger agent Pennsylvania Lines, 175 West Jackson Boulevard, Chicago.

The new shops of the Atlantic City & Shore Railroad has just been completed and can be inspected during the convention. The company, through its general superintendent, George F. Faber, extends an invitation to readers of the ELECTRIC RAILWAY JOURNAL to visit the shops and will provide guides to show visitors around. The new shops are at the eastern or Inlet end of the Atlantic Avenue line.

Secretary McConnaughy has opened his office on the Pier at Atlantic City and is planning to have all of the exhibits in finished form by Saturday night, Oct. 10. He has announced Hopper Smith as the official photographer of the convention.

Determining the Character of Armature Winding

BY C. W. SQUIER, E.E.

Different armature connections and the method of connecting them to the commutator are best shown by a developed view of the armature conductors, pole pieces and commutator as in the accompanying illustrations.

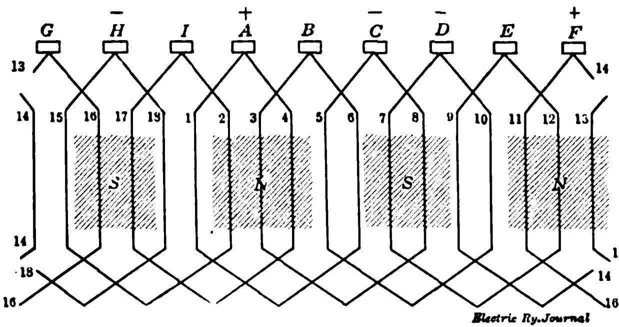

FIG. 1—DEVELOPMENT OF DRUM-WOUND ARMATURE

The small squares at the top represent commutator segments, the cross-sections are the pole pieces and the conductors are shown by the full lines.

Figs. 1 and 2 show developments of drum-wound armatures having eighteen conductors and a four-pole field. The number of conductors and the method of connecting the back end of the armatures are identical in the two illustrations, but the connections to the commutator and the method of connecting the conductors together at the commutator end of the armature are different.

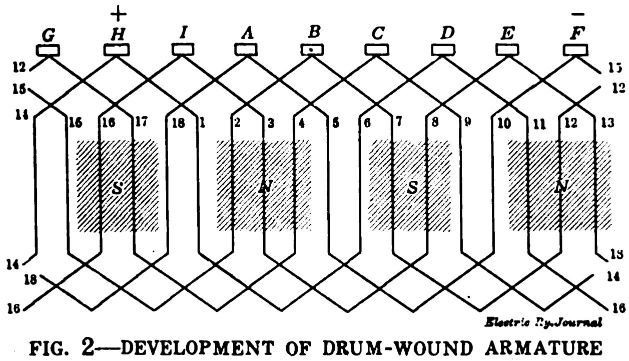

FIG. 2—DEVELOPMENT OF DRUM-WOUND ARMATURE

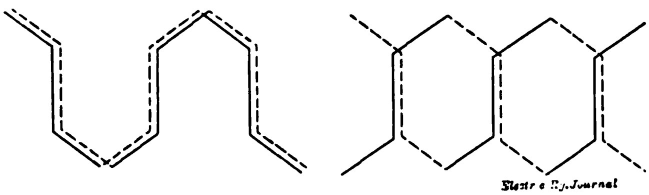


FIGS. 3 AND 4—ORDINARY AND RETROGRESSIVE WAVE WINDING

With the connections shown in Fig. 1, if we start from the commutator segment *A*, which in the position shown is the point where the current enters the armature, we find the winding as follows: *A*-1-6-*B*, *B*-3-8-*C*, *C*-5-10-*D*, etc., until it arrives at the coil *I*-17-4-*A* where it returns to the starting point. The path of the current through the armature between the two brushes is through conductors lying under adjacent north and south poles, and the winding at each turn around the armature laps back to a commutator segment adjacent to the one from which it started. On account of this fact this form of winding is usually known as "lap" winding. A lap winding requires as many brush-holders as there are poles.

Now if we trace out the winding in Fig. 2, starting at the positive brush-holder the winding is as follows: *H*-1-6-*D*, *D*-11-16-*I*, *I*-3-8-*E*, etc., until it arrives at *C*-9-14-*H*, where we return to the starting point. In this case it is seen that instead of the winding lapping back as in the previous case, it progresses in a regular manner around the armature. Such a winding is sometimes called "progressive" but more commonly, on account of its wave-like path, is called a "wave" winding. This winding requires but two brush-holders for a four-pole motor.

In these diagrams the armature conductors are represented by single lines, but it would be impracticable to wind an armature with single conductors, especially if only a few conductors were used. It is evident, however, that if each coil consisted of a number of turns and the ends of the coil were connected as shown in the diagrams the effect would be the same, as far as the armature connections are concerned. Also in order to get small coils, two or more are placed in each slot. A wave winding with two coils per slot will then take the appearance shown in Fig. 3, where the dotted lines represent the bottom coil in the slot.

Another form of "wave" winding is obtained if we merge any two pairs of similar adjacent slots, shown in Fig. 2, into one another, using but one-half the number of slots. We would then obtain a winding with two coils per slot of a form shown in Fig. 4. This type of winding is called "retrogressive wave winding" in contradistinction to the ordinary wave winding shown in Figs. 2 and 3.

Effect of Car-Wheel Diameter on Motors

BY H. J. PARKS, MASTER MECHANIC EAST ST. LOUIS & SUBURBAN RAILWAY, EAST ST. LOUIS, ILL.

Some time ago there was more or less discussion regarding the effect on the motors of variation in car-wheel diameters. Recently the East St. Louis & Suburban Railway mechanical department had this effect most forcibly demonstrated. While I believed that it was more economical to turn all wheels the same size than to save wheel metal merely by restoring the flanges, for the benefit of my inspectors I wanted an actual demonstration of the effect of different wheel diameters on the motors in a car. I knew that unless all the wheels under a car were of the same size, the motor geared to the large wheels would be doing the greater part of the work, especially in a four-motor equipment.

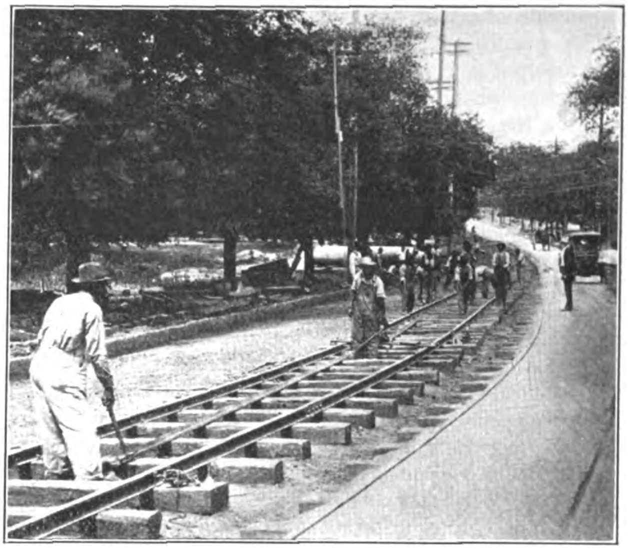
One day a car was turned into the shop with a locked armature which had resulted in two flat wheels in one truck. These flat wheels were removed and replaced by a new pair which were ¼ in. larger in diameter than the rest, and the car was again returned to service. Before four days had elapsed, the armature driving these large wheels was turned in burned out, and at the close of seven days more, or after 800 miles had been run, the second burn-out occurred. When this second instance was reported, I was satisfied that the trouble was due to the size of wheels rather than to a defective motor or overloading from any other cause. Accordingly I had the large wheels removed and turned to the same diameter as the other wheels on the car. Since that time I have had no trouble with this particular car, and in every instance of armature trouble the diameter of the wheels in four-motor equipments is checked to make sure that all are the same size. Prior to this time care had not been exercised by inspectors to see that all wheels were of the same size under each car. Hence the adherence to this rule has made it possible to reduce armature trouble in the four-motor cars in service approximately 22 per cent.

Vineville Avenue Concrete Paving, Macon, Ga.—The Job

BY CARL H. FULLER, FORMERLY ENGINEER OF WAY, MACON (GA.) RAILWAY & LIGHT COMPANY

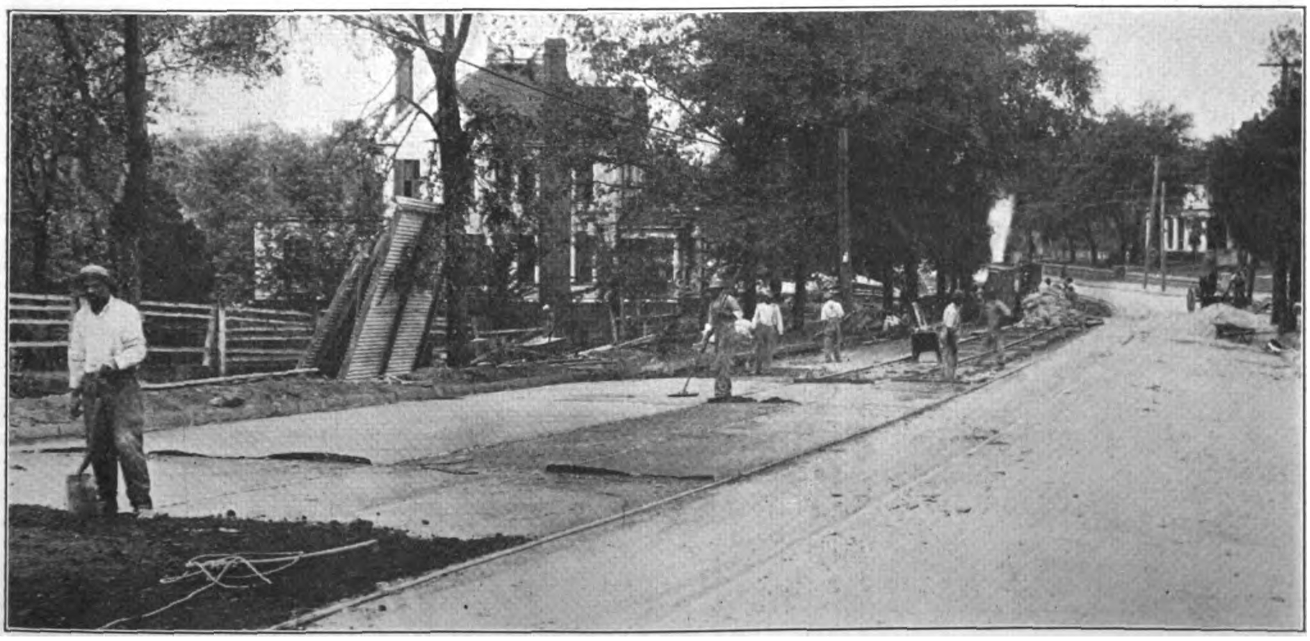
Vineville Avenue with its branching continuation of Cotton and Georgia Avenues forms the main thoroughfare from the downtown section of Macon, Ga., through the Vineville addition, to extensive and rapidly growing suburbs beyond the city limits, where it becomes a state highway connecting Macon and Atlanta. The street is paved with brick from downtown to Rogers Avenue, some 2145 ft. from the city limits, while the county road beyond the city limits is one of the finest automobile roads in the state. Consequently this highway has a very heavy team and automobile traffic. But the unpaved section from the ridge at Rogers Avenue through the intervening valley to the crest at Pinona Avenue or city limits, was rough, practically ungraded and continually gullied by the rains which followed the track rails until at times it became almost impassable; while in the dry season a constantly drifting cloud of dust, stirred up by every passing vehicle obliterated vegetation and made life unendurable in the locality.

For several years the city of Macon had been paving with brick. This brick, however, had been increasing in price, and owing to its poor quality had caused much dissatisfaction. A short time before, two blocks on another street had been paved with concrete at far less cost than the brick, its smooth clean surface meeting with instant popularity among both property owners and the traveling public. All of these facts influenced the paving of Vineville Avenue with concrete.



VINEVILLE AVENUE PAVING—ONE TRACK FINISHED WHILE MEN ARE PREPARING TO INSTALL GUARD RAIL ON OTHER TRACK

The energetic chairman of the aldermanic paving committee believing that the cost could be reduced still further by doing the work with city forces, persuaded the council to add a concrete mixer to the city's paving equipment and commissioned the engineering department to purchase the necessary paving materials. In the meantime the City Council passed an ordinance requiring the public service corporations to lay their



VINEVILLE AVENUE PAVING—PAVING GANG AT WORK, SHOWING COATING OF CLAY AND SAND TO PROTECT CONCRETE; ALSO LOCATION OF CROSS JOINTS IN PAVING INDICATED BY PROTRUDING PAPER pipes and wires and cut in services to the curb lines every 50 ft. under penalty of not being allowed to open the street for five years. The companies immediately took advantage of this ordinance and in the case of the city water works a new and larger main was laid while the telephone company proceeded to install underground service. The city engineer then established the grade, and granite curbing was placed at a cost of 25 cents for the stone, 3 cents for hauling and 3.5 cents for setting, a total of 31.5 cents per foot in place. This expense was charged directly to the property owners.

The grading was performed by the city convict or stockade gang, consisting of some twenty-five or thirty men and teams working under armed guards. Where possible the plating of the old road was broken with a breaker plow and the surplus dirt was shoveled into slat-bottom wagons and hauled to neighboring yards that happened to be below the grade. This work included the rough grading for paving, trenching out for the street railway tracks, grading for sidewalks, and in some cases terracing the front lawns of property owners, no charge being made for this work either against the paving or against the abutting property. As the stockade keeps no detailed cost of such work it is impossible even to approximate either the quantity of dirt handled or its cost.

Owing to the fact that for several years the street railway patrons had been greatly inconvenienced during paving operations by being obliged to transfer around the work, and because of the fact that Vineville Avenue was the only practicable thoroughfare through that section of Macon, it was agreed by the city authorities and the traction company to keep one side of the street open to the public while paving the other, and to avoid any transfer if possible. The interval between cars in each direction is fifteen minutes, giving seven and one-half minutes running time between meeting points, namely, Monroe Street switch on the end toward town and Pinona Avenue at the beginning of the single track leading to the country, a distance of 6500 ft.

The following plan of operations was worked out by the writer, acting for the traction company, and Col. J. J. Gilliard, engineer for the city. It gave satisfaction all around as no time arose when the company had to transfer passengers on account of paving although to accommodate the work it did transfer from car to car on parallel tracks for a few hours. The accompanying sketches marked Case 1 to Case 5 (not drawn to scale) readily show the plan followed in handling traffic and in paving operations.

Case 1—This plan shows the relative, original location of the tracks and switches from Monroe Street to Pinona Avenue. It will be noted that for some 2000 ft. along the unpaved portion of the street the two tracks lay next to the left-hand curbing, while the public service corporations and sewers occupied the right-hand side of the street. While these companies were taking care of their services prior to paving operations, the street traffic used that portion of the street occupied by the traction company's tracks.

Case 2—When the foregoing work had progressed sufficiently, the traction company hauled its material, rail and ties and constructed a new third track from a new switch beyond the city limits back to Rogers Avenue crossover, putting it in readiness for the paving. The city forces followed, fine-grading this portion of the street for final paving operations.

Case 3—When everything was in readiness to begin actual paving, the traction company cut its west-bound

track at the crossover and shifted the end to connect with the new west-bound track. The old west-bound track was then connected to the east-bound track by means of one end of the crossover, thus confining double-track operation between Rogers Avenue and the city limits. As the latter point, however, was the natural meeting point this arrangement did not interfere with the operation of cars, although the necessity for teams to use the tracks between these points sometimes delayed cars a little. The paving force then began laying concrete from the curbing to the inner rail of the new track or the rail next to the future devil strip working from the east end toward Pinona Avenue.

Case 4—When this side of the street had been finished and the eight-day restriction removed, team and car travel were diverted to the new work. This necessitated single-track operation from Monroe Street to Pinona Avenue, where the cars had to be switched while the new east-bound half of the crossover was being moved to its new location and paving laid. Then after the eight-day restrictions were removed, cars were passed on the double track between Rogers Avenue and Hardeman Avenue switch. This proved an awkward meeting point as it was more than 2000 ft. east of the normal meeting point so that west-bound cars had to wait several minutes on east-bound cars, but as this line was the longest in the city and had long stretches of double track, the cars were able to leave the terminals on time. The traction company then proceeded to remove its old double track, laying the new track with paving operations following close behind.

Case 5—This plan shows the paving complete with the tracks connected in their final locations.

VINEVILLE AVENUE PAVING—TEARING UP THE OLD DOUBLE TRACK WITH THE AID OF TRACK JACKS—NOTE UTILITY CAR IN THE BACKGROUND

The first of the three accompanying photographs was taken near the crossover, looking westward, and shows the west-bound side of the street finished and the paving gang at work on the east-bound side. To the left may be seen the coating of clay and sand which was placed to protect the concrete from the sun until it had set. The cross joints in the paving are clearly defined by the paper, protruding above the concrete, while along the curb is an expansion joint (Carey Elastite paving joint).

The second photograph was taken a little further west and shows the finished half of the street, as in the first picture, while on the left the traction company's forces are surfacing the new track. In the foreground may be seen two men preparing to attach the rolled shape guard, used on curves, to the low 60-lb. T-rail. The street at this point has been fine-graded and steam rolled ready for concrete.

The third picture shows the traction forces still further to the west tearing up the old double track, using track jacks to lift it bodily from the hardened road surface. After this the ties were detached from the rails by driving down on their ends with a "deadman" made of an old tie with track spikes for handles, and then the joints were broken loose by means of "cleaver" and hammer. This is an economical method of wrecking track and loosens the ground for the graders. In the background of this picture is shown one of the company's utility (flat) cars hauled by one of the regular bench cars for a motor. This style of equipment handled all of the track material used on this job and is fairly economical. The flat car, which is single-truck, is equipped with extra log drawbars to admit handling 33-ft. rail. This combination carries eighteen 60-lb. rails, or five tons, per trip and has to negotiate some 5 per cent grades.

Exhaust Ventilators for Railway Motors at East St. Louis

By working on the principle that if a little ventilation is good more is better, H. J. Parks, master mechanic East St. Louis & Suburban Railway, has applied exhaust ventilation to his railway motors. One 6-in. exhaust ventilator of the "Peerless" type has been installed on each motor by cutting a hole in the top inspection plate and riveting the ventilator in place. The largest size ventilator of this type that could be installed and clear the truck was purchased and in order to obtain good circulation the bottom inspection plate was drilled full of ½-in. holes. In a nineteen-hour test run with a G.E.-216 motor, it has been found that this ventilator maintains the normal maximum temperature 19 deg. lower than that in the unventilated motor. At the same time the number of rewindings has been reduced one-third, namely, from an average of three coils per car a month to two coils. Three cars were equipped with these exhaust ventilators more than a year ago and no difficulties have arisen. As a result of the economies demonstrated twelve more cars are being equipped. A peculiar yet self-evident result of this ventilating scheme has been that while dust may enter the motor housing the motors are actually much cleaner than before.

Cast-Iron Filler for Use with Bolted Joints

BY E. P. ROUNDEY, ENGINEER MAINTENANCE OF WAY NEW YORK STATE RAILWAYS, SYRACUSE, N. Y.

The accompanying halftones and drawing show a cast-iron filler which we are using at the joints in connection with paving up to our T-rail, and which may be of interest to your readers. We use a bolted joint, the bolts and nuts projecting 1½ in. beyond the joint plate, so that the groove nose block which fits under the head of the rail cannot be used at the joint. We have heretofore filled the holes around the bolts with cement mortar, but halftone *A* shows the hole which soon develops at the joints with this method. We have also used asphalt which gives much better results than the cement. However, to overcome the trouble we have this year designed and are using the cast-iron filler shown. These fillers weigh 20½ lb. and cost us $0.56 each, or $95.20 per mile of single track if 62-ft. rails are used. The fillers should outlast at least two sets of rails and then have an appreciable scrap value. If desired the holes in the filler can be made square instead of round, so that they will also prevent the nuts from turning.

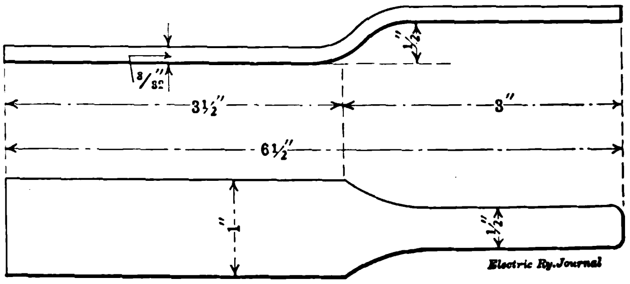
Bonding Cable Sheaths

BY G. H. MC KELWAY, ENGINEER OF DISTRIBUTION BROOKLYN RAPID TRANSIT SYSTEM

While in many places the lead-covered underground cables are not even bonded to the negative bus in the power or substations, yet this should be done in all cases as a preventative of electrolysis; and in manholes with more than one cable the sheaths of the cables should be bonded together. This may seem to be an unnecessary precaution, but if it is not applied noticeable differences of potential will be found between the sheaths of the various cables, especially if the cables drain the current from several points.

Many companies now make it a practice to bond all of their cables together in each of their manholes, using ordinarily a No. 6 B & S gage copper wire soldered to the sheaths of the cables and running from one of them to the next. The trouble with this plan of bonding is that when one of the cables becomes grounded its lead sheath immediately forms one side of the circuit back to the station, and therefore carries much current because the cable has been short-circuited. This heavy flow of current spreads from one cable sheath to the others over the bond wires and is usually great enough to cause them to be fused. If the burning-off of the bond wires was all that occurred the damage would not amount to much, but the fusing of the wires also burns the lead sheaths to which they are attached. Hence after such a burn-out, even if only one cable has failed, it is generally necessary to make repairs to the sheaths of several other cables to prevent water from working into the paper through the holes in the sheaths.



COPPER STRAP FOR BONDS ON CABLES

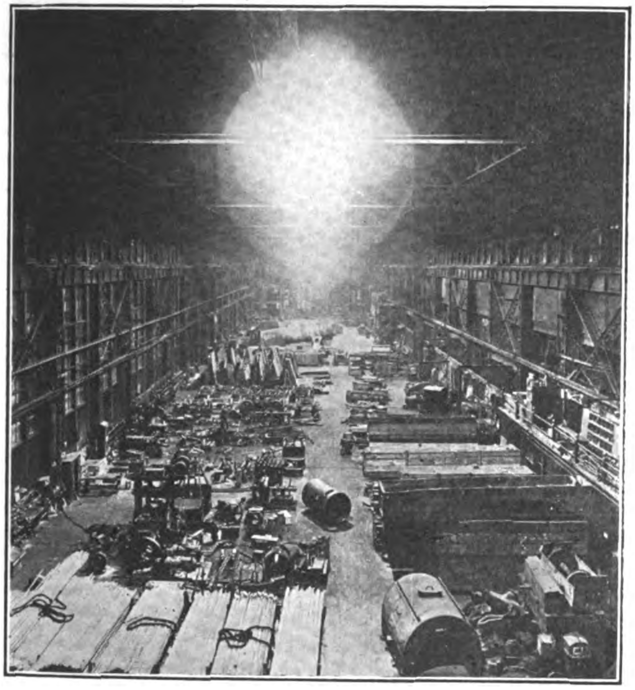
A better arrangement than the plain No. 6 wire, although slightly more expensive in first cost, is that shown in the illustration. Here a copper strap is made and soldered to the lead sheath, the portion in contact with the lead being 3½ in. long x 1 in. wide. The rest of the strap, approximately 3 in. long x ½ in. wide, is raised ½ in. from the sheath and to it the bond wire is soldered. With this plan there is a contact area of 3½ sq. in. between the strap and the sheath, so that there is no danger that the sheath will be burned by the drawing of a heavy current through a poor connection. Neither is there any danger that the sheath will be damaged when the bond wires fuse, for they are at least ½ in. away from the lead and are likely to burn apart even further away. The copper strap costs but little more than enough No. 6 wire to wrap well around the cable, so that the only additional cost over the old plan is the labor of attaching the strap to the sheath and the wire to the strap, instead of bonding the wire directly to the cable.

Mercury Quartz Lighting of a Railroad Shop

The accompanying halftone is a night view of one of the shops of a prominent Eastern railroad. The buildings are 528 ft. long and 58 ft. wide, giving an area of 30,624 sq. ft. in each building.

The illumination for these buildings is furnished by type Z Cooper Hewitt quartz lamps operating on a 220-volt d.c. circuit. This lamp is a modification of the well-known Cooper Hewitt lamp based on the same fundamental principles, but possessing some essential differences. The lamp uses the mercury vapor and a short tube of pure fused quartz instead of the long tube of lead glass in the older types.

Ten lamps are installed in the boiler shop, placed at regular intervals of 52 ft. down the middle of the building, each lamp lighting an average of 3062 ft. In the erecting shop there are twelve lamps regularly spaced down the middle of the building at intervals of 44 ft., giving an average space lighted by each lamp of 2552 ft. All the lamps are hung at a height of 50 ft. above the floor. The lamps are rated at 2400 cp with an energy consumption of 725 watts, or a total for the installation of approximately 16 kw. The light afforded by these lamps is entirely sufficient for all purposes, even the locomotive pit being well illuminated. The only other form of artificial light required is a portable hand lamp needed by the workman when he goes inside the boiler.



EFFECTIVE ILLUMINATION WITH MERCURY-VAPOR LAMPS OF QUARTZ TYPE

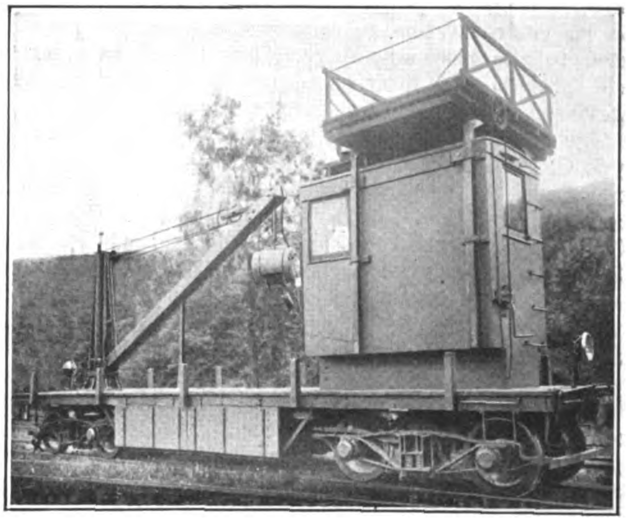
The total lumens per lamp from these units is 14,603, with a total available in a zone of 0 to 60 deg. of 10,800 lumens per lamp which, with a wattage of 725 gives a value of 20.2 total lumens per watt, and 14.9 available lumens per watt. The efficiency of the system as installed is made evident from the low wattage consumption obtained per square foot, these being 0.28 for the erecting shop and 0.24 for the boiler shop, the former being said to be the best-lighted erecting shop in the country. The average candle-feet obtained are 4.24 for the erecting shop and 3.53 for the boiler shop.

No better evidence of the success of the installation from a practical viewpoint can be secured than the commendation of the employees who are working under the light. They are universally pleased with it, yet when a trial installation of four lamps was first made, there was a certain antipathy to the light on the part of the men employed, because of the difference in color value, but this speedily disappeared after they gave it a thorough trial. This trial resulted in the adoption of the complete installation of these units.

The lamps have been installed at various times, but the entire outfit averages practically sixteen months and the maintenance charges for the period totals $134.54, or $4.58 per lamp a year.

A Storage Battery Way-Service Car

The emergency, wrecking and construction car shown in the accompanying cut has just been built for the Havana Central Railroad by the Field Omnibus Company, New York, as the first car of its kind. Three more are under order from the same company. These cars are designed for wrecking and construction purposes on the railroad system named, part of which is equipped with overhead trolley. The cars are built to operate from the trolley wherever available and from storage batteries elsewhere. The batteries may be charged directly from the trolley wire at any point on the trolley system. The normal speed of the car on level track when operating from the trolley is 35 m.p.h., and when operating from the Edison batteries the speed is 20 m.p.h. It is stated by the maker of the vehicle that the guaranteed 70-mile capacity of the batteries is exceeded by 50 per cent. The battery equipment comprises 280 A-6-H cells.



STORAGE-BATTERY EMERGENCY, WRECKING AND CONSTRUCTION CAR FOR HAVANA CENTRAL RAILROAD

The hoisting motor and air compressor motor are operated from the storage batteries. The car is controlled and operated entirely from the cab. On the roof of this cab is a raising trolley tower which may be extended 7 ft. out from the side of the car.

Although the car was not intended to have enough capacity to haul other cars, it shows ample power for this work. After a 65-mile run with the batteries it has pushed a 25-ton car up a 7 per cent grade, the energy still being secured from the storage batteries.

The car has two GE-25-hp motors, both mounted on one truck. The trucks are equipped with roller bearings. The energy consumption of the first car, as determined by a 60-mile run on the tracks of the Pennsylvania Railroad on an official test, showed an average of 30.2 watt-hours per ton mile.

A Rail Weld Saving

A typical example of the savings possible with the Indianapolis portable electric welder is reported by the manufacturer from a property which is using four of these machines.

On the head of the rail in a paved street a cast-weld joint had broken out down to the web and for a distance of 4⅞ in. A new head was built up on the rail by a single operator and a helper in one hour and forty minutes, at a total cost, including time, welding steel and current, of $2.17. The former method of cutting out a section of the broken rail and welded joint and inserting a short piece of rail of special splice plate, together with the taking up, replacement and relaying of the paving block would have required nine and one-half hours at an outlay of $14.83. Further, this breakage occurred on a line operating cars at two and one-half minutes headway, yet the welding caused no interruption of traffic.

Four Gas-Electric Motor Cars for the Illinois Central Railroad

The Illinois Central Railroad, Chicago, Ill., has recently contracted with the General Electric Company for four gas-electric motor cars, which will be placed in commission for supplementary service on some of the connecting lines of the company. The railway company has not yet advised where these cars will be placed in operation, but is canvassing the branch line service on its entire system to ascertain where they may be used to the best advantage. The initial installation will probably be distributed partly on southern and partly on northern branches of the road.

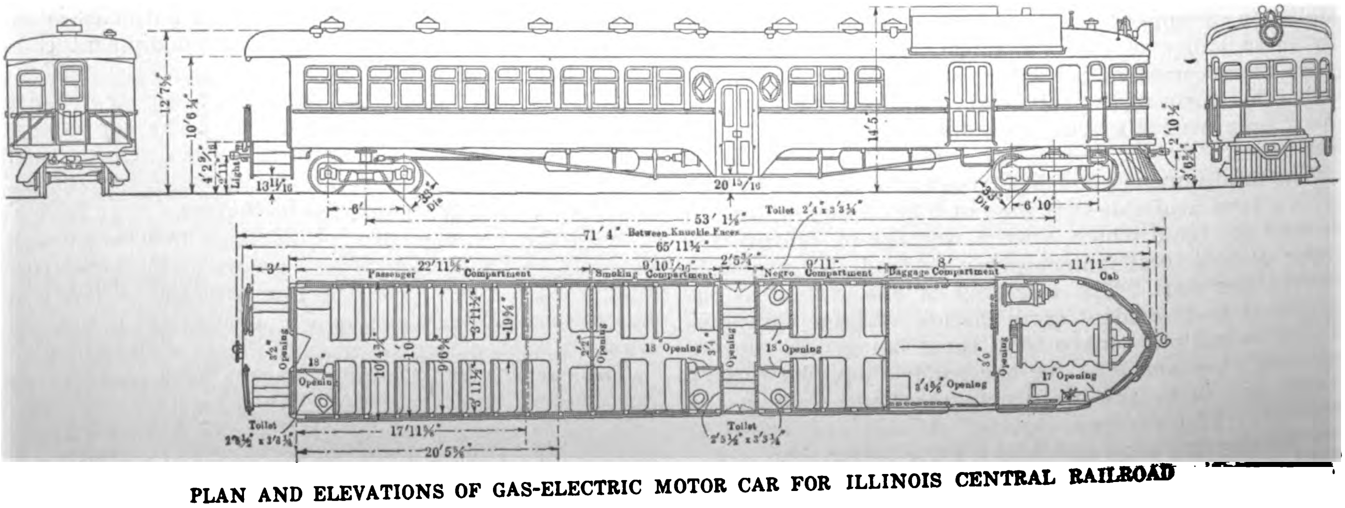
The cars of this company will be what is known as type CRE-70-B-8. The details of construction conform in general to those of the standard gas-electric motor cars manufactured by the General Electric Company. These cars measure 71 ft. 3⅞ in. over bumpers by 10 ft. 6⅜ in. wide over all, weigh approximately 51.5 tons, seat eighty-six passengers and are each equipped with two GE-205 600-volt, box-frame, oil-lubricated, commutating pole railway motors having a total of 200-hp capacity. The motors are mounted with nose suspension directly on the axles of the forward truck. The generating unit consists of an eight-cylinder, four-cycle gas engine of the "V" type, direct-connected to a 600-volt, commutating pole electric generator, designed to meet the special conditions the service demands.

The interior of the cars is partitioned into five compartments. The cab in front, containing the power plant apparatus, measures 11 ft. 11 in. long; next is the baggage room, 8 ft. long; then the colored passenger compartment, 9 ft. 10⅞ in. long; the smoking section, 9 ft. 10 in. long; and the passenger compartment, 22 ft. 11⅞ in. long. The body of the cars is of all-steel construction, except the seats and interior finish, which are of mahogany. Center vestibules with side entrances run between the passenger and smoking and smoking and colored passenger compartments. A rear platform entrance is also provided. The bearings and treads and flanges of the wheels conform to M.C.B. standards. The trucks are of the heavy swing bolster type with elliptic bolster and coil equalizer springs.

Steel Freight Car with Unique Framing

W. R. McKeen, Jr., inventor of the well-known McKeen gasoline motor car, has recently secured patents on a steel freight car with unique framing of commercial shapes, comprising chiefly a herringbone truss for the underframe, and a combination of plate and truss girders sheathed for the sides. The whole produces as a unit structure a trussed car body comprising underframe and floor, side and end frames, roof frame and sheathing for roof and walls, all formed of metal to constitute practically a tubular truss. Normal stresses received either in pulling or in buffing are transmitted by the coupler and draft gear to the draft sills, and by these and the center sill and diagonal braces to the bolsters, side sills and end sills, and from the side sills and end sills through the uprights and their bracing to the top plate and finally to the roof members, the diagonal bracing throughout the floor, sides and ends of the car acting to distribute the stresses over the structure, and thus finally to dissipate them without concentrating undue stress on any part or parts. Very severe or exceptionally heavy stresses are in part transmitted direct to the end sill by the horn of the coupler, as usual, and thence distributed as explained.

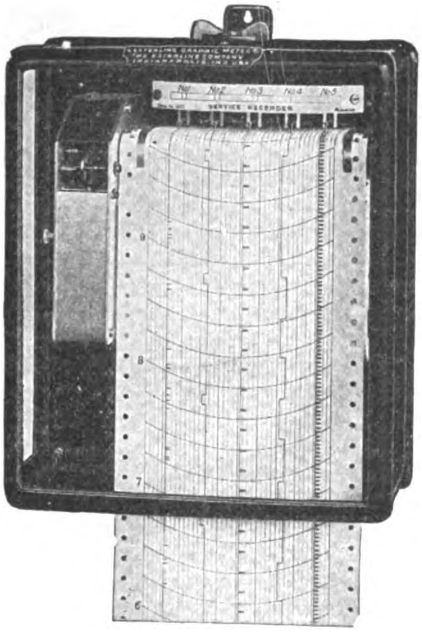
Further, the fact that the metallic plates or sheathing are riveted to the structural or truss members throughout the walls and roof of the car, and are thus held against buckling, contributes enormously to the tying together and bracing or staying of the structural members and to the strength of the trusses themselves. Hence any bending or distortion of said structural members is prevented, thus precluding collapse of the trussing of which they form elements. Together with the structural members arranged to constitute trusses, the plates riveted to them produce combined plate and truss girders. In consequence of the mutual contribution and support so obtained, it is possible to use structural parts far lighter than would be practicable if advantage were not taken of the strength and staying effects of the metal plates or sheathing.



PLAN AND ELEVATIONS OF GAS-ELECTRIC MOTOR CAR FOR ILLINOIS CENTRAL RAILROAD

Service Recorders for Machine Tools

A device intended to increase efficiency in machine tool operation is represented by the new service recorder of the Esterline Company, Indianapolis, Ind. This meter operates on the same general principles as common graphic or curve drawing instruments. It is equipped with any number of pens desired from one to ten inclusive. The instrument is mounted in an enameled metal case with rubber-covered binding posts and has suitable lugs for fastening to a wall or partition. Glass panels permit inspection of the record without opening the instrument.



SERVICE RECORDER WITH RECORD STRIP

The pens rest on a long strip of paper or record chart which is driven through the meter at a constant rate of speed by a jewel balance-wheel type eight-day clock. The clock may be equipped with gears giving five paper speeds of ¾, 1⅛, 3, 6 or 12 in. per hour. An attachment can also be provided on this clock giving additional chart speeds of 45, 90, 180, 360 and 720 in. per hour.

Stops are used to interrupt operation at any time. A regulator is provided for adjusting the speed of the clock in service. Clocks are furnished with a rerolling device for winding up the finished record in the bottom of the case, or this device may be omitted and the finished chart fed through a slot in the bottom of the cover, the record being torn off daily. Record charts are supplied in rolls 90 ft. in length and 6 in. in width. This record may be torn up in short lengths for convenience in filing. Perforations are provided along each margin of the chart which are engaged by pins on the clock driving roll insuring perfect alignment of the paper and accurate timing of the clock.

Each pen is so controlled that when a record is made a vertical line about ⅛ in. long is drawn across the chart, the pen returning to the zero position after each record is made. The controlling devices for the various pens are so connected to different machines that one record is produced for each operation or for a certain number of operations. The record is presented as a series of short lines, the spacings of which represent the rate at which operations are being completed. If the machine is being operated up to capacity, the series of lines will be close together, but if the machine stands idle for several minutes a straight horizontal line will be drawn across the chart showing that no work was accomplished during this time.

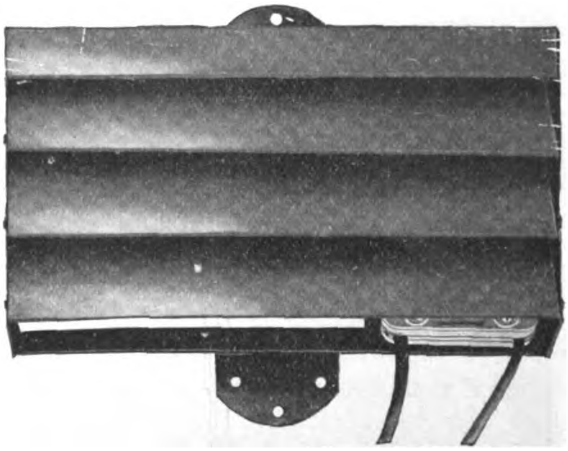
The electrical control for the pens requires such a small amount of current that the energy consumption is negligible. The instruments have high internal resistance and may be operated at any distance from the machines. One instrument may be located in the superintendent's or manager's office and operated by small wires connected to the machines located at different parts of the plant. Any source of direct current may be used for operating the instrument.

On machines operating at a high rate of speed and completing a number of pieces or operations in a short period of time, it is advisable to gear the controlling device on the machine so that one line on the chart will represent ten, 100 or any other convenient number of operations. If operations are completed at a slow rate, then the chart may be worked at a slow speed so as to shorten the record; but if operations are completed at a rapid rate, then a faster chart speed will give a clearer record. These instruments are also furnished with a counting attachment to total the production for a day or other period.

Service recorders are used for a variety of purposes in addition to machine tool records. Each pen can be arranged to give a record of when motors or other machines are being operated and when idle. They are also used for traffic recording on interurban and city railways. In this case, each pen is operated by trolley contacts and records the exact time of cars passing a given point of the system.

A Switch-Stand Light Resistance

A special resistance unit has been brought out by the Nichols-Lintern Company, Cleveland, Ohio, to insure switch-stand lighting with the least amount of wiring and at less cost and maintenance than oil lamps or high-voltage electric lamps. The resistance unit is wound on a pottery tube and is protected against physical and chemical depreciation by means of enamel. It is mounted in a suitable housing for protection against the weather, and is provided with means for thorough ventilation and radiation. Further, it is said to be practically immune to lighting discharges, a factor of no mean importance since continuity of service is essential to safety. The resistance is 11 in. long, 3½ in. wide, 9 in. high over all and weighs 3½ lb. This method of lighting switch-stands has already been applied to seventy-five installations by the Cleveland, Southwestern & Columbus Railway after a competitive test with other methods.



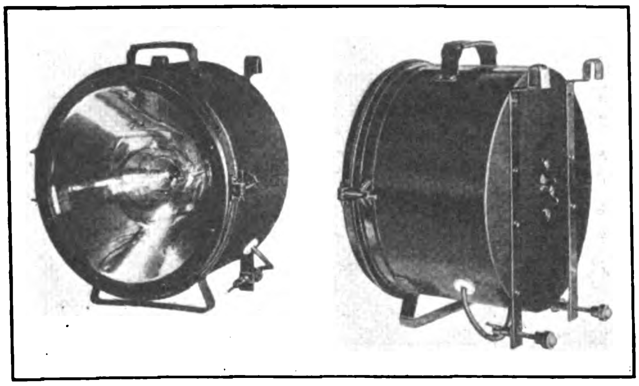
SWITCH-STAND LIGHT RESISTANCE

Report on the Westinghouse Air Brake Story Awards

The committee of three judges, consisting of W. E. Symons, mechanical engineer, Chicago; Willard A. Smith, president and manager, *Railway Review*, Chicago, and R. V. Wright, managing editor, *Railway Age Gazette*, New York, in whose hands the Westinghouse Air Brake Company placed the decision as to the merits of the stories submitted in the air brake story contest recently conducted by it, has just rendered its report, which shows the lucky prize winners to be as follows: First prize, $1,000, James Cain, engineer, Wabash Railroad, Peru, Ind.; second prize, $500, H. C. Woodbridge, general manager's special representative, Buffalo, Rochester & Pittsburgh Railroad, Rochester, N. Y.; third prize, $200, Alexander M. Stewart, engineer, Illinois Central Railroad, McComb, Miss.; fourth prize, $150, D. Oxenford, road foreman of engines, Lehigh Valley Railroad, New York; fifth prize, $100, Carl H. Fuller, chief engineer, Macon Railway & Light Company, Macon, Ga., and sixth prize, $50, Millard F. Cox, assistant superintendent of machinery, Louisville & Nashville Railroad, Louisville, Ky.

Interurban Headlight with Modern Incandescent Filament

Another addition to the "Golden Glow" line of headlights, manufactured by the Esterline Company, Indianapolis, Ind., has just been put on the market. This lamp, designated as Type T-128, has been produced especially for interurban electric railway service. It is of the incandescent type, employing as a source of light concentrated filament Mazda bulbs of high power and intensity. This type is intended to replace the standard 4-amp arc lamps commonly used in interurban service. The makers state that in the volume of light it equals and in many cases is superior to the arc lamp, while at the same time it gives a steady, uniform light.



INTERURBAN HEADLIGHT WITH INCANDESCENT FILAMENT

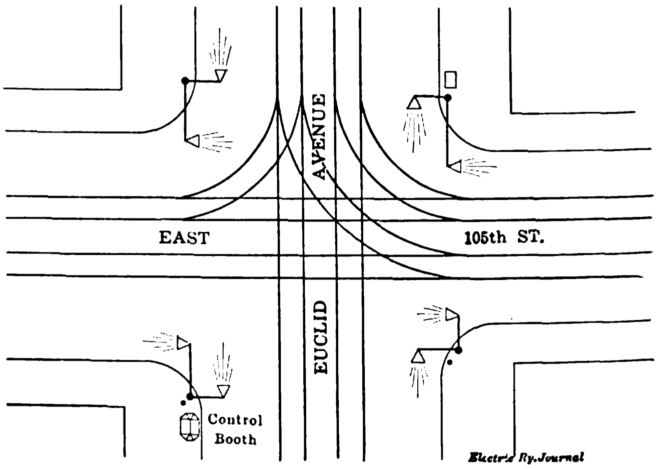
The reflector used in this lamp is 12 in. in diameter and has a depth and focal length of proper design to accommodate spherical bulbs up to 150 cp. It has a polished glass parabolic mirror, which is suitably colored to extract all blue and violet rays from the beam of light. It is asserted that the blinding effect of brilliant headlights, and the tiring of the eyes of engineers and motormen, is due largely to the presence of the blue and violet rays in the light from an arc. The removal of these rays not only renders the beam of light less blinding and less discomforting, but enhances the ability of the motormen to see the track ahead, especially in misty and foggy weather.

The reflector is mounted in a heavy sheet steel case which is finished inside and out in black baked enamel. The door is made of pressed steel and is arranged to fit tightly over a sealing ring to make the lamp dust-proof and waterproof. The body is fitted with standard hangers and is equipped with a focusing screw so that the position of the bulb in the reflector can be adjusted without opening the lamp. It is asserted that numerous tests on interurban lines have demonstrated that this lamp when fitted with a standard bulb will enable the motorman to see light-colored objects on the track at a distance of 1500 ft. and dark-colored objects at 900 ft. to 1000 ft. As the source of light is an incandescent bulb, the flickering unavoidable in arc lamps is eliminated. The weight of the lamp complete is 16 lb.

Illuminated Signals for Traffic Control at Cleveland

The traffic signal system installed some time ago at the corner of Euclid Avenue and East 105th Street, Cleveland, Ohio, by the American Traffic Signal Company of that city should be of interest to all concerned with the prompt and safe movement of city traffic. This particular installation is operated by the police force.

As will be seen from the accompanying drawing, the system consists primarily of eight high-power lights, located in pairs at the four corners of the intersecting streets. They are placed about 15 ft. above the pavement and therefore may be seen for some distance away. One of each pair of lights is red and the other green, and they are so placed that a red light at the right hand and on the near side of the crossing and a green light on the far side faces traffic from any direction that approach may be made. The showing of the red light means that traffic must stop, while the green light indicates that it may proceed. When one color is switched on the other is turned off. Again, when the red light shows in one direction the green light is visible in the other.



PLAN OF TRAFFIC SIGNAL INSTALLATION AT CLEVELAND

As the signals are so high above the pavement the car or vehicle operators who are stopped some distance from the crossing see the signals at the same moment as do those who are nearer, thus preventing loss of time almost entirely. This method is superior to having an officer stand in the middle of the street, even where he uses a whistle as a signal. Many accidents have occurred because people are liable to mistake the whistle warnings of an officer, but in this system the signals are fixed and unmistakable.

All the cars and vehicles may move up close to the corner when the red light is shown and remain there until the green light across the street indicates that the way is clear. This, of course, gives permission to cross the street, and those wishing to do so may turn out of the line to the right. The problem for some time was how to handle those who wish to turn to the left and yet prevent loss of time. This system therefore provides that those wishing to turn to the left into the cross street shall drive out as far as possible into the street at the extreme right and stop. When the signals are reversed those waiting may complete their turn and proceed with the traffic moving in the direction they wish to go. They are in such a position that the traffic on the opposite side of the street may move on past them.

The lights are operated by the local traffic officer from a glass-inclosed booth at the northwest corner at the curbing. The floor of the booth is raised enough to afford him a full view in every direction. Current is furnished for the lights by the city, and switches controlling them are mounted for operation by the officer when seated in the booth. Where desired, the signal maker furnishes a set of auxiliary control switches located in a metal box in the center of the street so that the traffic officer may operate the lights from that point if it is necessary for him to remain in the street for some time. Experience at this point indicates that the corner location is preferable in many ways. Here the officer may be conveniently reached by those who wish to make inquiries and they, as well as he, avoid the danger of standing in the center of the street intersection.

HOTEL
EGENT
HOTEL

SCENE AT EUCLID AVENUE AND EAST 105TH STREET, CLEVELAND, WHERE TRAFFIC SIGNALS ARE USED

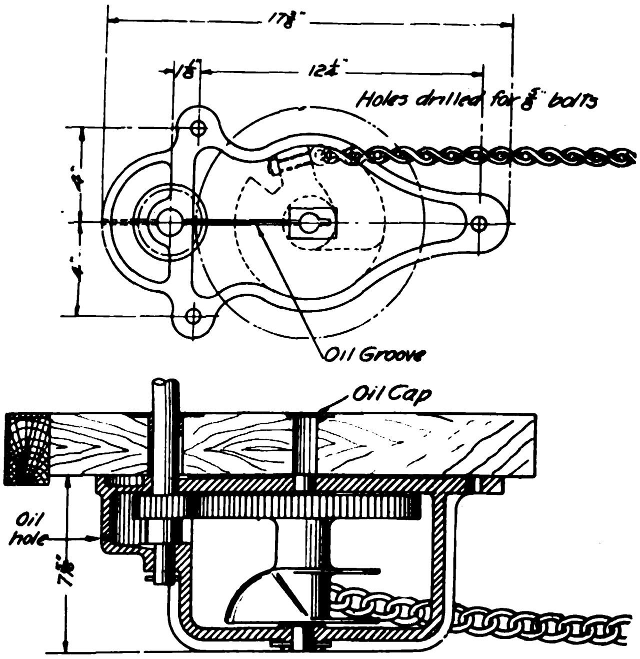
In changing the lights the officer merely turns a lever in front of him, but if it is necessary for the fire department to pass that point with its equipment he has an emergency switch which sets the red lights to flashing and a gong on each of the four street corners to sounding. He may go to the center of the street after turning on the emergency to signal the equipment over the crossing; and in case two or more equipments approach from different directions at the same time he can prevent the possibility of collision. However, several experiences have shown that the crossing can be cleared within a few moments, and since the system was installed the fire equipment, located 200 ft. away, has never been compelled to halt because of street traffic.

Fire and police telegraph signals have been placed in the officer's booth to warn him when this street intersection will be used for emergency purposes. This gives him full command of the situation in ample time. Street cars come to a stop on each side of the intersecting street when the flashing lights show and the gongs sound, while all vehicles drive to the curb and leave as wide a clearance as possible. Further, all persons in the vicinity also become aware at once of the near approach of the apparatus. Should the traffic officer be off duty the system may be controlled by telephone or telegraph from police headquarters or the fire department.

It has been estimated by traffic officers and autoists that this system has increased the traffic speed from 25 to 30 per cent. This gain, of course, is of special importance to the railway in maintaining its headway, and the installation is of still further value in preventing accidents.

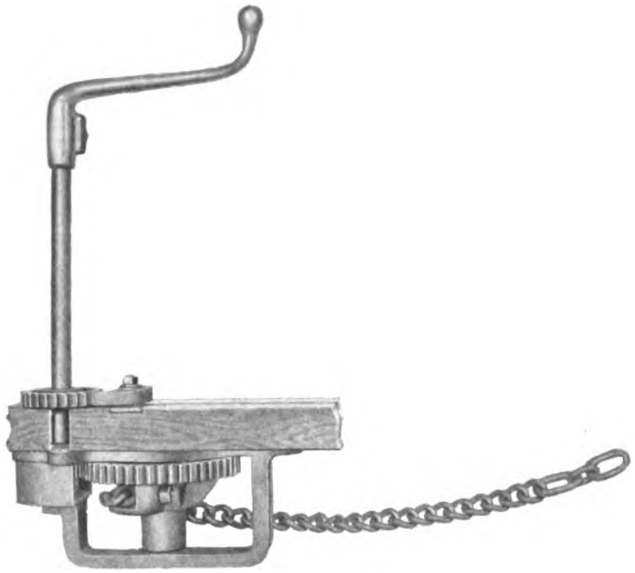
A Light and Powerful Hand Brake with Automatic Lubrication

The Lord Manufacturing Company, Brooklyn, N. Y., has this year effected some notable improvements in hand-power brakes. The new Lord differential staffless brake was described in the ELECTRIC RAILWAY JOURNAL for May 23, 1914. In addition to this brake the company has recently redesigned and materially improved the "Giant" brake, formerly manufactured by the Sterling-Meaker Company. The changes have been so marked that the name has been altered to the "Giant Perfected" brake. This brake can develop a tremendous brake pressure, and yet its weight, 43 lb., is said to be less than any other geared hand brake now manufactured. The platform space has been cut down to a minimum, as shown by the very shallow housing illustrated in an accompanying cut. The general outline and the over-all dimensions of the redesigned brake are also illustrated. Particular attention is called to the rigid construction of the new housing, which is attained by means of a longitudinal arm which supports the lower drum shaft bearing.



DETAILS OF GEARED HAND BRAKE, INCLUDING DIMENSIONS

The castings are of malleable iron. The pinion for driving the gear is squared for connection to the brake staff, eliminating the use of a key and keyway. Oil grooves and cups are provided for convenient automatic lubrication of both the gear and pinion bearings. This feature alone embodies a big improvement in hand brakes. The new brake is made with three different types of chain drums; the regular drum with slack absorbing eccentric; the inverted drum with slack absorber at the bottom and provision for winding the brake chain upwardly, and the straight drum without the eccentric shoulder. For heavy cars where much chain travel is necessary, the slack absorbing type of drum is essential to efficient and prompt operation. When brakes are considered for light-weight cars having little travel in the truck levers, the straight drum without the large slack absorber is sometimes more desirable, as high brake pressure can be obtained at once without need of special provision for the quick taking up of slack chain. The periphery of the chain drum is so constructed that a smooth and natural path is provided for the brake chain. The sloping shoulder adjoining the eccentric guides the brake chain to the straight spindle of the drum. This arrangement eliminates undesirable projections upon which the brake chain might bind, and thereby assures smoothness of action as the brakes are released.



GEARED HAND BRAKE AND CHAIN AS INSTALLED

Another improvement is a provision for limiting the amount of release to eliminate lost motion when applying the brakes, and to enable the motorman to work more efficiently. This feature is accomplished in the following novel manner: A spiral groove is cast in the roof of the housing, through which a so-called stop pawl connected to the gear drum operates with the application or the release of the brake. A stop block is placed in the spiral groove which halts at the proper distance any superfluous unwinding of the chain which tends to follow due to the momentum. The stop pawl can be furnished in a variety of lengths without altering the other parts of the brake; so the automatic stop in this brake may be said to be adjustable.

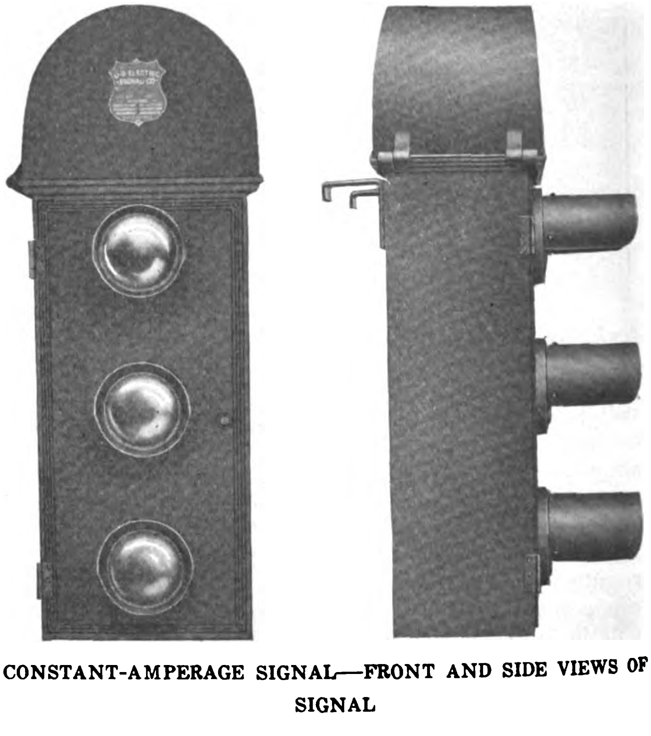
The table below shows the chain tension that can be obtained with this brake for each of its three ratios, together with the travel of the brake rod per turn of the brake handle:

	Gear Ratio, 18-42	Gear Ratio, 14-46	Gear Ratio, 12-48
75 lb. on a—			
12-in. handle—chain tension..	1200 lb.	1687 lb.	2057 lb.
13-in. handle—chain tension..	1300 lb.	1827 lb.	2229 lb.
14-in. handle—chain tension..	1400 lb.	1968 lb.	2400 lb.
Average chain travel per turn of handle	5¾ in.	4⅛ in.	3⅜ in.

The manufacturer feels that all of the requirements of high power, compactness, quick action, easy application and definite release have been foreseen in the design of the "Giant Perfected" brake, and that these qualities have been combined with extreme simplicity of design.

Constant-Amperage Light Signal for Electric Roads

Probably in no class of apparatus for use on electric roads has the interest increased more rapidly during the past four or five years than in signaling. The increased interest is only natural as signals are used on suburban and interurban electric roads, many of which have only been completed in the past few years. Another reason for the increased interest is that, at first, many roads, while appreciating the operating value of signals, did not so fully appreciate the safety features of them until the need of the safety feature was vividly brought to their minds by some bad collisions which received great publicity. The manufacturers of signals, of course, have developed signals in accordance with the demands of the users. The users of signals on electric roads, of necessity, have had to demand from the start that the signaling apparatus must be sold at a low figure and the manufacturers have had to produce such a signal.

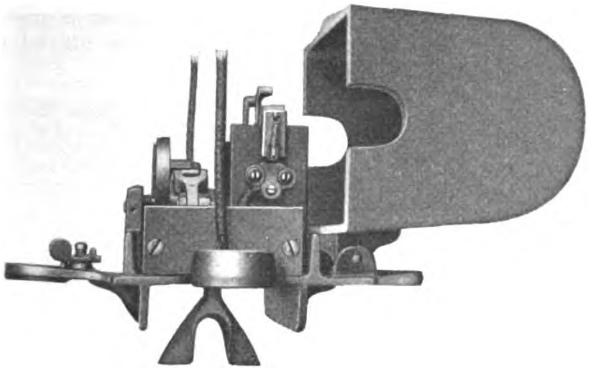


CONSTANT-AMPERAGE SIGNAL—FRONT AND SIDE VIEWS OF SIGNAL

In the development of electric railway signaling the old hand-throw signals were, as an apparatus to operate by, fairly satisfactory, but as schedule speed became more of a factor, there arose a demand for a signal which was operated automatically and which could be passed without stopping the car. In addition, it was found that, with a partial ground or a partial feed on the line wire of the hand-throw signal, a proceed signal could be given at both ends of a block, several collisions being caused in this way. The automatic signal was, therefore, designed not only to be automatic but to be safe in case of a break, cross, ground or foreign feed on the line wires.

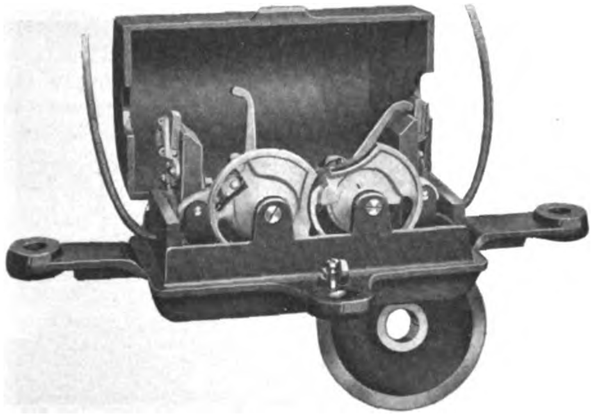
As signals on electric railways came more and more to be considered as safety features more thought was given to signal design so that operation would be safe under unusual conditions that included not only simple crosses, breaks, foreign feeds and grounds on the line wires but also all of the various simple combinations of them. However, in actual practice this step has been approached with considerable hesitancy owing to a feeling that, in order to make signals safe under these unusual conditions, there were required more complicated mechanisms which were more expensive to install and to maintain and that protection against combinations of line-wire troubles was not warranted.

It is, however, beyond dispute that it would be desirable to design a signal not only to be safe in case of a simple foreign feed, break, ground or cross on the line wires, but also to be safe for combinations of these as well, provided the mechanism was not complicated nor increased in cost, and the United States Electric Signal Company of West Newton, Mass., now claims to have produced the first contactor operated signal which meets these requirements. This is the new Type-M signal, illustrated herewith, which safely takes care of twenty-four combination line-wire troubles.



CONSTANT-AMPERAGE SIGNAL—END VIEW OF CONTACTOR

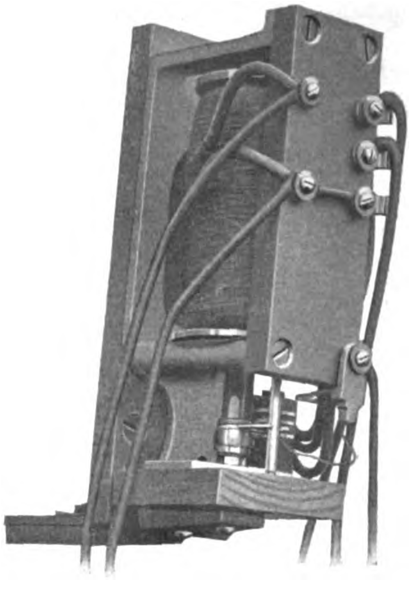
The new signal is of the all-light type, using lights for day indications as well as at night and being simpler than a semaphore signal as the blades and the mechanisms for operating them are eliminated. In the past, light signals operated by trolley current have not been altogether satisfactory, for while sun shields have largely eliminated the troubles due to the sun's rays and suitable lenses have been developed, yet the great fluctuations of voltage which occur in service result sometimes in practically putting out the lights during the peak load. The Type-M signal, however, employs a simple current regulator which keeps the lights constant regardless of the voltage. This is a simple solenoid that uses a very small amount of current and has a laminated plunger carrying a contact.



CONSTANT-AMPERAGE SIGNAL—SIDE VIEW OF CONTACTOR

The plunger moves up and down in accordance with the voltage fluctuation and makes contacts at various points, shunting out portions of a resistance which is in series with the lights and keeping the amperage in the lights constant. As the contacts rub and as the amperage and voltage are very low the arcing is practically imperceptible and the contacts therefore cause no trouble.

The new contactor that is used with this signal is designed so that the contact fingers are mechanically locked in the open position and cannot be jarred into contact by any blow on the contactor or span wire. The fingers will operate only after the pendulum that is operated by the trolley wheel has removed the lock from its locking position. The interlocking in this contactor absolutely prevents any simultaneous operation of the two contactor fingers.



CONSTANT-AMPERAGE SIGNAL—CURRENT REGULATOR

The Type-M signal is of the car-counting type and registers up to fifteen cars in the block. It is intended for operation on single track between turnouts. When the block is unoccupied, there are no lights showing in the signal, but as the car enters the block the counting-in magnet is energized, a red light shows at the far end of the block and a yellow light, which is the top one of the three lights in the signal, shows at the near end and gives the proceed indication to the motorman.

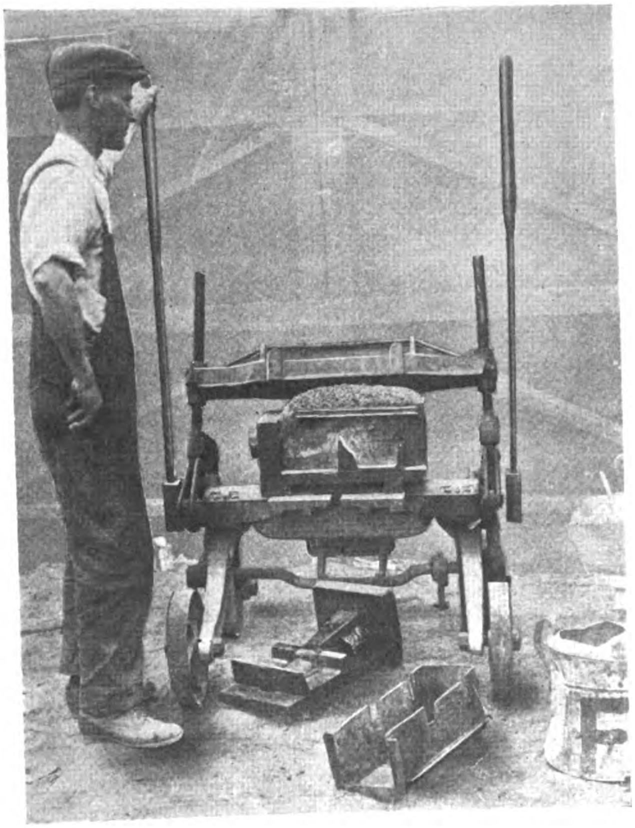
If a second car approaches the block and the motorman sees this yellow light at the top of the box he knows that there is a car in the block going in the same direction as himself. As the car passes over the contactor the yellow light located at the top of the box is replaced by one at the bottom of the box and this is an indication that the entering car is properly recorded in the block and may proceed.

A third car entering the block makes the permanent change from the yellow light at the bottom of the box to the yellow light at the top of the box, and each succeeding car makes this permanent change in getting the proceed indication. As each car in leaving the block passes over the contactor at the opposite end, the counting-out magnet is energized one step for each car so that when the last car has left the block the signals go to their neutral positions.

The annual meeting of the Massachusetts Street Railway Association was held at Young's Hotel, Boston, Mass., recently, and the following officers were elected for the ensuing year: President, H. H. Crapo, New Bedford; first vice-president, W. W. Sargent, Fitchburg; second vice-president, D. A. Belden, Haverhill; treasurer, Fred H. Smith, Quincy; secretary, Charles S. Clark, Boston. The executive committee consists of Messrs. Crapo, Sargent and Belden, Robert S. Goff, Francis H. Dewey, P. F. Sullivan, J. T. Harmer and J. L. Richards.

Simplified Method of Making Thermit Insert Joints

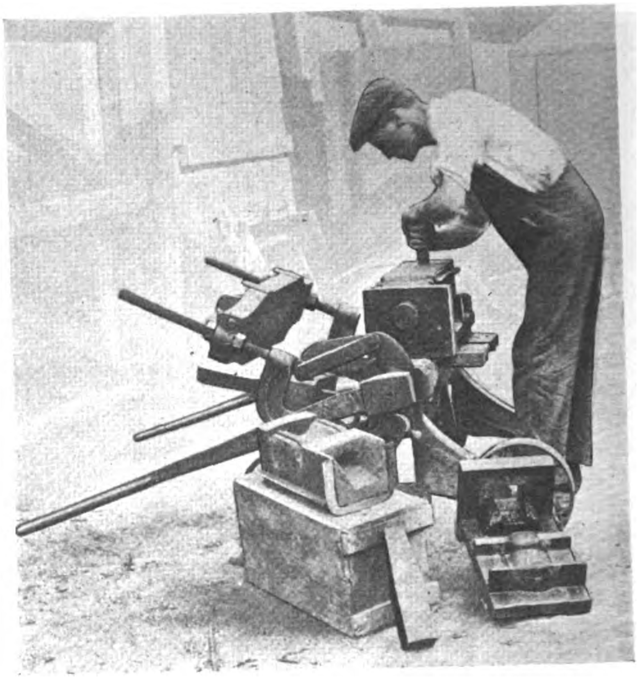
The Goldschmidt Thermit Company, New York, announces that its method of installing thermit insert joints has been so simplified that hereafter the welding may be carried out directly by the railway instead of by contract, whether the job calls for one joint or a thousand. At the same time the cost of the completed joint has been appreciably lowered. The company will sell the complete outfit and supply an experienced foreman at the start to instruct the customer in making the welds. It is confidently believed that street railway companies owning the necessary equipment and having a properly instructed welding gang will now be able to weld a 9-in. rail at a cost not exceeding $7 per joint and a 7-in. rail at about $6.50 per joint, including a fair proportion of the first cost of material and apparatus for depreciation and maintenance.



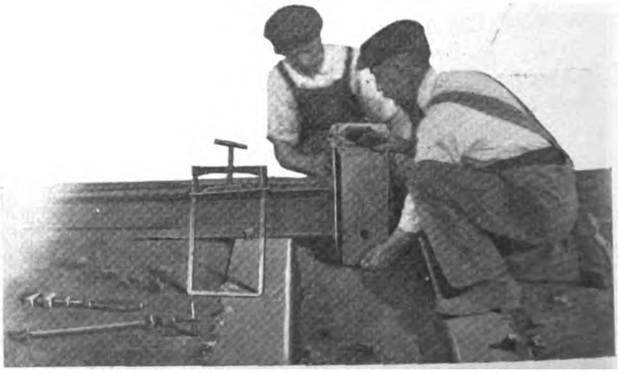
RAMMING MOLDS ON SQUEEZER FOR THERMIT INSERT RAIL WELD; PATTERN AND MOLD BOX SHOWN IN FOREGROUND

ADJUSTING ASBESTOS AND MOLASSES STRIPS TO RAILS PREVIOUS TO PUTTING ON MOLDS

The improvements apply to the methods of making and adjusting the molds so that the operation of ignition, melting and welding can be quickly executed but without any danger that the thermit steel, which is exceedingly liquid, will run out. Up to the present time, the general practice was to ram the two-part molds by hand, clamp them to the rails and lute around the edges with fire-clay. Now the molds are rammed on a foundry squeezing machine which enables one man to do this work with great facility, while the molds are constructed with a bead around certain parts which is compressed when the two parts are clamped together to form a safeguard against a run-out between the two parts of the mold. While the molds are being prepared another man adjusts two cords of asbestos dipped in molasses to the rails at a point just inside of the mold box. The molasses is sticky enough to make these cords adhere tightly to the rail, and when the mold boxes are adjusted these cords are compressed, forming a very efficient luting all around the outside edges, between the molds and the rails.



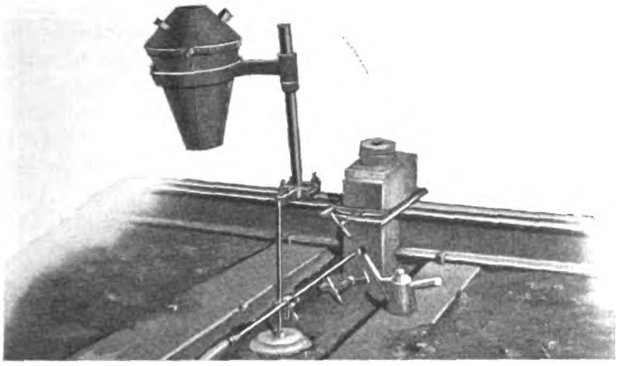
CUTTING PREHEATING GATE IN MOLD WITH SPRUCE CUTTER; COMPLETED MOLD AND PATTERN SHOWN IN FOREGROUND



ADJUSTING THE TWO PART MOLDS TO THE RAILS FOR THERMIT JOINT

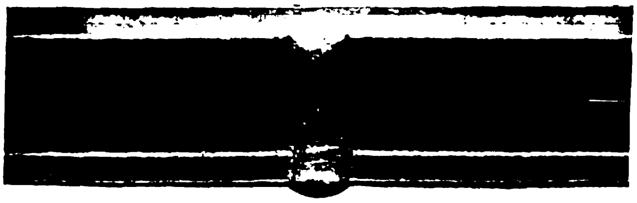
However, to guard doubly against a run-out, a small amount of powdered fire-clay is blown into the molds by means of compressed air. This is directed into the pouring gate while the other openings of the mold are closed temporarily by wooden plugs. If there is any opening around the edges of the mold, the fire-clay is blown into such openings, is caught by the molasses and seals the mold absolutely tight. It also forms a thin coating over the entire interior of the mold, making a weld of smoother appearance. Any surplus of fire-clay is blown out while the rails are being preheated with the molds in place and before the thermit steel is poured in.

These improvements are said to eliminate very greatly the human factor in the welding operation and practically eliminate the danger of run-outs due to carelessness in luting. They also increase the speed with which the molds can be adjusted, luted and poured, so that many more joints can be welded per day than formerly.



MOLDS AND CRUCIBLE CLAMPED TO RAILS READY FOR PRE-HEATING AND POURING

A further saving has been effected in the welding portion. Instead of mixing the additions of manganese, nickel thermit and other materials, for improving the quality of the thermit steel, throughout the thermit itself, these additions are now put up in a sheet-iron container which is placed on top of the mold during the preheating and is heated red-hot by the waste gases. It is then placed in the center of the crucible and is melted down by the heat of the thermit reaction. This method enables the production of more steel from a given amount of thermit without any sacrifice of heat, with the result that the cost of the welding portion of thermit is greatly reduced.



VIEW OF FINISHED WELD

Special tools have also been devised for certain operations to facilitate the work of aligning the rails, welding the joints and grinding them afterward.

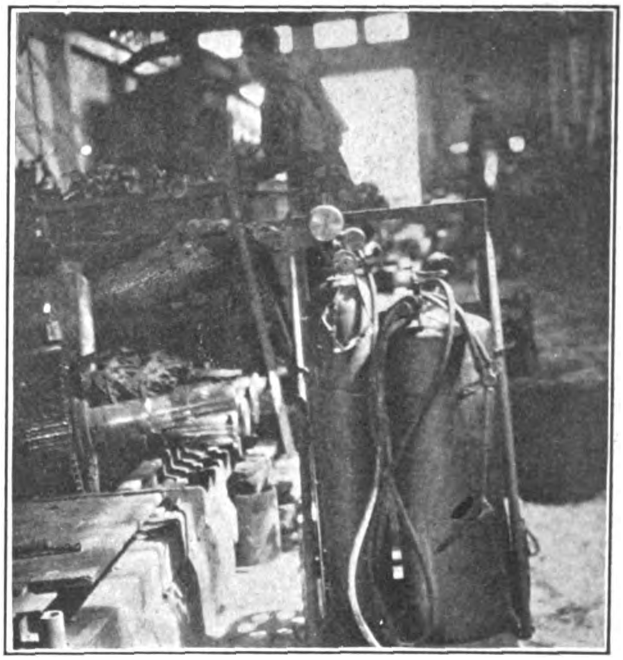
Electric Lantern with Standard Batteries

The H. W. Johns-Manville Company announces a new type of portable electric lantern of exceptionally wide utility, and one which it asserts will find a ready market among lantern users because it entirely overcomes the usual inconvenience in securing proper size batteries. This lantern, called the J-M Mobilite electric lantern, uses standard size dry cells which are easily obtainable everywhere. The use of larger batteries has naturally given this lantern infinitely greater burning capacity, in fact the maker states that with two ordinary good dry cells, used intermittently, it will burn for nearly 150 hours.

The lantern is fitted with a tungsten bulb of very low amperage and a specially designed parabolic reflector. Working in conjunction this bulb and reflector produce a light of remarkable brilliance and power by which objects are clearly discernible at a distance of 150 ft. So powerful is the light that repairs have been made at night on pole lines with one of these lanterns held on the ground pointing upward into the network of high-tension wires. The absolute safety of this lantern has opened up a field practically closed to oil and gas-burning lanterns.

Portable Oxweld Outfit in Aurora, Elgin & Chicago Shops

The main repair shops of the Aurora, Elgin & Chicago Railroad are located at Wheaton, Ill. In these shops the maintenance and repair work is done for the entire system which includes 83 miles of high-speed suburban and interurban lines leading into the heart of Chicago, a 40-mile cross-country single-track interurban up and down the Fox River Valley, and the city street railway systems of Aurora and Elgin, Ill. W. J. Bowman is master mechanic.



PORTABLE OXY-ACETYLENE WELDING OUTFIT

The equipment of the Wheaton shops includes a portable oxy-acetylene welding outfit manufactured by the Oxweld Acetylene Company, Chicago. Mr. Bowman states that an almost unlimited number of different kinds of work can be performed with the oxy-acetylene blowpipe. This outfit consists of one cylinder of acetylene, one cylinder of oxygen, regulating valves for each cylinder and an Oxweld blowpipe with an assortment of tips or nozzles. The different nozzles admit changing the flow of gas and the amount of heat to adapt the flame to the character of work being welded. The outfit is mounted on a two-handled steel truck so that it can be wheeled to any part of the shop. It is but the work of a moment to replace an exhausted cylinder.

Some of the pieces of work done during one day include repairing broken and cracked seat castings, building up the noses of GE-66 motors either by the direct application of metal or by welding on flat pieces of steel and repairing motor-driven air compressor cases. This form of work brings about considerable economy because of the low scrap value of the cases as compared with their first cost. When parts of this character are to be repaired they are inclosed in walls of brick and sheet asbestos and are preheated over a charcoal fire until the metal is relieved of all of the casting strains.

OXY-ACETYLENE WELDING AT A MOTOR AXLE SEAT

The defects are repaired with the oxy-acetylene blowpipe and then the part is recovered so that it may cool very slowly.

In working on large steel castings such as the shells of GE-66 motor, a gas flame with an air attachment is used for preheating, and such parts as the edges of the bearing seats for the axle bearing are preheated for about thirty minutes. This preheating relieves the local part of the casting from the danger of cooling cracks and also greatly reduces the amount of gas required for making welds.

Some of the other pieces of work on which the welder is frequently used include brakeshoe heads, contactor frames, controller segments and the repair of shop machines and tools. Another use is the insertion of new teeth or the building up of broken teeth in the gearing of shop tools. For such work and for similar jobs in which the furnished metal must withstand high stresses the welding is done with nickel steel filler.

The welding outfit is particularly valuable in emergencies when the larger shop tools are broken, because almost any ordinary breakage can be repaired quickly and the loss of time of the machine is thus cut down to a few hours, whereas if a new part had to be ordered and installed the tool might be out of commission for several weeks. Such an incident recently occurred in connection with a large hydraulic wheel press when a ram yoke broke. Another class of work which effects substantial savings is that of applying new metal and building up and filling in the keyways of the taper end of GE-66 armature shafts. Nickel steel is used for this work.

All of the welding operations are performed by three old employees of the company machine shop. These men were broken in for the new work by receiving instructions and experimental practice of one to three days. They receive machinist wages.

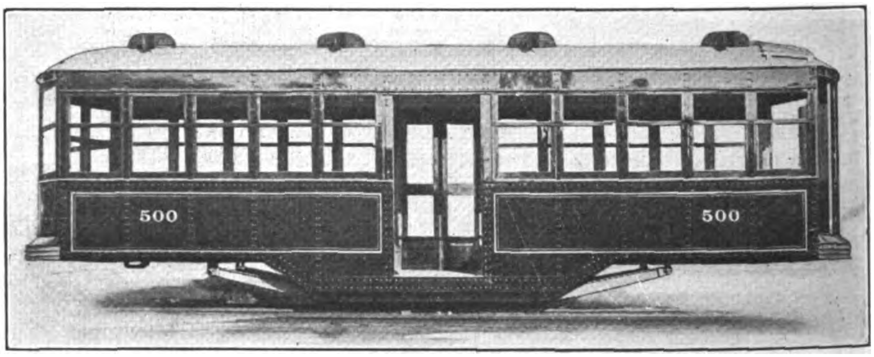
Rules on Inductive Interference

In a communication which appears in the current issue of the *Electrical World* R. D. Coombs calls attention to certain points in connection with the new California rules on inductive interference. These rules were described on page 485 of the issue of the ELECTRIC RAILWAY JOURNAL for Sept. 12. He contends that the rules practically prohibit the construction of power lines or railway rights-of-way which are not usually wide enough to permit the installation of a communication line on one side and a power line on the other. He contends that the provision for a separation not less than the height of the taller supports gives only imaginary safety, as contact of a line with falling wires would not be prevented there.

A Light-Weight Truckless Car

The Laconia Car Company will exhibit opposite the entrance to the steel pier at the Atlantic City convention a low center-entrance, truckless car, 33 ft. over buffers and seating forty-four passengers. This provides an increase of 37½ per cent in seating capacity over standard, double-end cars of the same length. Completely equipped the car weighs less than 500 lb. per seated passenger, the lowest unit weight for any motor car yet exhibited. The car is of semi-steel construction with an arch roof, the top of which is but 10 ft. above the rails. It will be shown completely equipped with 40-hp outside-hung motors and air brakes. The car body is mounted on special pedestals and therefore no trucks are required, duplicate construction being eliminated. The car is equipped with levers pivoted to the journal pedestals and these absolutely prevent oscillation.

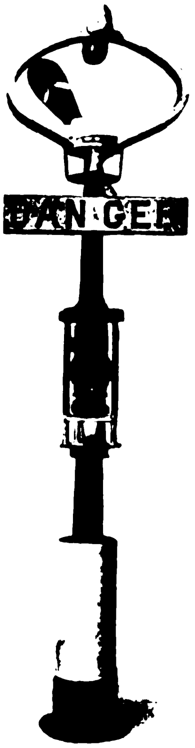
Summed up, the distinguishing features are: *a*, a low entrance which facilitates loading and unloading, improves schedule speed and prevents accidents; *b*, a large seating capacity which provides room for 37½ per cent more passengers than standard double-end cars of the same length; *c*, light weight which is effected by a short framework betwen axles for absorbing the supporting strains; *d*, elimination of trucks, the car body being mounted on special pedestals; *e*, a low center of gravity that is close to the wheels and axles where the starting and stopping forces are applied; and, *f*, absence of oscillation which is absolutely prevented by use of levers pivoted to journal pedestals. The Laconia Car Company will be represented at the convention by Cornell S. Hawley, president; Peter M. King, assistant to president; J. E. Johnson, purchasing agent, and E. J. Fitzgerald, sales agent.



FIRST TRUCKLESS CAR COMPLETE, READY FOR SERVICE

Combined Audible and Visible Highway Crossing Signal

In November, 1911, the Hoeschen Manufacturing Company, Omaha, Neb., designed and installed in a steam railway yard at Shreveport, La., its first visual highway crossing signal. This signal had a locomotive-type bell, waving semaphore blades for day indications and flashing red lenses with an oil lamp for night indications. During the past three years the manufacturer has made several refinements in this type of signal, which has since been adopted as standard on many steam and electric railways. The oscillating illuminated semaphore blades are a supplement to the standard type of crossing bell manufactured by this company and are used on more than a hundred steam and electric railways. The accompanying illustrations show this type of crossing signal, of which more than forty are used by the Illinois Traction System, while about fifty are used by the Aurora, Elgin & Chicago Railroad. Two types of visual aspects are illustrated, the operating mechanism for both being identical.

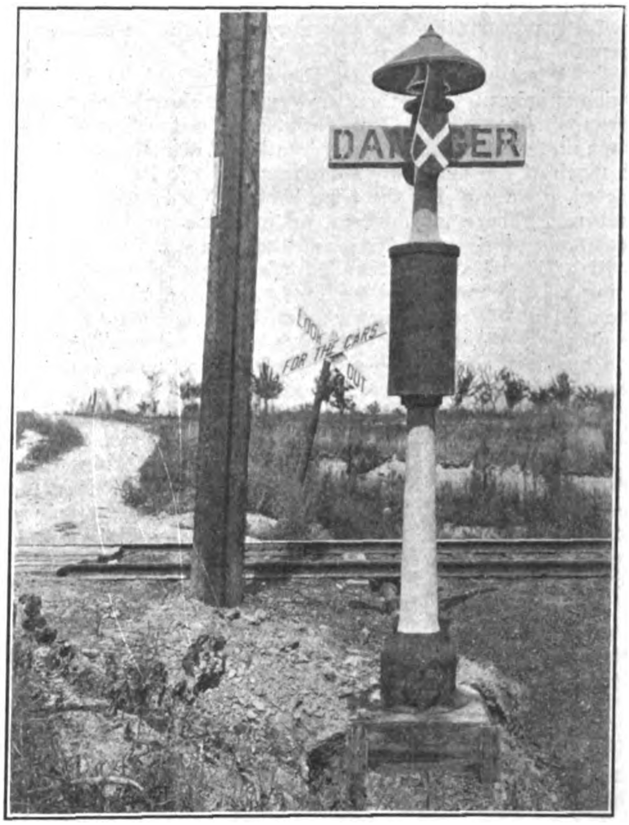


CROSSING INDICATOR

The Hoeschen signal is actuated by a powerful spring motor equipped with three 35-ft. springs, and when once fully wound by the passing cars it is capable of sounding the bell and waving the blade continuously for one hour and forty minutes. The motor is wound by the natural movement of the track rail, which is transmitted to the winding mechanism of the motor by means of a connecting rod and a plunger lever resting against the base of the rail. The starting control of the bell may be located at any desired distance on either side of the crossing to be protected. This control apparatus is not in any way connected with the trolley or transmission circuit, this particular feature being considered as one of the chief advantages of the company's type of crossing protection apparatus. The small electric impulse necessary to unlatch the bell when a car passes the control point is generated in a rugged piece of apparatus also connected with the track rail and actuated by the depression of the rail as the car passes the control point. The generator, which is about 8 in. wide x 10 in. long x 6 in. deep, consists of a laminated permanent magnet through the poles of which two generating coils are bolted. A keeper placed across the face of these two poles is operated by a lever clamped to the base of the running rails in such a way that the rail is twisted and its gage line is raised about $\frac{1}{8}$ in. above normal surface. When a car passes, the rail is depressed to its normal level and the lever connected with the base of the rail kicks the keeper away from the pole faces of the coils which are attached to the permanent magnet. This breaking of the magnetic circuit generates an electrical impulse which is sufficient to unlatch the bell-ringing spring-actuated motor. The passage of the car by the crossing bell and the automatic winding due to the depression of the rail at the bell cuts out the ringing mechanism.

On electric roads where traffic is heavy and cars follow each other at close intervals, a second car may enter the bell section before the first car has passed the bell. This is a common situation which demands the fullest protection. For such operations, the crossing signal must not cut out when the first car passes it, but, on the contrary, must continue to ring until the last car in the bell section has passed the bell. This protection is provided by a simple gravity latch in the spring motor which rings the bell. This latch will drop only while the bell is ringing and will operate only when a second car passes over the starting generator before the first car has passed the crossing. The impulse from the generator, when operated by the second car in passing, will cause the gravity drop latch in the bell to lock the motor release lever so that when the first car passes the cut-out it cannot restore the release lever, thus causing the bell to ring continuously until the last car in the protected zone passes the cut-out at the bell.

Some of the features emphasized as of particular value to electric roads are that no battery or trolley or high-tension connection are necessary and that neither the rail bonding nor the block signal track circuits are interfered with. Simple control is provided for single and double track, and the control also may be made directionally selective if desired. As the weight of the car itself actuates the control, the bell will operate equally well whether or not the train is motor or engine-drawn or whether or not the trolley is on the wire. It is stated that an ordinary single-track installation can be made by three or four men in one day.



CROSSING SIGNAL FOR ILLINOIS TRACTION SYSTEM

The indications available include the loud-sounding locomotive-type swinging bell giving warning like an engine, an illuminated sign reading "Danger," a set of red and white enameled-steel illuminated semaphore blades which wave through an arc of approximately 180 deg. or a combination of the bell and waving arcs. The Illinois Traction System has recently installed at Champaign, Ill., a so-called silent crossing signal equipped with two oscillating blades and a flashing red danger sign 4 ft. long. This signal, with others of the same type to be installed, is placed within the city limits where the noise from a loud bell might be objectionable.

LONDON LETTER

Brief Review of English Tramway and Manufacturing Conditions—Testimonial to Sir Albert Stanley—Other Notes

(From Our Regular Correspondent)

So far the European war has not affected British tramway receipts to any great extent. Almost every city in Great Britain operating tramways has had to contribute to the fighting forces of the country. In Glasgow, for instance, a week or two ago about 800 of the tramway employees had to report to the war office for duty, and it is probable that many others have since gone. Manchester, Sheffield, Bradford and all the other larger cities have suffered in this way to the extent of hundreds of employees, but there has been little curtailment of service and receipts have kept up well. Some tramway extensions which had been contemplated may not be carried out for the time being and municipalities requiring more tramway cars will probably not order them or build them until the effects of the war are better known. In London the car and the omnibus services on the underground railways are all proceeding as usual. A feature is the number of London General omnibuses and London taxicabs which are at the front conveying commissariat and war material. The motor omnibus services in London, however, have not suffered, and one can get transported now as comfortably as before. One of the main steam railways has stopped its work of electrification for the present, and some of the tramway companies have deferred dividends, but otherwise transportation business may be said to be practically normal.

The effect of the war on the manufacturing industries which supply material for tramways and electric railways is perhaps more serious. All Continental construction of tramways and electric railways is practically at a standstill, and as much of the material came from Great Britain it has reflected adversely, for the time being, on the Briitsh manufacturer. There is, however, an immense amount of business from foreign countries, and the Board of Trade and the British Electrical & Allied Manufacturers' Association are doing all they can to gather information and statistics as to the amount of the German competition which there has been in all parts of the world. It is hoped that a large portion of the business which has previously gone to Germany will come to this country. In general, the British manufacturers have decided to continue to advertise, more especially for export business.

A few words as to what the Continent is suffering from a tramway and electric railway point of view would doubtless be interesting, but there is no way of obtaining such information, except in a general way. A few of the tramway systems in Belgium must have been wiped out entirely, but Brussels, though invested by the Germans, does not appear to have suffered much.

All arrangements for the International Tramway Congress, which was to have been held at Budapest early in September, were canceled by the executive council at Brussels on the outbreak of war.

The annual conference of the Municipal Tramways Association was to have been held at Salford in September, but the council felt it inadvisable to hold the conference under the present circumstances.

The council of the Institution of Electrical Engineers has issued a circular suggesting that the members place their services as electrical engineers at the disposal of the war office and of the admiralty and be in readiness to fill vacancies in public services, electric power stations, tramways, railways, etc., caused by the calling up of the reserves and territorial forces. The council desires to receive offers of services from members of the institution and to obtain the names of as many other qualified men as possible who may be willing to offer their services in the directions indicated. The council adds that it has offered to place at the disposal of the war office, for immediate occupation and free of charge, the available portions of the institution building, or a total area of 10,000 sq. ft.

The British Electrical Federation, representing a capital of about £20,000,000 and comprising forty tramway, motor-omnibus, electric supply and electric manufacturing undertakings has established a mutual aid fund to assist the wives, children and dependents of men in active service. This fund will be maintained and supplemented by the federation as long as hostilities last. Every employee who enlists for the war will, on his return, be reinstated in his present position or will have suitable employment with the federation found for him.

The tramways act authorizing the Bristol Corporation to purchase the undertaking of the local tramway company has received royal assent.

The Board of Trade inspector of railways has inspected the new Liverpool tram route, which extends from the Edge Lane terminus to Bowring Park, a distance of 2½ miles. He was accompanied by the general manager of the tramways and the city engineer, and found everything to his satisfaction.

It is anticipated that it will be possible to inaugurate through electric train services between the Elephant & Castle and Watford by the end of this year. This will be the first portion of the intercommunication scheme with the London underground railways made possible by the recent electrification of the suburban lines of the London & North-Western.

One of the first contracts to be transferred to Great Britain on account of the war is that recently given out by the electricity committee of the Bradford Corporation. It had accepted the tender of the Adnil Electric Company, Ltd., London, representatives of the Bergmann Electrical Works, Berlin, for a turbo-generator of 5000-kw capacity. The generator was nearly completed when the war broke out. The committee recently met and decided to relet the contract to the British Westinghouse Electric & Manufacturing Company.

The engineer of the Bradford Corporation Tramways is so well satisfied with the experiments he has made during the last three or four years with the R. E. T. railless trolley buses that he has just equipped an 11-mile circular route on the same system. He contends that for cheapness and comfort the trolley buses are superior to the petrol vehicle. On the other hand, the Leicester tramways committee is commencing to equip certain sections in Leicester with petrol-driven motor buses

The tramways committee of the Liverpool Corporation had before it at a recent meeting a report of C. W. Mallins, general manager, which stated that the chairman, deputy-chairman and himself had had an interview with the chief inspecting officer of the Board of Trade, who had inspected the tram lines and consented to an increase in the speed limit.

J. M. McElroy, general manager of the Manchester Corporation Tramways, was a member of the deputation which recently waited upon the president of the Local Government Board, with reference to a superannuation scheme for municipal officers. Addressing Mr. Samuel, Mr. McElroy said: "In Manchester we have some 5000 employees. We have a thrift scheme whereby the officers contribute 3¾ per cent of their salary and the Corporation 1¼ per cent. In addition, the Corporation adds interest at the rate of 4 per cent. The officers draw their allowance at the age of sixty-five, or, in case of incapacity, earlier. At present the corporation is considering the question of turning this thrift scheme into a superannuation scheme."

A special sub-committee of the Glasgow Town Council's committee on tramways has been appointed to consider and report on the desirability of the tramways department providing cottages to be rented by workmen in the service of the department.

In his report for the year, W. Marsh, engineer and manager of the Brighton Corporation Tramways, says: "Manganese steel plates to the number of 400 were fixed on the joints in Queen's Road and the lower end of Dyke Road, much to the satisfaction of those who live on the routes so dealt with. The reduction in the noise made by the cars was most marked, and it necessarily follows that the life of the rails must be prolonged in consequence."

The tramways committee of the Leicester Corporation finds that cars with canopy tops are much better for meeting the demands of the public than those without, and it has decided to put covers on 75 per cent, or forty-seven of the present cars. The estimated cost is £101 10s. per car for the manufacture and delivery of the canopies, which will be fixed by the Corporation workmen at the car shops.

A. C. S.

News of Electric Railways

OPINION ON TOLEDO MUNICIPAL OWNERSHIP ORDINANCE

Toledo City Solicitor Holds Municipal Ownership Ordinance Legal in Contempt Case Hearing

Wesley S. Thurstin, Jr., city solicitor of Toledo, Ohio, issued an opinion to the City Council on Sept. 28, in which he said that the municipal ownership ordinance, recently voted upon by the electors, had carried legally and that Council now has the right to proceed with legislation for taking over the railway, light and gas properties. He said that the franchise committee should adopt a franchise that can be turned over to the bondholders, in case the city fails to operate the properties satisfactorily, and he held that such bonds, being a lien on the railway property, may be advertised and the Council receive bids for them. The bonds can be transferred when the property is turned over to the city. The opinion rendered by Mr. Thurstin follows in substance:

"The election held on Aug. 4, 1914, was for the purpose of the qualified voters of Toledo passing upon the subject of whether or not the city of Toledo should own and operate the public utilities of street railway, electric light, gas and heat, and a certified copy of such ordinance, together with the result of said election, is now on file in the office of the clerk of this body, and which should be by him recorded in his latest volume of city ordinances and published as other ordinances are published.

"This ordinance is legal. It received a majority vote of those participating in the election and thus becomes an ordinance of Toledo, and, in my opinion, not subject to change or alteration, except by a subsequent act passed upon by the qualified voters of Toledo. The ordinance provides for a bond issue, which, in my opinion, received sufficient votes to carry, and the additional leigislation is necessary by Council providing for the quality and character of a franchise to be given to the holders of the bonds in case of forfeiture.

"Such legislation should be enacted so that when the property is to be transferred the bonds may be issued and sold and the money turned over to the holders of the property, as an act simultaneous with the transfer of the property.

"In the event the city should purchase the existing properties a valuation should be had of them, the amount determined upon and the bonds placed upon the market and bids received on the same, subjecting their transfer to the condition that the property be taken over. Should condemnation proceedings be resorted to the city may elect to take the property within six months from date of finding of value, and in that period of time a market could easily be found for the bonds and for the sale determined upon and the property acquired at the same time the bonds are transferred.

"It is my opinion that this legislation by the electors is in all respects legal and binding upon the city of Toledo in even a greater degree than an act of Council and is in compliance with the statutes and constitution of the State of Ohio."

In connection with the statement the city clerk presented the results of the election, properly certified by members of the board of elections. They show that 10,597 votes were cast in favor of the ordinance and 9,409 against it.

A meeting of the franchise committee was scheduled for the evening of Sept. 30.

A resolution to employ former City Solicitor Cornell Schreiber to aid the present city solicitor in the franchise fight was placed on the table by the City Council without comment at the regular meeting on the evening of Sept. 28. The idea of having Mr. Schreiber identified with the case arose from the controversy between him and the Federal Court over a statement made by Mr. Schreiber following the recent injunction decision.

The hearings in the contempt proceedings against the three men connected with the Toledo Newspaper Company and the Toledo *News-Bee* were begun on Sept. 22 before Judge Killits, who gave his reasons for dismissing Harry J. Howard, managing editor of the paper. He said Mr. Howard was merely an employee of the paper and had to follow the wishes of his superiors. During the hearing Judge Killits made it plain that he brought the proceedings not because of personal criticism of himself, but because the court should be allowed to conduct its hearings and render its decisions without annoyance and without an attempt to influence people against orders of the court.

J. W. Curts, attorney representing the newspaper, argued that the matter contained in the articles and editorial did not constitute contempt and that a newspaper has a right to criticise the courts and their decisions. He said the court was endeavoring to abridge the rights of the press and to establish a censorship. Mr. Curts said that the Toledo *News-Bee* had done a glorious work and that Editor Cochran should be commended for the part he played in it.

On Sept. 23 Judge John M. Killits of the Federal Court, sitting in the contempt proceedings against Negley D. Cochran and E. B. Conliss, the editor and business manager respectively of the Toledo *News-Bee*, said that in case he decided to strike from the court's records the amendment and supplement to the original order of citation, he might call in another judge to hear the case. Counsel for the men were granted four weeks in which to file briefs and Judge Killits will reply in writing three weeks later. His decision in regard to who shall hear the case will probably not be announced until that time. Attorney Charles S. Northup, representing the *News-Bee* and its editor and business manager, argued that the court had no right to issue a supplemental order, as the contempt proceedings are of a criminal nature, and supplemental or amended orders cannot be issued in criminal cases. The attorney contended that Negley D. Cochran should be discharged since it was an order of this kind, issued on Sept. 17, that brought him into the case. He contended that the court could not punish Mr. Cochran and the *News-Bee* for inciting resistance to its order even if the incitement resulted in resistance. Judge Killits said that if the attorney insisted upon striking out the amendment and supplement, it would be granted, but that unless Mr. Cochran voluntarily appeared the court would have to serve the respondents with the amended and supplemental order.

Henry L. Doherty went to Toledo on Sept. 22 at the request of the franchise committee of the City Council, but it seems that the committee was not prepared to proceed with negotiations at once. On his departure for New York Mr. Doherty announced that he would return on Sept. 29 prepared to proceed at once with the franchise negotiations.

JOHN F. WALLACE ON TERMINAL ELECTRIFICATION

John F. Wallace, chairman of the railway terminals commission of Chicago, returned to that city on Sept. 18 from a European tour. Mr. Wallace was quoted as follows in an interview:

"The day of steam as a motive power in internal city traffic is gone or is rapidly going. The terminals commission has before it a dozen or more matters relating to electrification which were referred to it by the City Council. The first step that must be taken is to work out a rearrangement of railroad tracks so as to reduce the number and provide for an interchange of facilities. Here in Chicago there are numerous instances where railroads parallel and cross each other so as to double and triple the amount of necessary trackage. An improvement in the present track situation is bound to come, and that will make possible a change in motive power. American cities are far ahead of Europe in the electrification of railroad terminals, though London and Paris are using electric motive power for a few suburban lines. But there is no development abroad that can be compared with the electrification of the New York, New Haven & Hartford, the New York Central and the Pennsylvania railroads in New York."

Mr. Wallace said the railway terminals commission would soon begin active work. The first matter to come before the commission probably will be the request of the Chicago &

Western Indiana Railroad for an extension of the terminal facilities of the Dearborn Street station. In this connection Mr. Wallace said:

"This request involves the whole terminal problem with respect to the railroads using the Illinois Central, the La Salle and the Dearborn stations. In handling this problem some way must be found to confine railroad occupancy to private property and thus open up more north and south and east and west streets. In London the railroads are compelled to keep the highways open, and we should follow the same policy here."

NEW YORK SUBWAY CONTRACTS AGGREGATING $140,516,385 AWARDED

The city of New York on Sept. 1, 1914, had outstanding or completed contracts for rapid transit railroad construction under the dual system agreements aggregating $140,516,385, of which $69,462,918 is on lines to be operated by the Interborough Rapid Transit Company and $71,073,466 on lines to be operated by the New York Municipal Railway Corporation.

During the week ended Sept. 26 the Public Service Commission for the First District of New York awarded the contract for the construction of Section No. 2 of Route No. 48, the William Street part of the Park Place, William and Clark Street subway, for operation by the Interborough Rapid Transit Company, to Smith, Hauser & MacIsaac, Inc., the lowest bidders, for $2,254,670. Section No. 2 extends from a point near Beekman Street, southward under William Street and eastward under Hanover Square, to a point about opposite the easterly building line of Pearl Street. The plans call for a two-track subway, and the work must be completed within twenty-eight months from the delivery of the contract.

Chairman Edward E. McCall of the commission is urging Congress to pass the appropriation for the improvement of the East River channel, contained in the pending River and Harbor bill. The government proposes to deepen the channel and to blast away part of Coenties Reef. One of the new rapid transit tunnels under the dual system will pass through this reef and the engineers of the commission fear the effects of blasting upon the tunnel after it is completed.

CLEVELAND'S LABOR PROBLEM

W. D. Mahon, president of the Amalgamated Association of Street & Electric Railway Employees, and a committee from the local branch of the union at Cleveland, Ohio, called on John J. Stanley, president of the Cleveland Railway, on Sept. 29 and discussed the demands that have been made upon the company for increased wages and longer work-day for the tripper men. Mr. Stanley said that he was unwilling to make any change in his original proposition of a minimum day of five hours, with 27 cents an hour for men in the service less than a year and 31 cents for those who have been in the company's employ more than a year. This change of hours and increase in wages, he told them, will cost the company $152,000 a year. The men asked Mr. Stanley if he would be willing to consider a seven-hour minimum instead of an eight-hour day, but he told them that his original proposition was the best that could be made. A meeting of the men was then called for the evening of Oct. 3.

Councilman Meyers, of Cleveland, Ohio, has brought up his resolution providing for a rule that cars shall stop on the near side at all street intersections and insists that the street railway committee of the Council act upon it or allow Council to take it up direct.

People served by the Clark Avenue cars have signed a petition asking that these cars be run alternately on West Fourteenth and West Twenty-fifth Streets in order to improve the service. Peter Witt, street railway commissioner, is in favor of looping the West Fourteenth Street cars at the Holmden Avenue carhouse as a solution of the problem.

W. F. Thompson, president of the City Council, has announced that he will offer a resolution at the next meeting, asking for an investigation of the cost and feasibility of building an elevated system. His idea is to keep such lines off the main streets and adopt the Berlin ornamental idea. He also wishes to investigate the advisability of making this a municipal system.

JOPLIN & PITTSBURG STRIKE SETTLED

The Joplin & Pittsburg Railway resumed operations on the afternoon of Sept. 24, the eightieth day of the strike. Practically all the old men went back to work. Cars were run over all the city and interurban lines, and regular schedules, it was announced, would be resumed during the week commencing Sept. 27. The agreement signed by the company and the men included all the subjects of difference as to working conditions, and is to run for three years. The contract provides for the course through which complaints shall run and for permanent arbitration. The matter of wages is to be arbitrated. The men are to select for this board a member of the utility commission of Kansas or Missouri, the company is to select a member of the board from the membership of these two commissions, and the two arbitrators so selected are to name the third member of the board. The decision of the arbitrators on the subject of wages will automatically become a part of the contract already signed. While the strike was in progress the interurban traffic, particularly between the mines and the homes of miners, was cared for by steam railroads, which ran special trains. The three-year contract is automatically renewed for another three years at its expiration unless one side or the other gives ninety days' notice of a desire to change any of its provisions.

INDIANAPOLIS LABOR SITUATION

Court Order Sought to Restrain Indianapolis Union From Disregarding Arbitration Award

A temporary restraining order to enjoin officials of the Amalgamated Association of Street & Electric Railway Employees of America from calling a strike on the city lines of the Indianapolis Traction & Terminal Company was granted on Sept. 23 by Judge Albert B. Anderson of the United States Circuit Court at Indianapolis, Ind., on petition made by the Guaranty Trust & Safe Deposit Company, Philadelphia, trustee of the mortgage securing the bonds of the Indianapolis Traction & Terminal Company.

Attorneys and representatives of the plaintiff appeared before Judge Anderson and declared that at a meeting of the executive committee of the union it was planned to call a mass meeting of men who were members of the union, after midnight on Sept. 23, ostensibly as a "smoker," but that at the meeting officials of the Amalgamated Association and other labor organizations would make speeches inciting the men to strike and violate the award of the Public Service Commission in the recent arbitration. The bill of complaint shows that the majority of the employees are non-union men, and have signed a working agreement with the company which would be violated if these men should be forced or induced to join in a strike. The complaint further shows that as a part of the general conspiracy five shares of stock of the Indianapolis Street Railway were purchased by the labor organization and held in the name of William Dobson, secretary of the union of bricklayers, masons and plasterers; that at the time of the strike in November, 1913, suit for a receiver was brought in the name of Dobson against the Indianapolis Traction & Terminal Company for the ostensible purpose of cancelling its lease of the property of the Indianapolis Street Railway for failure to operate the same during the time of the strike, the real purpose being to attempt to secure the appointment of a receiver who would be favorable to the union and to operation on the closed shop principle, and that since that time this suit has been kept pending in the Marion Circuit Court for the real purpose of furthering the ends of the union in case of a strike.

The local attorney for the Amalgamated Association was ordered to appear before Judge Anderson. He insisted that the defendants had the right to violate the contracts set forth in the bill. The court then asked the attorney to give assurance that the contemplated strike alleged in the bill would not be ordered, and that then all action of the court should be held in abeyance until the matter could be heard. The attorney for the organization declined to give such assurance, and thereupon Judge Anderson at once issued a restraining order enjoining all of the officials of the Amalgamated Association and other labor organizations, as well as each union and non-union car service employee of the company from causing, or attempting to cause a strike on the lines of the Indianapolis Traction & Terminal Company in violation of the award of the commission and the working agreement between the company and its employees, and restraining all the defendants from gathering in the streets or in any way attempting to interfere with the operation of the business of the company. The members of labor organizations who were parties to the attempted suit for receivership were also enjoined in the order of the court.

When the mass meeting of the employees was called to order at 1:30 a. m., Sept. 24, a United States marshal and deputies entered the hall and read the order of the court to the union labor officials and men assembled for the meeting.

On Oct. 2 the court was to hear evidence and determine whether a temporary injunction should be granted.

TORONTO PURCHASE OFF

Prior to the commencement of business at the meeting of the City Council of Toronto, Ont., on Sept. 21, Mayor Hocken announced that in consequence of the changed conditions in the financial world brought about by the war all negotiations for the purchase of the properties of the Toronto Railway and the Toronto Electric Light Company had been discontinued. He later laid on the table a copy of the draft agreement for the proposed purchase, which had been approved by counsel on both sides. He also called attention to the fact that the increase in the earnings of the companies had not been as great during the past few months as had been expected. He pointed out that although the purchase scheme would not be carried out, the Council should proceed without delay to improve the transportation facilities of all the outlying districts, intimating that a solution of the problem might be found by the establishment of a bus service. No resolution was introduced in connection with the Mayor's message.

MISSOURI PUBLIC SERVICE VALUATIONS

The following table shows the comparative values of the different classes of properties in 1913 and 1914, as fixed by the Board of Equalization of Missouri for taxation purposes:

	1913	1914
Steam railroads	$133,687,203	$137,549,729
Electric and street railways	35,472,857	37,509,050
Telephone lines	11,083,455	11,602,309
Telegraph lines	2,724,959	2,701,909
Bridges	5,799,000	5,811,000
Total	$188,767,475	$195,172,998

Bus Franchise Desired in Philadelphia.—The United Traction Improvement Company, of which W. C. McIntire is president, has applied to the Councils of Philadelphia for franchises to operate gasolene-electric buses, charging a 5-cent fare and running every three minutes over three routes in north and west Philadelphia. The directors of the company are W. C. McIntire, V. H. Conkel, W. W. Gibbs, C. V. Mannering, G. G. Wigginton, John Monahan and Harry S. Calvert, receiver of the Mercantile Trust Company, Pittsburgh, Pa.

Waterloo-Cedar Rapids Line Open for Service.—The Waterloo, Cedar Falls & Northern Railway, which has had a 60-mile extension between Waterloo and Cedar Rapids, Ia., under construction for the last year and a half, opened the line to regular service Sept. 15. While this extension is not yet completed in every detail, the main track and the overhead were completed early in September. The initial schedule provides for thirteen trains each way daily, alternating local and limited. Local trains make the 60-mile run in two hours and fifty minutes, and the limited trains in two hours and ten minutes.

San Francisco's Municipal Railway Extension.—Specifications for the San Francisco (Cal.) Municipal Railway's California Street line have been prepared by the city engineer and adopted by the Board of Works, but Assistant City Engineer Ransom told the supervisors that, as this line would cost $127,500 and the available balance remaining in the bond fund was only $35,500, enough bonds to make up the difference would have to be sold before a contract for construction could be let. The sales of the $3,500,000 issue already made total $2,650,000, and the contracts so far awarded call for about $2,615,000, according to Mr. Ransome.

Mr. Whitridge on the War.—Frederick W. Whitridge, president of the Third Avenue Railway, New York, returned to New York from Europe on the *Adriatic* on Sept. 25. He said he had gleaned from the opinions of well-informed persons abroad that the conflict could not be terminated in less than twelve months. Mr. Whitridge said his son is with the Foreign Legion of the French army, but thus far has not been ordered to the front. In this connection he was quoted as follows: "If I were his age I would be impatient to get into action. The war will be a long one, but there can be only one finish, and that is victory in every detail for the Allies."

Seattle Negotiations Abandoned.—Negotiations looking to the purchase of the Seattle, Renton & Southern Railway by the city of Seattle as a link in the existing municipal lines have come to an abrupt end, six members of the Council having agreed to abandon the plan of making an offer for the property. They agreed, however, to put the offer up to a vote of the people if the receivers of the line made an offer to the city similar to the one made by the city and acceptable to the railroad. As the receivers have stated that they will never consider another offer made by the city nor make an offer to the city, the deal of the purchase of the Seattle, Renton & Southern Railway by the city is regarded as being off.

Public Service Railway Baseball.—The second game of the series of three games between the teams representing the railway department and the electrical department of the Public Service Corporation of New Jersey was played at Hilton on Sept. 21. The electric team won by a score of 6 to 4. This gave them the championship. On Sept. 23 a game was played between the Public Service representatives and the champions of the Brooklyn Rapid Transit System. This was also decided at Hilton and the Public Service men won by a score of 10 to 9. The fans from Brooklyn were carried from Jersey City to the grounds at Hilton in special cars. It was expected that a return game would be played between the two teams at Bedford Park in Brooklyn on Oct. 1.

The New Haven Investigation.—The first step in the renewed criminal inquiry into the affairs of the New York, New Haven & Hartford Railroad was taken on Sept. 28, when a special Federal Grand Jury was sworn in by Judge Mayer at New York. This was in accord with the recent suggestion of President Wilson that the criminal investigation should not be dropped. The Grand Jury was impaneled by Assistant District Attorney Stephenson. Assistant Attorney-General Swacker, who, with James W. Osborne, will be in charge of the government's case, was present. It is expected that the decree for the dissolution of the New Haven and Boston & Maine lines will be brought before the Federal District Court in the next week or two. The railroad company will agree to it, and the proceedings will be merely formal.

Japanese Engineer Studying Turbine Plants.—K. Shiraki, hydroelectric engineer, associated with the Kinugawa Hydroelectric Company, which supplies power from a plant on the Kinugawa River to the Tokyo (Japan) Municipal Railway, is visiting America to investigate steam-turbine plants in this country. The company that Mr. Shiraki represents is planning to erect a steam-turbine plant as an emergency addition to its present hydroelectric station, which was built about three years ago. For this purpose Mr. Shiraki plans to purchase steam turbine and condenser equipment in the near future. He has already visited a number of American cities, including Pittsburgh, Buffalo, Schenectady, Boston, Washington, Baltimore and Philadelphia. It is expected that he will arrive in New York on Oct. 4, to remain about three weeks. Mr. Shiraki has recently ordered through Mitsui & Company, New York, exporters, three 1500-kw and three 1000-kw General Electric frequency changers, with switchboard apparatus, for the Kinugawa River power house.

Financial and Corporate

RECENT FINANCIAL TENDENCY

On Sept. 25 the governors of the New York Stock Exchange, acting in conjunction with dealers in unlisted bonds and stocks, announced that private purchases and sales of unlisted securities would be permitted on moderate concessions from prices of July 30. Up to that time the rule had been stringently enforced against the purchase or sale of stocks beneath the closing level of prices on July 30. The representative of the New York Curb Market Association announced the same day that members wishing to buy or sell any stocks not listed on the New York Stock Exchange must submit their proposed transactions to the committee on unlisted stocks and act in accordance with the regulations of that committee. Bond trading in New York broadened during the week. The New York City new 6's of 1917 sold at practically 102, with a steady demand. While nothing official has been announced, the steps so far taken toward the resumption of trading are generally believed to indicate that the exchange will be opened by Nov. 1. During the week the organization of the $100,000,000 gold fund to be used for easing the foreign exchange market was practically completed, and on Sept. 30 the New York gold pool committee shipped $10,000,000 in gold to Ottawa for the account of the Bank of England and began selling London exchange against the amount on Oct. 1. Further shipments of gold will be made to Ottawa from time to time as the committee may deem expedient. On Sept. 30 foreign exchange rates declined. At the close of the day demand sterling was quoted at $4.97¼, cables at $4.98¼. This was regarded as an effect of the gold pool. On the whole, trade conditions are considered more favorable. A particularly important recent development is the announcement that the New York Central & Hudson River Railroad will again enter the short-time note field with an offering of $20,000.000 of notes to mature in six months and another $20.000,000 to mature in a year. Both issues are to be dated Oct. 1, and carry interest at 5 per cent. The railroad has asked J. P. Morgan & Company to manage the syndicate, which will buy the notes on a 7 per cent basis, the date of offering and the price to be decided later.

CHANGES IN NEW HAVEN DIRECTORATE

William Rockefeller, George F. Baker, Charles F. Brooker and James S. Elton resigned as directors of the New York, New Haven & Hartford Railroad on Sept. 29. The resignations were accepted, and J. Horace Harding was made a director. It was announced at the same time that the New Haven board, which has been reduced to twenty members, would be cut to seventeen if the stockholders at the annual meeting on Oct. 28 approved a recommendation to that effect to be made by the board. All four of the men who retired were directors under the Mellen régime. J. P. Morgan and John L. Billard resigned some time ago. William Rockefeller had been a member of the board for many years. Besides his Standard Oil interests, he is the dominant factor in Amalgamated Copper and a director in many banks, railroads, and gas and electric companies. George F. Baker had also been a director for years. He is chairman of the First National Bank board, of which he was long president, and is a director in railroad, banking, public utility and manufacturing corporations. Charles F. Brooker is president of the American Brass Company and a director of several banks and of the International Smelting & Refining Company and the Westinghouse Electric & Manufacturing Company. James S. Elton, of Waterbury, has large and varied interests in Connecticut.

J. Horace Harding, the new director, is a member of Charles D. Barney & Company and a director in the American Express Company, the Amalgamated Copper Company, the American Beet Sugar Company, the Brooklyn Rapid Transit Company, the Columbia Trust Company, the Metropolitan Trust Company, the New York Municipal Railway Corporation, the Public Service Corporation of New Jersey, the Southern Pacific Company, the Tobacco Products Corporation, the Wabash Railroad, and a number of other companies.

ANNUAL REPORTS

Pacific Gas & Electric Company

The condensed comparative statement of income, profit and loss of the Pacific Gas & Electric Company, San Francisco, Cal., for the calendar years 1913 and 1912 follows:

	1913	1912
Gross earnings	*$15,869,006	$14,473,525
Deduct:		
Maintenance, operating expenses, taxes and reserves for uncollectible accounts, etc.	9,331,207	8,431,561
Net earnings from operations	$6,537,799	$6,041,964
Add:		
Profit on merchandise sales and miscellaneous income	333,332	271,126
Total net income	$6,871,131	$6,313,090
Deduct:		
Interest on funded and floating debt	3,902,045	3,568,943
Balance	$2,969,086	$2,744,147

*Includes $261,733 in litigation, for which a reserve has been created from the surplus account.

The increase in gross operating revenues of the company was well distributed geographically and also well divided among the different branches of the company's business. The increases in the various departments were as follows: Electric, $558,211; gas, $741,730; railways, $25,725; all other, $69,814; total, $1,395,480. The total increase, including miscellaneous income, was $1,457,685. Maintenance, operating expenses, taxes, etc. (including the entire extraordinary outlay occasioned by the strike of employees) increased $899,645. The net income increased $558,040. The influence of voluntary rate reductions which affected 1912 by more than $1,000,000 was still felt in the earlier months of 1913. In the first nine months of the year gross revenue increased $937,711, with an increase in net of only $140,332, whereas in the last three months the gross revenue increased $519,974 and net revenue $417,708.

After the payment of 6 per cent dividends on preferred stock amounting to $600,000 and 1¼ per cent on the common stock amounting to $398,848, the entire balance, after establishing a reserve of $261,733 in connection with rate suits still pending, was transferred to the depreciation reserve. Against this was charged $518,568 for current depreciation. An extraordinary charge of $1,299,848 was made to cover the elimination from property schedules of all obsolete, abandoned and unused plant. The balance remaining to the credit of the depreciation reserve was $2,433,493. On Dec. 31, after charging off all ascertained losses, the balance to the credit of the insurance and casualty reserve was $52,353 and to the credit of the reserve for bad and doubtful debts $34,162.

The net earnings of the company after bond interest have aggregated $21,781,471 in the eight years since its organization. Of this amount only 21 per cent ($4,622,103) was paid out in cash dividends. The remaining 79 per cent ($17,159,368) was reinvested in property, applied to the reduction of funded debt or expended for other corporate purposes. The expenditures for net plant additions (cost less value of property replaced) amounted to $9,091,192 during 1913. This compares with expenditures of $7,821,712 in 1912 and $6,802,158 in 1911. In the eight years since organization $8,931,444 was expended for maintenance, an average of $1,116,430 per year, in addition to which the cost of replacements was met from earnings.

The street railway system owned by the Pacific Gas & Electric Company is the Sacramento Electric, Gas & Railway Company. The progress of this company from 1906 to 1913 is shown by the accompanying table:

Year	Miles of Street Railway Track	Cars Owned	Total Passengers Carried	Car Mileage	Car Hours	Gross Revenue
1906	27.6	34	7,164,659	1,591,324	204,148	$355,916
1907	28.9	44	8,655,918	1,803,742	234,829	431,800
1908	28.9	45	8,476,369	1,731,311	227,868	414,326
1909	34.1	51	9,466,704	1,895,766	242,194	452,396
1910	35.9	52	10,691,475	2,136,494	269,865	509,152
1911	38.9	62	11,464,696	2,279,998	293,107	533,520
1912	40.0	62	11,926,098	2,301,342	276,438	547,187
1913	42.0	60	12,508,744	2,469,745	301,930	572,913
Increase in seven years	14.4	26	5,344,085	878,421	97,782	$216,997
Percentage increase	52	76	75	55	48	61

New York Consolidated Railroad

The New York (N. Y.) Consolidated Railroad has reported to the Public Service Commission for the First District the result of its business for the first year of temporary operation, namely, from Aug. 4, 1913, to July 31, 1914. The system was operated under the terms of the dual system contract made by the city with the New York Municipal Railway Corporation, of which the New York Consolidated Railroad is the operating company, and it included the two westerly tracks of the Centre Street Loop, the first section of the new subway to be opened to the public, and the old elevated lines. A condensed statement of the total earnings and expenses for the year follows:

Revenue	$8,677,417
Maintenance (15 per cent depreciation included)	$1,302,770
Other operating expenses	3,367,805
Rents not included in operating expenses	86,102
Taxes	584,727
Total	$5,340,405
Operating income	$3,337,012
Company's preferential ($3,500,000 per annum to represent return on property at date of contract)	3,471,774
Amount due company on preferential	$134,762
Interest and sinking fund on company's new investment in operation	31,321
Interest (4½ per cent) and sinking fund (1 per cent) on city's investment in operation	363,895
Total deficit	$529,979

By the terms of the dual subway contracts the earnings of the elevated railroads throughout Brooklyn operated by the New York Consolidated Railroad and those of the new Centre Street Loop subway were pooled and made subject to certain deductions. These included first the payment of operating expenses and taxes, next the so-called preferential payment to the operating company of $3,500,000 per annum as a return on its property investment at the date of the contract, and finally the interest charges on the company's and the city's investments. The preferential payment is really profit, for it is based upon the estimated profit made by the company for the two years preceding the beginning of operation. The earnings of $8,677,417 paid not only the increased cost of operation of the loop subway but also the entire operating expenses of the whole system, amounting to $5,340,405, and left an operating income of $3,337,012, within $134,762 of paying the full amount of the company's preferential of $3,500,000.

With allowances for the interest and sinking fund charges upon moneys invested by both the company and the city, there was a deficit of $529,979. Of this $363,896 was for interest and sinking fund payments upon money invested by the city in the construction of the Centre Street Loop subway, and $31,321 for interest and sinking fund payments on the money invested by the company in equipping the subway. According to the terms of the dual system contracts, however, the unpaid interest on the company's bonds will accumulate until the surplus profits are large enough to meet them, while the unearned interest on the city's investment will be included in the cost of construction.

For four months, namely, April, May, June and July of this year, the earnings were large enough to provide for both the preferential and the company's interest charges. In May and July the surplus was large enough also to cover the interest due the city. Next year, when the other two tracks in the loop subway will be opened, the commission expects a marked improvement over the results of the first year's operations.

WESTCHESTER STREET RAILROAD DECISIONS

New York Upstate Commission Straightens Out Capitalization of Subsidiary and Authorizes Bond Issue for Improvements

The Public Service Commission for the Second District of New York has issued an order straightening out the capitalization of the Shore Line Electric Railway, a subsidiary of the Westchester Street Railroad, White Plains, N. Y., and reducing that capitalization to the real value of the property. According to the commission, this act is a result of the sale of the road to the New York, New Haven & Hartford Railroad at a price which the commission's experts have characterized as several times the real value of the road. The excess value was created through the fight between the New Haven line and the Third Avenue Railway, New York, for the old White Plains, Mamaroneck & Tarrytown Railway. This was divided into three parts at a receiver's sale, the New York, New Haven & Hartford Railroad buying two of these at big prices and the Third Avenue Railway the other. The Third Avenue line, finding that it could not compete with the New Haven road on this basis, sold out its interest to its rival, and the Shore Line Electric Railway was thereupon organized as a part of the Westchester Street Railroad.

The present decision of the commission follows the decision of the Court of Appeals in the Westchester Street Railroad case. The capitalization is fixed at the present real value of the property, as determined by the engineers of the up-State commission and E. G. Connette, at the time engineer for the first district commission. It is far less than the price originally paid for the property. By the terms of the order the Shore Line Electric Railway is authorized to issue $50,000 of capital stock at not less than par and the New York, New Haven & Hartford Railroad is authorized to acquire and hold the same, in accordance with permission granted in 1913.

The commission also authorized the Westchester Street Railroad to execute a mortgage to secure an issue of $2,000,000 of first mortgage 5 per cent thirty-year gold bonds and to issue thereunder bonds amounting to $386,000. The bonds cover the following improvements, some of which have already been made: Overhead work, $49,485; track repair, $112,545; power plant equipment and transmission line, $43,900; new cars and equipment, $60,200; new carhouses and shops, $115,000; repairs to carhouses and power stations, $3,016, and miscellaneous equipment, $1,854. This order amends those entered on April 24 and June 13, 1912.

Alton, Jacksonville & Peoria Railway, Alton, Ill.—The Alton, Jacksonville & Peoria Railway has recently made application for permission to issue $750,000 of stock and $500,000 of bonds. The matter has been taken into consideration by the Illinois Public Service Commission. A legal point has been raised that the railway was in the hands of a receiver for two years before it was sold to its present owners and that it is doubtful whether the commission has jurisdiction over an agreement made before it was organized and now about to be consummated. The foreclosure and sale of this road were noted in the ELECTRIC RAILWAY JOURNAL of April 11 and June 6.

American Public Utilities Company, Grand Rapids, Mich.—The board of directors of the American Public Utilities Company on Sept. 28 declared the regular quarterly dividend of 1½ per cent on its preferred stock, payable on Oct. 10 to stockholders of record on Sept. 30. In view of the present general financial depression, however, the board passed the usual quarterly dividend on the common stock. At the beginning of the European war the company had undertaken certain large construction work, particularly at Indianapolis. The board was not certain that these construction operations could be carried forward without using funds available for dividends, and after action on the matter had been deferred until Sept. 25 the above decision was reached.

American Water Works & Electric Company, Pittsburgh, Pa.—The American Water Works & Electric Company, Pittsburgh, Pa., the successor to the American Water Works & Guarantee Company, has decided not to begin the payment of dividends on its preferred stock at the present time. In a circular addressed to the stockholders the directors state that the gross and net earnings of the subsidiary water companies have increased and are in excess of the estimates made at the time of the reorganization, but that in view of existing financial conditions and the difficulty of securing funds for construction purposes by the sale of subsidiary securities, it is deemed inadvisable now to commence the payment of dividends.

Aurora, Elgin & Chicago Railroad, Wheaton, Ill.—The Aurora, Elgin & Chicago Railroad has passed its usual quarterly dividend of three-quarters of 1 per cent on the common stock, but declared its regular quarterly dividend of 1½ per cent on the preferred stock, payable on Nov. 1 to stock of record on Sept 23. Vice-President E. C. Faber says that the common dividend was earned but the directors suspended payment in view of the existing financial conditions and the necessity of meeting capital requirements out of income.

Birmingham, Ensley & Bessemer Railroad, Birmingham, Ala.—The independent bondholders protective committee, of which S. H. Cunningham is chairman, as noted in the ELECTRIC RAILWAY JOURNAL of Sept. 19 and 26, has requested the deposit of the first mortgage thirty-year 5 per cent bonds of the Birmingham, Ensley & Bessemer Railroad with the American Trust Company, Boston. The bondholders may also deposit their holdings with the Riverside Trust Company, Hartford, Conn.; the Columbus Trust Company, New York; the West End Trust Company, Philadelphia, Pa.; the Maryland Trust Company, Baltimore, Md.; the Louisville (Ky.) Trust Company; the First National Bank, Chattanooga, Tenn., and the Traders National Bank, Birmingham, Ala. If the committee adopts a plan of reorganization, depositors will be given thirty days to withdraw their bonds after payment of their pro rata share of the expenses.

Columbus, Urbana & Western Electric Railway, Columbus, Ohio.—L. P. Stephens, general manager of the Columbus, Urbana & Western Railway, says that the statement in regard to the ownership of the bonds of that company by the Columbus Railway & Light Company, published in the Columbus papers of Sept. 5 and 6 and noted in the ELECTRIC RAILWAY JOURNAL of Sept. 19, was incorrect. Mr. Stephens explains the present status of the company as follows: "The affairs of the company having been satisfactorily adjusted there was no longer any necessity for continuing the receivership, and upon agreement with the owners of the property I applied to the court for permission to file a final accounting and turn the property over to the company. There was no statement made before the court that any company owned the outstanding bonds of the Columbus, Urbana & Western Electric Railway. The Columbus Railway & Light Company does not now own and never has owned any of the securities of the Columbus, Urbana & Western Electric Railway, for the entire bond and stock issues are held by seven individuals, none of whom have any interest in the Columbus Railway & Light Company."

Lehigh Traction Company, Hazelton, Pa.—In a recent letter from N. C. Yost, treasurer of the Lehigh Traction Company, to holders of the $500,000 of the company's first mortgage 5's, it was stated that in order not to subject the bondholders to further inconvenience or delay Alvan Markle, president of the company, had volunteered individually to purchase all the coupons which matured on June 1, 1914, if presented on or before Nov. 1 to the Markle Banking & Trust Company. Mr. Yost said that the company had resumed operations cut off by the recent strike and the traffic was approaching its normal volume. The demands of operation, however, required the resources of the company to be utilized in that direction, so that the company was still unable to meet the interest which matured on June 1. A protective committee of first mortgage bondholders, composed of W. Frederick Schneider, George P. Bissell and Henry M. Watts, in a circular letter dated Sept. 23 advised the bondholders to accept Mr. Markle's proposition in view of the present financial conditions.

Ohio River Electric Railway & Power Company, Pomeroy, Ohio.—Application has been made to the Ohio Public Utilities Commission by the Ohio River Electric Railway & Power Company, a Delaware corporation, for permission to purchase from Richard C. Ellis an electric railway line between Middleport and Hobson. The consideration is the payment of $30,000 and the assumption of a debt of $9,161 against Mr. Ellis. At the same time an Ohio corporation, the Ohio Electric Railway & Power Company, filed an application for permission to purchase the original company's property, consisting of an electric line between Middleport and Racine and the one to be acquired between Middleport and Hobson. The Ohio company desires to increase its capital stock from $10,000 to $500,000. Of this $150,000 of preferred and $150,000 of common stock would be paid to the Delaware corporation for its property.

Puget Sound Traction, Light & Power Company, Seattle, Wash.—The directors of the Puget Sound Traction, Light & Power Company passed the dividend on the $18,557,800 of common stock normally payable on Oct. 16. From April, 1912, to July, 1914, 1 per cent was paid quarterly. According to an official statement issued by the company, during the last two years the Puget Sound district has suffered from the general business depression prevailing throughout the Pacific Coast states and British Columbia. It was hoped that benefits would arise from the opening of the Panama Canal and the expected development of Alaska, but these improvements have been retarded by the foreign war. The company has cut operating expenses as far as possible without injuring the service and has stopped all new construction, except such as was nearly finished or required by its franchises. The company has a substantial cash balance and no floating debt, but on account of the impossibility of estimating how long the present depression will continue, the directors deemed it advisable to conserve the company's resources. As there was, however, an ample margin over the preferred dividend, the directors declared the regular quarterly dividend of 1½ per cent on the cumulative preferred stock, payable on Oct. 15.

Quebec Railway, Light & Power Company, Quebec, Que.—According to the *Monetary Times*, the affairs of the Quebec Railway, Light & Power Company have not been growing any worse since the present exceptional conditions developed. While the war has affected earnings in the majority of cases adversely, it is believed that the opposite will be true in the case of this company. The Valcartier camp, with from 20,000 to 25,000 troops, is within a short distance of the railway, and the company's earnings will be increased both through a larger passenger traffic and through contracts for lighting the camp and pumping water to it.

Seattle, Renton & Southern Railroad, Seattle, Wash.—As a preliminary move to the closing out of the receivership of the Seattle, Renton & Southern Railroad and the sale of its franchises, good-will and property to the highest bidder, Judge A. W. Frater has taken under consideration creditors' claims amounting to $1,461,000. Some of the claims are being opposed by the receivers of the company, among such being the mortgage and collateral trust notes of $1,261,000 in the hands of Peabody, Houghteling & Company, Chicago, and numerous individual holders of small amounts. There is $825,000 of 5 per cent mortgage bonds with $100,000 of interest overdue, together with $336,000 of 5 per cent collateral trust notes, which are alleged to have been executed on usurious terms. It is contended that the discount on the bonds and notes exacted by the purchasers raised the net interest to a fraction above 7 per cent. Claims amounting to approximately $200,000 were filed by creditors for supplies, power, etc.

United Railways Investment Company, San Francisco, Cal.—In a circular to the stockholders dated Sept. 22, Mason B. Starring, president of the United Railways Investment Company, called attention to the script dividend recently announced by the Philadelphia Company, Pittsburgh, Pa., as noted in the ELECTRIC RAILWAY JOURNAL of Sept. 26. Mr. Starring stated that until Dec. 31 his company would offer to its stockholders an opportunity to purchase a portion of such script, subject to prior sale at par and interest from Nov. 2. The script is redeemable on or before eighteen months from Nov. 2, and bears interest until date of redemption at the rate of 7 per cent per annum. The interest on the collateral trust sinking fund 5 per cent gold bonds of the United Railways & Investment Company (Pittsburgh issue), due Nov. 1, will be paid in cash as usual.

West Penn Traction Company, Pittsburgh, Pa.—The consideration of the quarterly dividend of 1½ per cent due on April 15 upon the $1,625,000 of preferred stock of the West Penn Traction Company has been postponed until the present outlook is brighter. The resolution of the executive committee was substantially to the effect that on account of the present business depression and the large cash requirements for new construction in 1914 out of both its construction fund and earnings, it was deemed advisable to pass the preferred dividend, although it had been amply earned.

DIVIDENDS DECLARED

Athens Railway & Electric Company, Athens, Ga., quarterly, 1¼ per cent, preferred.

Aurora, Elgin & Chicago Railroad, Wheaton, Ill., quarterly, 1½ per cent, preferred.

Cincinnati (Ohio) Street Railway, quarterly, 1½ per cent.

Columbia Railway, Gas & Electric Company, Columbia, S. C., quarterly, 1½ per cent, preferred.

Halifax Electric Tramway Company, Ltd., Halifax, N. S., quarterly, 2 per cent.

Manchester Traction, Light & Power Company, Manchester, N. H., quarterly, 2 per cent.

Memphis (Tenn.) Street Railway, quarterly, 1¼ per cent, preferred.

Mohawk Valley Company, New York, N. Y., quarterly, 1½ per cent.

Philadelphia Company, Pittsburgh, Pa., quarterly, 1¾ per cent, common, payable in script; 3 per cent, cumulative preferred.

Puget Sound Traction, Light & Power Company, Seattle, Wash., quarterly, 1½ per cent, preferred.

Ridge Avenue Passenger Railway, Philadelphia, Pa., quarterly, $3.

Scioto Valley Traction Company, Columbus, Ohio, quarterly, 1¼ per cent, first preferred; quarterly, 1¼ per cent, preferred.

South Carolina Light, Power & Railways Company, Spartanburg, S. C., quarterly, 1½ per cent, preferred.

Western Ohio Railroad, Lima, Ohio, quarterly, 1¾ per cent, first preferred.

Winnipeg (Man.) Electric Railway, quarterly, 3 per cent.

Traffic and Transportation

HEARING ON REVERE FARES

The Massachusetts Public Service Commission heard the petition of residents of Revere on Sept. 23 for a reduction of fares to 5 cents through the establishment of free transfers at Broadway and Park Avenue on the Bay State Street Railway, the petitioners desiring to be able to travel between points on Park Avenue and Lynn at the above rate. Henry E. Reynolds, assistant general manager of the company, pointed out that 90 per cent of the company's traffic on this line terminates or originates in Boston, to which a 5-cent fare applies. He further stated that in response to a former ruling of the Massachusetts Railroad Commission, workingmen's tickets good between 5:30 and 7:30 a. m., 4:30 and 6:30 p. m., and between 12 noon and 1 p. m. on Saturdays are sold at the company's office in Central Square, Lynn, and at the local carhouse, the ticket rate being 7 cents. Very little demand exists for these tickets. James F. Jackson, attorney for the company, pointed out that the Park Avenue line is one of several lateral routes in Revere and showed that if a [illegible]cent fare were established as petitioned the same privileges would logically follow on other lines, resulting in a 5-cent fare between all parts of Lynn and Revere Beach. On either of the company's main lines in Revere a 5-cent fare prevails, with a universal transfer at Lynn. The speaker could not recall a single instance of a 5-cent fare between two communities accompanied by transfers at both ends.

W. H. Day, traffic manager of the Lynn Chamber of Commerce, admitted that the establishment of a 5-cent fare on the Revere Beach line would be a hardship to the company. He suggested that the public would not press this issue, however, as a 5-cent fare exists on the Boston, Revere Beach & Lynn Railro[illegible]een Lynn and the beach. Chairman McLeod said that while certain people may be served by the latter road at the easterly end of Lynn where its terminal station lies, people from other sections of the city find it much more convenient to patronize the Bay State Street Railway, and that if the petition were granted he believed that the people of Lynn would appear before the commission inside of two weeks to ask for a 5-cent fare to the beach. Commissioner Clinton White brought out the point that if the petition were granted, with its resulting logical changes on other lateral lines, it would alter the through fare between Malden and Lynn and generally upset the existing schedules of rates between Lynn and its outlying districts. Chairman McLeod said that it is fair to make some distinction between pleasure riders and those who must use the lines daily in going to and from work. He felt that the very limited use of the 7-cent tickets between Park Avenue and Lynn indicates that the community is not materially tributary to Lynn from the standpoint of the workingman. The fact that a few persons may desire to go shopping in Lynn from these lateral lines does not make such lines tributary to Lynn to the extent that the company ought to be forced to adopt a special fare arrangement The hearing was then closed.

NEAR-SIDE STOPS IN LEXINGTON

After a fortnight's trial in Lexington, Ky., of the near-side, front-entrance plan of operating the city railway service, F. W. Bacon, vice-president of the Kentucky Traction & Terminal Company, made public a statement in part as follows:

"I hope the people of Lexington will be kind enough to give the new near-side street car system, recently inaugurated here, a fair trial without overmuch criticism. We are a public service company and it is our duty to please the public. If this system does not please the public after it has received a thorough trial, we will have to take our medicine, but I am asking that the public give it a fair and impartial trial before condemning it altogether. The new system was introduced because it is the policy of the company to practice 'safety first,' and now we have shifted the business end of the car from the rear end to the front end and thus eliminated a three-cornered proposition between the conductor, the motorman and the passenger and placed all the responsibility on the motorman. The change was made for no other reason than to insure safety. The schedule has not been changed. The cars are running as rapidly under the new system as under the old. If the public is pleased ultimately as much as we are at the present time everybody will be happy. We have not had a step accident of any kind since the new system was introduced and this would seem to prove the value of our theory."

The plan was put into operation at a time when the traffic was much heavier than usual. The first week of its operation saw several large meetings in Lexington and during the second week a fair for colored people was held in Lexington. During this fair many negroes from the surrounding country visited Lexington and the white people had to mingle with the colored passengers both in entering and leaving the cars.

SERVICE REDUCTION QUESTION IN CINCINNATI

Mayor Spiegel, of Cincinnati, Ohio, wrote to the Cincinnati Traction Company recently, stating that if all cars taken off the various lines were not restored at once the City Solicitor would be instructed to bring action to compel their restoration. He traced the legislation that has been enacted which has finally placed the authority over operation in the hands of the director of public service, who some time ago refused the request of the company to be allowed to reduce the service. W. Kesley Schoepf, of the Cincinnati Traction Company, replied on Sept. 16 that the company recognized its obligation to the public and was endeavoring to give the service required. It did not follow if the number of cars was changed that the convenience of the public was affected. Conditions were watched carefully and were met from time to time as the needs varied. He said that the cars had not only been restored during the rush hours, but that additional cars had been put on some of the lines, as there had been an improvement in the number of passengers on those lines. Chief Street Car Inspector Wisehahn reported that cars had been restored on all lines except the College Hill and Colerain lines.

Traffic Regulations in Lexington.—The principal thoroughfares of Lexington, Ky., have been marked at the intersections with white paint to indicate to pedestrians the routes they, as well as vehicles, shall take in crossing the streets. Some time ago the regulation was promulgated that pedestrians, as well as vehicles, should cross the streets at right angles, and the traffic police have had much trouble in enforcing the measure. The white painted lines are counted on to impress the regulation on the "foot brigade" and it is believed by the police authorities of Lexington that, especially in narrow, crowded streets, most of the accidents could be avoided if people crossed at right angles to the curb.

Accident Suggestion Prizes in Philadelphia.—For the best practical suggestions as to how the public can be induced to exercise proper care in avoiding preventable accidents, the Philadelphia (Pa.) Rapid Transit Company has offered $100 in cash prizes. Announcement of the contest is made by the company in connection with the Home and School League Safety Carnival at Convention Hall. The competition is open to everybody and closes on Oct. 31. Only practical suggestions are desired. No essays, sketches or poems will be considered. The prizes will be awarded on the following basis, the names of the winners to be made public on or about Nov. 15: Best suggestion, $25; second best suggestion, $15; third best suggestion, $10; ten next best suggestions, $5.

Series of Accidents in New York.—A wreck and fire occurred in the Lenox Avenue Subway in New York between the 135th and 145th Street stations, at 4:30 a. m., on Sept. 29. While firemen were at work on this accident three surface cars figured in a double collision on the 145th Street bridge over the Harlem River. The subway service still was tied up when a short-circuit caused a fire on a Third Avenue elevated train between Sixty-seventh and Fifty-ninth Streets. A collision of trolley cars at the Manhattan end of the Williamsburg Bridge was the last of the series of accidents. It was estimated that 250,000 persons were delayed by the accidents. One man was killed, a score of persons were injured, police reserves were called out, and both fire department and ambulance service had to be called into play.

Market in Philadelphia Trolley Terminal.—Under an arrangement between the Philadelphia & Western Railway and the Lehigh Valley Transit Company a farmers' market is to be established at Sixty-ninth and Market Streets, Philadelphia, Pa., in a building of the former company. Only a nominal rental will be exacted for stalls, a condition being that the occupant must be a producer, selling direct to consumer. Plans for the new market were matured at a conference at which Thomas Newhall, president, and J. L. Adams, general manager of the Philadelphia & Western Railway, and Harrison R. Fehr, president, and C. C. Collins, traffic manager, of the Lehigh Valley Transit Company, were present. The two roads connect at Norristown, where freight cars carrying farm produce to West Philadelphia will be transferred from the Lehigh Valley to the Philadelphia & Western line and brought through to the terminal.

Suburban Stop Signs in New Jersey.—The Public Service Railway, Newark, N. J., has adopted a new character of sign to designate stops on suburban lines. Heretofore the trolley station sign suspended from the span wires has been in vogue throughout the whole system. Experience has shown that while these markers have served their purpose well in the cities, it has been next to impossible to keep the signs in sparsely settled territory from being defaced. To take the place of the span wire signs the management decided to mark trolley poles with a conspicuous white band painted "stop" and to number each stop. The change went into effect on Sept. 28 on the South Amboy line and on the Middlesex line. No changes will be made in the signs in the cities of New Brunswick or Perth Amboy, but the use of pole signs will be extended to all the lines in suburban territory as rapidly as the changes can conveniently be made.

Change in Ticket Conditions in Illinois.—As a result of a decision by the Illinois Public Utility Commission at Springfield, the East St. Louis & Suburban Railroad will make an immediate change in its rules. The time limit on commutation books will be extended from three to six months and only one coupon will be detached for any one ride. On May 4 the company issued a supplement to tariff No. 2, governing passenger fares, and on July 1 put out commutation books in accordance. These books stated that the coupons inside were void if detached, but must be presented with the cover of the book, must be used within ninety days and no less than two coupons would be accepted for any fare. Their use was limited to the holder and his family or, if issued to a firm, to the employees of the latter. Protests were filed against the restrictions. The company asked for a ruling and also for permission to change the fare zones. The commission ruled, in part, that the requiring of the presentation of the commutation book cover is reasonable; that the ninety-day limit on commutation books for the use of 150 rides is unreasonable; that the requirement of two coupons as a minimum fare is unreasonable; that the zone change proposed is not desirable.

Serious Accident in Memphis.—T. H. Tutwiler, president of the Memphis (Tenn.) Street Railway, authorized a statement on Sept. 19 concerning the collision between an Illinois Central freight train and Raleigh Springs train of the Memphis Street Railway. Mr. Tutwiler stated that he had not made any comprehensive statement heretofore, because the entire time and attention of himself and other officials of the company had been occupied in giving attention to the dead and injured, and, as far as practicable, to an intelligent investigation of the facts. Mr. Tutwiler said in part: "Our investigation of the causes of the accident at Binghamton is not complete, but we are prosecuting it as rapidly as possible. We want to learn everything known that will throw light upon and fix responsibility for the catastrophe. If it appears that our company was solely responsible, we will assume the responsibility promptly. If it appears that the Illinois Central and our company both were at fault, we will share our proportion of the loss promptly. If there is doubt about our company being at all liable, we will still endeavor to dispose of all claims promptly upon a fair basis, in view of the doubt. We earnestly hope that the unfortunate sufferers will not contract with lawyers, involving large expenses and loss, until the company has had a fair chance to make settlements. None of the passengers in the motor car was injured, but eleven persons who were in the trailer were killed and sixteen were injured."

Personal Mention

Mr. Arthur St. George Joyce has resigned from E. W. Clark & Company, Philadelphia, to become financial editor of the Philadelphia *Evening Ledger.*

Mr. L. D. Pellissier, who has been general manager of the Holyoke (Mass.) Street Railway, has been elected president of the company to succeed the late William S. Loomis.

Mr. K. Shiraki, hydroelectric engineer associated with the Kinugawa Hydroelectric Company, which supplies power to the Tokyo (Japan) Municipal Railway, is visiting the United States to investigate steam turbine plants, as noted more in detail elsewhere in this issue.

Mr. L. S. Boggs has resigned as general manager of the Macon Railway & Light Company, Macon, Ga. Mr. Boggs was formerly superintendent of electrical construction with the New York, New Haven & Hartford Railroad. He was graduated from Purdue University in 1888 and has been connected with electric railway and power work uninterruptedly since that time.

Mr. William D. Kerr, who has occupied the position of director of the Bureau of Public Service Economics, New York, N. Y., since the organization of the bureau, has resigned to resume his law practice in Chicago. He will devote special attention to matters affecting relations between public utilities and the public and is also to lecture on transportation law in the Northwestern University School of Commerce. The activities of the bureau will not be interrupted, although some interval may elapse before the appointment of a new director.

Mr. N. B. Rhoads, formerly manager of the Waycross Street & Suburban Railway, Waycross, Ga., has resigned to accept the position of general superintendent of the Southern Railway & Light Company which operates the street railway, electric and gas plants in Natchez, Miss. Mr. Rhoads started in railway work with the Richmond (Va.) Traction Company. Later he was assistant superintendent of the Savannah (Ga.) Electric Company and then superintendent of the company. He was also superintendent of the Key West (Fla.) Electric Company and superintendent of transportation of the Beaumont (Tex.) Traction Company.

Mr. M. B. Rosevear, has been appointed superintendent of distribution of the Public Service Railway, Newark, N. J. Mr. Rosevear was born in 1886 at Port Oram, now Wharton, N. J. He entered Cornell University in 1904, taking the course in mechanical engineering, and was graduated in 1908. Following his graduation Mr. Rosevear became connected with the Public Service Railway as a cadet engineer. After completing the two-year course as cadet engineer, he was made assistant to the superintendent of distribution, and later, upon the death of E. J. Dunne, he was made acting superintendent of distribution. His appointment as superintendent of distribution was announced on Sept. 25.

Mr. William Eugene Keily has resigned as associate editor of the *Electrical World* with headquarters at Chicago, to engage in independent literary work. Mr. Keily was born in Utica, N. Y., June 4, 1865. In 1880 he entered a printing office and five years later, at the age of twenty, he secured a place as reporter on the *Post-Express* of Rochester. Since 1891 Mr. Keily has been a resident of Chicago and engaged in electrical journalism. He was made managing editor of the *Western Electrician* in 1899, but resigned in 1908 when the paper was sold. On March 1, 1909, Mr. Keily became associate editor of the *Electrical World.* On Sept. 26 Mr. Keily was the guest of honor at a luncheon tendered him by President James H. McGraw and fourteen members of the Chicago staff of the McGraw Publishing Company, Inc., publisher of the ELECTRIC RAILWAY JOURNAL, *Electrical World, Engineering Record* and *Metallurgical and Chemical Engineering.*

Mr. C. C. Backman, who has been appointed superintendent of ways and structures of the Mahoning & Shenango Railway & Light Company, Youngstown, Ohio, began his railway career in 1892 as a motorman with the Valley Street Railway. When the Valley Street Railway was taken over by the Youngstown Consolidated Gas & Electric Company in 1901 Mr. Backman was appointed assistant division superintendent, which position he held until the merger of the lines of the Mahoning Valley Railway and the Youngstown & Sharon Street Railway as the Mahoning & Shenango Railway & Light Company in 1906. He was then appointed division superintendent of the Youngstown & Sharon Street Railway, Valley Street Railway and the Sharon & Wheatland Street Railway, and during the last seven years, in addition to the duties of superintendent, he has had charge of all construction and reconstruction of tracks of the Mahoning & Shenango Railway & Light Company.

Mr. H. C. Prather, who has been general manager of the Buffalo, Lockport & Rochester Railway, has been appointed manager of the Rochester-Syracuse division of the Empire United Railways. This division includes the interurban line between Rochester and Syracuse and that between Port Byron and Auburn, in all about 186 miles. Before he was appointed general manager of the Buffalo, Lockport & Rochester Railway, Mr. Prather was master mechanic of the company. He has been connected with electric railway work for eighteen years. His first work was with the Union Traction Company of Indiana on overhead lines. He served subsequently with the United Railways, St. Louis, the Brooklyn Rapid Transit Company, the Public Service Railway and the Roanoke Railway & Electric Company. He was also connected with I. R. Nelson & Company, Newark, for which company he equipped seventeen cars for the Buffalo, Lockport & Rochester Railway with electric apparatus.

Mr. P. E. Emerson has been appointed manager of the Syracuse-Oswego division of the Empire United Railways, Syracuse, N. Y. This division includes the Oswego city lines. Its total trackage is 75 miles. Mr. Emerson was born in 1880. He was graduated from Williams College in the class of 1902, and then entered the employ of the Auburn & Syracuse Electric Railroad, Auburn, N. Y., in the accounting and auditing department. In January, 1904, he resigned from the company to accept a position as night carhouse foreman with the Detroit (Mich.) United Railway and subsequently held the positions of day foreman and assistant superintendent with that company. He resigned from the Detroit United Railway in July, 1908, to become superintendent of the Rochester, Syracuse & Eastern Railroad, then just placed in operation, and has continued with the company as superintendent up to the present time.

P. E. Emerson

OBITUARY

Tarleton McClure, son of William H. McClure and the third member of his family to succumb to illness in seven weeks, died at the family home in Louisville, Ky., on Sept. 15. His father, who was purchasing agent of the Louisville Railway, died a week previously and his mother seven weeks before.

E. G. Ervin, superintendent of the Wilkes-Barre (Pa.) Railway, was killed while riding in the front vestibule of one of two cars of the company which collided near Harvey's Lake on the morning of Sept. 22. Mr. Ervin was born in Middle Smithfield, Pa., on Oct. 7, 1866. He attended public school at Kingston, Pa., and also studied at Wyoming Seminary. He entered the employ of the company at Wilkes-Barre on March 4, 1890, as a conductor on the horse car line between Wilkes-Barre and Kingston. After the line was electrified he was appointed power house foreman. On Feb. 18, 1899, he was made assistant superintendent under Mr. John Clifford, then superintendent of transportation. On Jan. 1, 1914, he was appointed as the head of the transportation department of the company with the title of superintendent. Mr. Ervin is survived by a widow and two children.

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

RECENT INCORPORATIONS

***Cushing Construction Company, Cushing, Okla.**—Chartered in Oklahoma, presumably to build an electric railway from Cushing to the eastern oil field. Capital stock, $5,000. Incorporators: Frank Brown, Roy Jones and R. D. Long.

FRANCHISES

Phoenix, Ariz.—The Phoenix Railway has received a franchise from the Council for an extension of its Brill line from its present terminus in Phoenix to the city limits at McDowell Road and thence northerly for a distance of 5.8 miles to Sheridan Street in Syndicate Place.

Corona, Cal.—The Pacific Electric Railway has asked the Council for a franchise to build an electric line from Ontario Street and Lincoln Street to Taylor Street, and south on Taylor Street to Lemon Street in Corona.

Vallejo, Cal.—The Vallejo-Benicia Railroad has asked the Council for a franchise to build an electric railway in Vallejo. The company will soon ask the Board of Supervisors for a franchise to operate outside the corporate limits of Vallejo. This is part of a plan to build an electric railway to connect Vallejo and Benicia. The line as proposed will have its terminal at the Monticello wharf, where connections can be made with the boats for San Francisco. W. F. Henry, Vallejo, is interested. [E. R. J., Aug. 22, '14.]

New Haven, Conn.—The Connecticut Company has received permission from the Public Utilities Commission for the right to relocate its tracks on Church Street from Elm Street to a point near Wall Street in New Haven.

St. Peter, Minn.—The Electric Short Line Railroad, Minneapolis, has asked the Council for a franchise in St. Peter. It is planned to build this St. Peter branch in the spring.

Camden City, N. J.—The Public Service Railway has asked the Council for a franchise on White Horse Pike, linking the Haddon Heights line with the Haddon Avenue tracks. This is part of a plan to shorten the route of the line to Camden and thus cut the running time between Camden and all places on the route to Clementon.

Buffalo, N. Y.—The International Railway has received a franchise between Elmwood Avenue and Main Street in Buffalo.

Brantford, Ont.—The Brantford Street Railway has asked the Council for a franchise for an extension of its lines and the construction of a loop in Brantford.

Newmarket, Ont.—At a meeting of the Town Council on Sept. 21 the first and second readings of the Hydro-Radial Railway project were passed practically unanimously. All that now remains will be the vote of the townspeople, which will be taken on Oct. 19.

Portland, Ore.—The Portland & Oregon City Electric Railway will retain its recently secured franchise as granted by the City Council.

Corpus Christi, Tex.—The Ward Island Development Company has asked the Nueces County Commissioners Court for a franchise to build an electric line from the Corpus Christi city limits to Ward's Island, 6 miles. The company, composed of California capitalists, has acquired Ward Island, which will be developed as an amusement park, with a modern club house. [E. R. J., Sept. 26, '14.]

East Dallas, Tex.—Formal acceptance of the franchise granted by the Council to John T. Jones to build an electric railway on Parry Avenue and other streets from the Fair Grounds east to the city limits has been filed by the Board of City Commissioners in Dallas. [E. R. J., Sept. 12, '14.]

Ogden, Utah.—The Ogden Rapid Transit Company has asked the Council for a franchise for a line on Lincoln Avenue between Seventeenth Street and Twenty-third Street. The line will be used in connection with the joint interurban terminal to be erected by the local Ogden Rapid Transit Company and the Salt Lake & Ogden Railway.

TRACK AND ROADWAY

Carmack Railway & Power Company, Opelika, Ala.—As soon as financial arrangements can be made work will be begun by this company on its 7-mile line between Opelika and Auburn. The repair shops will be located at Opelika and the power house located at Lake Carmack. The company will also furnish power for lightng purposes and owns 130 acres at Lake Carmack, where it will build an amusement park. The capitalization of the company is: capital stock authorized, $15,000 and bonds authorized, $85,000. Officers: H. A. Bedell, Opelika, president; W. L. Carmack, vice-president and general manager; G. N. Hodges, secretary and treasurer, and Fulton Pace, chief engineer, all of Opelika. [E. R. J., Aug. 15, '14.]

Tramways Company, Ltd., Edmonton, Alta.—It is reported that this company has succeeded in making an agreement with the city of Edmonton that meets with the approval of the Council and Commissioners. If the Council formally passes the agreement in the near future, some work may be done this year upon the construction of the 18-mile line from Edmonton to Fort Saskatchewan. [E. R. J., Aug. 29, '14.]

Northern Electric Company, Chico, Cal.—By the end of the year this company will have spent $200,000 on improvements. New ties and new ballast are being installed all over the lines, the road is being resurfaced, new abutments are being placed on all of the principal bridges and other improvements are in progress. The Marysville and Yuba City bridge has been equipped with a complete new set of abutments.

San Diego (Cal.) Electric Railway.—The park line in San Diego to the eastern entrance of the Panama-California exposition grounds and the terminal station there are nearing completion and cars will soon be operated to that entrance.

San Francisco (Cal.) Municipal Railway.—Construction of the extension through the Fort Mason reservation to the United States transport docks will be begun at once and completed within thirty days. Owing to the great amount of work yet to be done on the Stockton Street tunnel, the line through the bore will not be in operation before the end of the year. The Columbus Avenue extension of the Union Street line will probably be completed and in operation the latter part of October.

Sacramento Valley Electric Railway, Willows, Cal.—The first unit of this railway which extends from Dixon to the junction of the Oakland, Antioch & Eastern Railway, a distance of 12½ miles, has been completed and will be placed in operation on Oct. 12. Work will soon be begun on the second unit from Dixon to Davis. [E. R. J., Aug. 22, '14.]

Freeport Railway & Light Company, Freeport, Ill.—This company plans a new extension in Freeport. Officials of the company and members of the City Council now are working out the proposed route for the new line.

Galesburg Railway, Light & Power Company, Galesburg, Ill.—Plans are being made by this company to extend its tracks west on West Losey Street in Galesburg.

Murphysboro & Southern Illinois Railway, Murphysboro, Ill.—Plans and reports have been submitted for the 8-mile electric line between Murphysboro and Carbondale. Edward Flad & Company, DeKenil Building, St. Louis, Mo., are the engineers in charge. [E. R. J., Sept. 12, '14.]

Indianapolis Traction & Terminal Company, Indianapolis, Ind.—This company is asked to extend its West Tenth Street line from Bismarck Avenue to Tibbs Avenue in Indianapolis, a distance of 1 mile.

Richmond-Hamilton Traction Company, Richmond, Ind.—Surveys have been completed by this company on its line between Hamilton and Richmond and also for a spur to Connersville and plans are being made to begin construction on Nov. 15. Eugene Purtelle, promoter. [E. R. J., Sept. 19, '14.]

Waterloo, Cedar Rapids & Northern Railroad, Waterloo, Ia.—This company has placed in operation its new line between Waterloo and Cedar Rapids.

South Covington & Cincinnati Street Railway, Covington, Ky.—Plans are being made by this company for an extension to Erlanger in the near future.

Berkshire Street Railway, Pittsfield, Mass.—Work will be begun soon by this company that includes the entire relaying of its tracks on Main Street in Pittsfield and the removal of all the trolley poles from that thoroughfare. Heavy T-rails will be laid in cement and the street will be repaved inside of the rails and for the required distance outside. Metal poles will be erected along the street instead of the present wooden ones.

Southern Minnesota Traction Company, St. Paul, Minn.—No definite plans have yet been decided upon by this company as to when construction will be begun on its proposed electric lines in St. Paul. Butler & Mitchell, St. Paul, attorneys. [E. R. J., Aug. 29, '14.]

United Railways, St. Louis, Mo.—This company is asked to consider plans to build a 2-mile extension to connect the Delmar line with the Manchester line from Rosedale Station, Delmar Boulevard, it will extend west of Forest Park near West End Heights, thence along Yale Avenue to the Maplewood-St. Louis city limits. Plans may be made to extend this branch south into Lindenwood. If the company refuses to build this extension the citizens will build it by popular subscription.

Brooklyn (N. Y.) Rapid Transit Company.—Plans are being made by this company to extend its tracks on Metropolitan Avenue, from Dry Harbor Road to Jamaica Avenue in Brooklyn.

***Cleveland, Ohio.**—An elevated railroad system, to relieve traffic congestion in the downtown section in Cleveland, is being considered by W. F. Thompson, of the City Council, and J. W. Reynolds, member of the Council committee on electric railways, who will offer a resolution at the next meeting of the Council calling for a report on cost and feasibility of the project.

***Columbus, Ohio.**—Plans are being considered by the City Council for the construction of an elevated railway to High Street to connect Hilltop and Columbus.

Stratford, Ont.—The City Council of Stratford has in contemplation the laying of 1¾ miles of electric railway on Arthur, Brock, Nelson, Alfred and St. Paul Avenues in Stratford. T. H. Jones, consulting engineer, and C. H. Hartman, chairman of the Railway Commission.

Toronto, Ont.—The members of the committee in charge of promoting the campaign in York County in support of the Hydro-Electric Municipal Railway have renewed their efforts and plans are now under way for the holding of a number of meetings during the month of October.

Ephrata & Lebanon Traction Company, Lebanon, Pa.—Before the first of the year this company plans to expend approximately $165,000 in electrifying its railway. The overhead system will be used, two new power houses built, the line improved and new equipment purchased.

West Penn Railways, Pittsburgh, Pa.—This company has placed in operation its new extension from Connellsville to Uniontown, via Leisenring, Oliver and Phillips.

Regina, Sask.—Plans are being made to build a new electric line at Regina this season to connect the new power house in Regina with the Canadian Pacific Railroad line.

Nashville-Gallatin Interurban Railway, Nashville, Tenn.—Details of the projected extension to Springfield, Tenn., are given in a communication from President H. H. Mayberry, of the company, to the Commercial Club of Nashville. In it Mr. Mayberry asks Davidson County, in which Nashville is located, to take stock to the amount of $25,000, while Robertson County is requested to take $150,000, all of this to be preferred stock at 5 per cent. The total mileage of the proposed new construction with that already built would be 45 miles, and Mr. Mayberry cites the report of the engineers who made an examination of the ground estimating that construction, equipment, etc., would average $35,000 per mile, or a total of $1,575,000.

Gulf, Freeport & Northern Railway, Freeport, Tex.—About 20 miles of grading has been completed and 10 miles more will soon be finished on this 90-mile line from Sealey to Freeport at the mouth of the Brazos River, on the Gulf of Mexico. It is planned to award a contract for tracklaying soon, as it is desired to have the first 30 miles of track ready for use within five months to afford the new line connection with another railway. The company will purchase 52 or 56-lb. relaying steel rails for the entire line, with angle bars, bolts and spikes, delivery of all material to be made at Beasley, Tex.

McKinney, Bonham & Paris Interurban Railway, McKinney, Tex.—Preliminary surveys have been completed by this company for the proposed electric line between Bonham, McKinney, Paris, Blue Ridge and Leonard. L. A. Scott, president. [E. R. J., June 20, '14.]

Ogden (Utah) Rapid Transit Company.—This company has placed in operation its extension from the Hermitage Hotel to the Idlewild resort, 2 miles east of Ogden. Plans are being considered to reroute the Bingham City cars over a new track to be constructed on Lincoln Avenue north in Ogden to connect with the fair grounds tracks on West Seventeenth Street.

Ricesville, W. Va.—The Monongahela Valley Traction Company has received a franchise from the Council to extend its electric railway from Rivesville to Morgantown, 15 miles. J. O. Watson, Fairmont, general manager.

Tacoma (Wash.) Municipal Railway.—The contract for furnishing the special work to build the municipal line from the center of the business section of Tacoma to the tide flats has been awarded to the Seattle Frog & Switch Company and the Buda Company. The contract for furnishing 118 tons of 70-lb. rails and fourteen tons of 91-lb. rails has been awarded by Public Works Commissioner Woods to the United States Steel Products Company.

SHOPS AND BUILDINGS

Illinois Traction System, Peoria, Ill.—Work has been begun by this company on a new building in Madison County. This new work is being designed for the Granite City branch of the Madison County Light & Power Company. The structure will be 25 ft. x 70 ft.

New Orleans Railway & Light Company, New Orleans, La.—Plans are being considered by this company to build a new passenger station on its property along the New Basin Canal at West End in New Orleans.

Boston & Worcester Street Railway, Boston, Mass.—Work has been begun by this company converting the carhouse on Mechanic Street in Marlboro into a freight station.

Cleveland & Youngstown Railway, Cleveland, Ohio.—Preliminary plans are being made by this company to build a new freight terminal and warehouse at the intersection of Broadway and Orange Avenue in Cleveland. The structure will be 360 ft. x 1000 ft., and there will be 360,000 sq. ft. to each floor of the six proposed in the preliminary sketches. Actual construction is not a matter of immediate consideration and further details may not go forward until the new railroad line is completed from Shaker Heights to the downtown district of Cleveland. Concerning the warehouse project, the company has obtained all land necessary for a station in the Broadway-Orange Avenue district in addition to such property as is necessary to provide right-of-way.

Texas Traction Company, Dallas, Tex.—Work will soon be begun by this company on the construction of a new depot in Dallas.

POWER HOUSES AND SUBSTATIONS

Danbury & Bethel Street Railway, Danbury, Conn.—This company will install additional substation equipment comprising a 300-kw, 600-volt rotary converter, three 100-kva, 2300-volt transformers and switchboard. The apparatus has been ordered from the General Electric Company.

Ephrata & Lebanon Traction Company, Lebanon, Pa.—Two modern power houses will be built at once by this company. One will be located at Iona and the other at Clay. The power houses will be similarly constructed, each costing $8,500.

Monongahela Valley Traction Company, Fairmont, W. Va.—Building and machinery contracts have been awarded for the new $300,000 electric plant at Hutchinson. The structure will be 230 ft. x 72 ft. The general contractor is the Nicola Building Company, Pittsburgh, while the concrete pile foundation will be provided by the Raymond Concrete Pile Company, New York. Its machinery will include gas engines built by the Bethlehem Steel Company, Bethlehem, Pa., and electric generators built by the General Electric Company.

Manufactures and Supplies

ROLLING STOCK

Peninsula Railway, San José, Cal., has ordered one passenger car.

Seattle (Wash.) Municipal Railway has ordered one freight car from the Seattle Car & Foundry Company.

H. M. Byllesby & Company, Chicago, are reported to be figuring on five new 31-ft. single-end arched roof cars for one of their subsidiaries.

Stratford (Ont.) City Council is contemplating the purchase of six cars for its proposed street railway. The cars are estimated to cost $30,000.

Carmark Railway & Power Company, Opelika, Ala., is contemplating the purchase of two cars for its proposed line between Auburn and Opelika, as described in the construction news of this issue.

Illinois Central Railroad, Chicago, has ordered four gas-electric motor cars from the General Electric Company. These cars will be used for supplementary service on some of the connecting lines of the system.

Richmond Light & Railroad Company, New York, has ordered thirty-five all-steel closed cars from the Standard Steel Car Company. The cars are 28 ft. over corner posts and 40 ft. over bumpers, and will be equipped with Westinghouse control, air brakes, No. 223 motors and Standard trucks, with 33-in. wheels.

TRADE NOTES

Cambria Steel Company, Johnstown, Pa., has removed its sales department to Philadelphia. This company expects soon to open branch offices in Buenos Ayres, Rio de Janeiro and Mexico City. A branch in London is also contemplated.

McQuay-Norris Manufacturing Company, St. Louis, Mo., announces the opening of its new plant at 2808-2810 Locust Street, Sept. 29, 1914. In connection with this, a formal opening reception will be held, followed by dancing. A large number of invitations have been sent out for this purpose.

Electric Service Supplies Company, Philadelphia, advises that since the work of the Michigan & Chicago Railway, described in the ELECTRIC RAILWAY JOURNAL for Aug. 29, was begun it has furnished through the Michigan Railway Engineering Company more than 13,000 Type L-6 compressed terminal foot bonds for bonding the entire third-rail system.

W. S. Rockwell Company, New York, N. Y., furnace engineer and contractor, has issued a convenient card for hanging in laboratory or furnace rooms, which contains data of value in connection with heating operations. This company is prepared to make inspection of furnaces and plants and devise methods for efficient production in industrial heating operations.

Railway Storage Battery Car Company, New York, has appointed Henry C. Ebert, formerly with the Cincinnati Car Company, as one of its sales representatives. This company has recently received an order to equip a new combination baggage and smoking interurban car of the Lorain, Ashland & Southern Railroad for storage-battery operation. This is the second storage battery car to be put in operation on this line.

Crocker-Wheeler Company, Ampere, N. J., has received an order to equip the Ford power plant in Detroit, Mich., with four huge generators. It will require about fifteen cars to transport all the material which comprise these four big units, each one having a normal capacity of 3750 kw and weighing 105 tons. The field frame is 21 ft. high and 26 ft. wide across supporting feet. The armature is approximately 16 ft. in diameter and weighs about 87,000 lb.

Mooney & Boland Detective Agency, New York and Chicago, announce recent changes in the personnel of the office executive staffs and the appointment of new superintendents. The Chicago office, controlling the Western division, will continue under the personal direction and general supervision of William J. Sutherland, vice-president, and the New York office, controlling the Eastern division, will remain under the personal direction and general supervision of Robert J. Ferns, vice-president.

Hess-Bright Manufacturing Company, Philadelphia, announces that owing to the interruption of communication with its Berlin factory it has made arrangements with outside parties to provide bearings in those few sizes where shortages have occurred in the large stock it has on hand. Rings in various stages of completion, which will be finished in its own factory, and in some cases complete bearings, particularly thrusts, are being made for the company, in accordance with its specifications and subject to the usual inspection.

General Electric Company, Schenectady, N. Y., has recently received orders for the following electric railway equipment: Harrisburg (Pa.) Railways, six GE-216 50-hp, two-motor and four GE-216 four-motor equipments and K platform controllers; Washington, Baltimore & Annapolis Electric Railroad, ten type M, 600-1200 volt trail-car control equipments; Southern Public Utilities Company, six straight air-brake equipments with CP-27 compressors; Hagerstown & Frederick Railway, sixteen GE-88, 40-hp, form B railway motors.

ADVERTISING LITERATURE

Nachod Signal Company, New York, has issued a folder on its signal system.

National Tube Company, Pittsburgh, Pa., has issued a folder containing illustrations included in a series of three films of industrial motion pictures which describe the manufacture of National pipe from iron ore to finished product, and which have been recently exhibited before various organizations and societies.

Prepayment Car Sales Company, New York, has issued a folder entitled "On the Job," which points out to street railway companies the advantages in saving time of allowing a concern, which originated the prepayment idea to utilize its acquired experience in evolving such devices as prepayment platforms, automatic doors, folding steps and signal starting systems, rather than in entrusting them to the ingenuity of the master mechanic.

General Railway Signal Company, Rochester, N. Y., has issued an advance notice of its dispatchers' selective signaling system, by means of which the dispatcher can control train-order signals and take-siding signals located at various stations on his division and can determine, whenever he so desires, the indication displayed by each signal. The system may also be utilized to indicate to the dispatcher a train passing a certain point corresponding to the operators' "OS" or train report.

Walter A. Zelnicker Supply Company, St. Louis, Mo., has issued Bulletin No. 159, containing 80 pages, which lists and describes its various opportunities in used railroad equipment, such as angle bars, axles, rail benders, bolsters, track bolts, air brakes, cars of all types, rail clamps, compressors, cranes, couplers, crossings, cross ties, drills, engines, hoists, fare boxes, frogs, switches and crossings, generators, jacks, lathes, sanders, car seats, track, trucks, wheels and axles.

W. N. Matthews & Brother, St. Louis, Mo., have issued Handbook No. 9, a 208-page catalog, conveniently prefaced with indexes of the specialties manufactured by this company, and of useful data contained in the book. The catalog contains detailed descriptions and illustrations of these specialties which include boltless guy clamps, cable clamps, cable splicing joints, deadendeyes, easy lamp changes, fuse switches, guy anchors, lamp guards, polerectors, prisections, scale knockers, telefaults, teleleights, telepipe and guy clamps. The handbook contains a large number of testimonial letters, among which the following electric railways are represented: Chippewa Valley Railway, Light & Power Company; Fort Dodge, Des Moines & Southern Railroad; United Traction Company, Albany, N. Y.; Northern Ohio Traction & Light Company; Milford & Uxbridge Street Railway; Southwestern Traction Company; Helena (Mont.) Light & Railway Company; Winona Railway & Light Company; Roanoke Railway & Electric Company.

Convention Number

Electric Railway Journal

This number contains an important series of Contributed Articles on the subject of Public Relations grouped under three classifications as follows: Part I—Meeting the Public; Part II—Operating Conditions; Part III—Regulation

HOW THE AMERICAN ASSOCIATION IS DEVELOPING GOOD PUBLIC RELATIONS

By CHARLES N. BLACK

Vice-President and General Manager United Railroads of San Francisco
and President American Electric Railway Association

THE primary and fundamental motive for the formation of the American Electric Railway Association was the advancement of the industry, and the only excuse for its continued existence is this same motive. That it has in the past efficiently and successfully performed its function there can be no question, but to carry on the work in the future and to render as efficient service will require not only greater financial resources, but also, what is far more difficult to obtain, the active and hearty co-operation of the ablest men connected with the electric railways of the country and all affiliated industries and interests.

The paramount question of to-day is public relations and how to better them, and the most important committee of the association is the one dealing with this subject. Composed of men than whom there are none more representative to be found in the electric railway world, this committee has held several meetings during the past year and has formulated a code of principles, which will be embodied in its report to the convention to be held in Atlantic City this month. The committee has also prepared a comprehensive scheme of educational publicity which it will submit for the approval of the association. But this program, while very important, is only the first step in many that will have to be taken before we can hope for any material improvement in the present unsatisfactory conditions, and it will be incumbent upon the association, both through its individual members and as a body, to put its shoulder to the wheel.

> **"The paramount question of to-day is public relations and how to better them. * * * The people of a community must be brought to feel that the electric railways contribute to their comfort and welfare."**
>
> *Charles N. Black.*

Frank and full publicity will be one of the cardinal principles advocated for every transportation company in its dealings with the public and with the public's representatives, the state commissions.

These commissions, in many states vested with almost autocratic power, are composed principally of men who have had but little experience in the public utility field, and, while unquestionably honest, they have had very limited sources from which to secure accurate and reliable data upon which to base their decisions.

The American Electric Railway Association has, in the interests of its members, gathered a large amount of valuable statistics and data, and no better use can be made of this store of information than freely to furnish it to any of the state commissions upon request. In fact, the day is not far distant, if it has not already arrived, when it will be deemed expedient and wise to extend an invitation to every state utility commission to send one or more delegates to the annual convention of the association, not merely as spectators but as active participants in the discussions of the problems before the industry. As Mr. Tripp stated in his admirable address before the association last February, "The time is ripe for the association to do good work in the direction of co-operating with the public." But before any co-operation is possible it is absolutely essential that the suspicion and distrust of all public utilites which is now so prevalent be dispelled, and no move which the association could make would tend more to bring this about than the one suggested above. The people of a community must be brought to feel that the electric railways contribute to their comfort and welfare, and they must have sufficient faith in the management to defend it rather than continually to knock it, as is largely the case to-day.

A CONCRETE PUBLICITY SUGGESTION

By C. LOOMIS ALLEN

Allen & Peck, Inc.

SO much of the public relations problem is nebulous and intangible that those who are interested in its solution welcome any practical suggestion, by means of which discussion may be translated into action. In my opinion such a suggestion is contained in the testimony of Joseph E. Sterrett, of the firm of Price, Waterhouse & Company, public accountants, before the Pennsylvania Public Service Commission, sitting to investigate the matter of telephone rates.

In this case, as in all rate cases, the question of a reasonable rate of return on investment was an important consideration, and Mr. Sterrett was placed upon the stand by the telephone company to testify as an expert. Mr. Sterrett offered in evidence two exhibits, one of which was a tabulation of the figures obtained from an investigation of the accounts of thirty-six manufacturing concerns and showed for each the investment, excluding as far as possible intangible values, the profits and the rate of return. The other exhibit was a tabulation covering in a similar way nineteen trading concerns. The companies selected were taken, at random, from a large number investigated by Mr. Sterrett's firm, and the witness testified that, in his opinion, the result would not be materially altered were the list indefinitely extended.

> **"Let the people see that the undue limitation of return on money invested in local transportation is not only unfair to the holders of utility securities but it is a preventive of extensions both of line and service as well. Such limitation hits the street car patron as well as the owner of utility stock."**
>
> —*C. Loomis Allen.*

The rate of return for the manufacturing concerns showed an average of 14 per cent, and for the trading firms about the same. Mr. Sterrett testified that most manufacturers expect a rate of return approximating 20 per cent, and pointed out that public utilities were compelled to compete in the open market for the money for extensions and betterments with these concerns.

This was valuable and enlightening evidence and must have made an impression upon the minds of the commissioners. The tendency to limit the rate of return upon money invested in utilities is alarming and the public is apt to lose sight of the very essential fact that, with a limited rate of return, the utilities must bid for investment money against industrial concerns whose rate is unlimited. The opportunity is before every electric railway executive to do some effective publicity work along the lines suggested in the testimony.

The executive knows what the profits of the local manufacturing concerns are. If he will tabulate the data as to local investments and the rates of return secured, he will have some valuable ammunition. These figures should be put in such shape that they can be readily understood and then placed before the local public. This will let the people see that the undue limitation of return on money invested in local transportation is not only unfair to the holders of utility securities but is a preventive of extensions both of line and service as well. Such limitation hits the street car patron as well as the owner of utility stock.

When the improvement of public relations is discussed we are often confronted with the argument that the subject is so abstract in its nature that little if anything can be done by concerted action. Here, however, we have a concrete instance in which good work can be performed, not only for individual interests but for the industry as a whole. Multiply such instances, and in a short time an effective, active campaign will be in operation. In other words, theory should be translated into action.

COMPLETE UNDERSTANDING BETWEEN COMPANIES AND PUBLIC DESIRABLE

By L. S. STORRS

President of the Connecticut Company

NOTWITHSTANDING the efforts of electric railways toward publicity and the work of the public service commissions in promoting public realization of the issues between the companies and the public, much work remains to be done before a complete understanding between these interests, with all the good that it should mean to both, can be expected. It is assumed that one of the principal reasons why the public has not permitted companies to increase revenues as expenses increase is that it has not appreciated the importance of successful financial results of the operations of the public utilities. It has not appreciated the importance of this mainly for the reason that it does not know what it really means to the companies and, in turn, to the public in the way of service. It is the duty of companies to try in every way to inform the public fully in regard to the meaning and effect of changes in their financial position.

Statements of financial operations are made by the companies to the public service commissions, which exist in practically all the states. These statements are open to public inspection, but ordinarily, unless some effort to explain them is made by the company, they are not understood by the public. In the absence of knowledge the public is in danger of regarding the large sums received as gross revenue as somewhat in the nature of profit without considering the existence of heavy deductions which must be made for expenses, taxes and interest. Even in ordinary times it cannot be expected that the public will have a conception of the meaning of the results of operation of the companies unless a strong, persistent and determined effort is made to explain the facts. In extraordinary times, such as these, when the companies are suffering, not only from decreased revenue but also from heavy increases in all of their items of outgo, it is all the more essential that wise, considerate and fair efforts be made to acquaint the public with the facts.

If a company could go ahead indefinitely with the track mileage with which it originally started, with the same cars, power equipment and other facilities which enable it to render service, the problem of financing would be less insistent and it would not be a matter requiring constant explanation to the public. However, neither the public nor the company would be satisfied with a service based on the original investment. Such service would mean not only lack of growth, but absolute deterioration of every city, town and village which now enjoys railway service. American communities have grown so rapidly, and generally the demands for increased service have been so regular from year to year, that greater facilities have been needed continually. Without new investment it would be absolutely impossible for companies to give to the public the service that it ought to have.

It should not be expected that the public will receive all of the benefits of increased investment and increased service at the expense of the company. The company is a going business machine. Unless it is a profitable going business machine it cannot expect to enlist new capital in its service. Unless it can show investors that it is making a profit on the capital already invested, it cannot induce them to advance more money for development. In order that public service corporations may attract the new capital required continually for necessary additions to property and betterments of existing systems it is absolutely necessary for them to obtain sufficient net revenue to provide a reasonable return upon the fair value of the property devoted to the public use.

> **"The people should realize that reduced net revenues mean an inferior service with which they will not be satisfied and a decrease in the amount of facilities added to the property for the benefit of patrons."**
>
> —*L. S. Storrs.*

There is a logical connection between the difficulty of raising new capital which many companies have experienced in the last year and the agitation for reduced fares. New capital has to be invited by the promise of a fair rate of return. If, while the company is seeking new capital, the public served by the company is agitating for reduced rates, investors are likely to fear that the return promised them on their capital will be imperilled. If the amount of revenue is in danger of reduction while actual expenditures, as is well known, are increased, there is certainly no assurance for the investor that the income available for return on the capital will not be seriously reduced.

It is often difficult to trace the reason for an attack on a company. The sources of attacks on public service corporations differ in various communities. Sometimes they are in the public press which, in some communities, does not hesitate to attack corporations and their affairs bitterly. On the other hand many newspapers of public circulation have not hesitated to champion the cause of the public service corporations. We have examples of this fact in the present agitation for an increase in railroad freight rates. Many newspapers are asking that the government authorize an increase in freight rates so that the railroad situation may be strengthened at one of its weak points. In order to advance political prestige public officials in some cities use public service corporations as a target for attack. Public officials are in office to serve the entire public, and they ought to protect companies from improper exactions on the part of the public just as much as they protect the public from improper practices on the part of companies. One glaring case of injustice is the refusal of the Post-office Department to grant adequate compensation for the service performed by electric railways in the transportation of mail. There are of course many public officials who are fair in their dealings with companies.

In times like these, when revenues are declining and expenses are uncertain, public officials can do a good deal to relieve tension by a very careful scrutiny of all of the expenses which they impose upon electric railways. For instance, the present craze for permanent pavements throughout the Eastern part of the United States, together with the demand upon transportation companies to undertake the replacement of that portion of existing pavements which is within the area occupied by the tracks, is placing a constant burden upon revenues. This burden is absolutely unproductive of any return and is a permanent heavy charge on the revenues of the companies. The extent of this burden cannot be appreciated by those who have not had actual experience with it. It can be appreciated by business men who know what it means to be called upon to make an annual capital investment of at least 1 per cent of the total outstanding capitalization of their corporation for betterments that yield absolutely no return.

The unfortunate financial result of the imposition of unproductive expenditures upon the corporations is, however, not the only result. The managers of public service corporations should be on their guard at all times to keep themselves from being so influenced by acts of the hostile element of the public that they will lose that touch with the conservative element which ultimately will help them to preserve the integrity of their property. Unless managers guard themselves against it, the tendency of reductions in rates and the imposition of expenditures for public benefit which cannot possibly yield any revenue will be to create antagonism. Antagonism will not be of the slightest aid in the solution of the problems with which the companies are confronted.

The companies have a large and important work to do in a publicity campaign that will show the inevitable results of pressure upon revenues on one side and demand for greater expenditures on the other side. The people should realize that reduced net revenues mean an inferior service with which they will not be satisfied and a decrease in the amount of facilities added to the property for the benefit of patrons.

THE IMPORTANCE OF GOOD PUBLIC RELATIONS

By THEODORE P. SHONTS

President Interborough Rapid Transit Company, New York

FOR many years the merchants of the world have recognized the value of possessing the confidence of their customers. Those who have been most successful in the conduct of their business have striven to treat the public fairly, have justly acquired a reputation for upright dealing, and thereby through the co-operation of an appreciative public have built up vast business enterprises.

It is an economic fact that good-will is an asset of definite intrinsic value. Therefore those in charge of transportation facilities should keep constantly in mind the fact that to conserve and enhance security values it is just as important to keep continually adding to their "friendship list" as it is to add to the "equipment list"—both being prime factors making for stability of earnings. It may be said that the market value of such good-will is dependent upon the degree of cordial relationship existing between transportation facilities and the public; and while this is a fact which has long been recognized by transportation officials in general, it is only of comparatively recent date that they have come to a full realization of the fact that real and enduring friendship of the public can be builded only upon confidence, and that the public's confidence can only be secured through frank and honest dealings in the handling and treatment of all details of corporation affairs.

In the past many large public service corporations seem to have considered that the franchises held by them and the strategic advantages they had secured placed them in an impregnable position where they could afford to conduct their business in a more or less arbitrary way. Undoubtedly in a large number of instances their business methods were entirely consistent with the ultimate interests of the public and necessary for the welfare of the properties involved, but the officials who were operating such properties did not take the trouble to explain why it was essential to pursue a given line of action.

Taken as a whole, the American public is a reading public and a thinking public. No greater affront can be given to its intelligence than to treat with silence well-meant criticism based on reasonable grounds of complaint as viewed from the standpoint of the public. This does not mean that technical questions of law, engineering or accounting can be lucidly discussed in words of one syllable, and the merits of all sides of an issue clearly presented to the public in a half-column newspaper article. There are, however, very many factors bearing upon the great industry of transportation which are not at all understood by the public at large and which, as the occasion arises in each locality affected, could advantageously be explained so that the public would have a clearer idea of some of the problems with which railway men are confronted. The public should not be allowed to receive the erroneous impression that silence in regard to its criticisms is indicative of contempt for its views and that failure to explain is due to the fact that no adequate or reasonable explanation is possible.

With a public service corporation a policy of silence may, and often does, create a suspicion and distrust on the part of the public which it serves.

During the last forty years this suspicion and distrust have been steadily increasing all over this country. Fuel has been added to the smoldering fire as here and there evidences of wrongdoing on the part of individual public service corporations have been brought to light. The newspapers, which are the great disseminators of ideas as well as of facts, have had very much to do with bringing about the situation existing to-day. Many, and I think the great majority, of the members of the newspaper profession are men of high ideals who aim to publish accurately, quickly and in readable form, the news of the day and to make such editorial comment thereon as from their standpoint is logical and fair. Such men have seen from the public viewpoint the reasonableness of certain criticisms made with regard to public service corporations. In many instances they have been unable to obtain the corporation's side of the question at issue because of the latter's refusal to discuss the matter, and they have therefore been obliged in the light of their own knowledge and reasoning powers to set forth the facts and to comment thereon as best they might. A policy of frankness on the part of public service corporations toward such journalists, if instituted thirty years ago, would have brought about a very different attitude on the part of the public from that existing to-day.

There are journalists of another type, however, who I believe to be in the minority but whose ranks have considerably increased within the last twenty years, who are not especially painstaking about making an accurate statement of the news of the day and an impartial comment thereon, but who from motives of politics, of personal interest, or of personal grievance are prone to color news in order to give the public a very different impression of the facts from what is actually the case. This policy of misleading the public is most successfully carried on through the statement of half truths and through the suppression of a portion of the facts which, if stated in full, would put a very different light on the whole matter. The journalists of this particular class have not been slow to utilize to their own advantage and to the advantage of the newspapers with which they are connected the just resentment of the public against the policy of silence on the part of public service corporations. Through the activities of this group of journalists the public has been deceived, and in an incredible number of cases one finds persons of intelligence who regard as clearly established facts, accusations which have been made by the irresponsible element of the press, either directly or by innuendo. This condition of affairs would never have existed if the corporations had long ago ceased their policy of silence and seeming indifference.

It is beside the question to say that the public is not qualified to judge because of lack of knowledge of all of the facts involved. It is not a sufficient answer to say that the rules, regulations and procedure of the corporations in probably the majority of cases have been and are now observed with due regard for the interests of the public and of the financial integrity of the property. The public has felt it was justified in knowing why such and such things were done or not done, and because the answer was not forthcoming the public was determined to create conditions that would compel satisfactory response to such inquiries.

> **"It is an economic fact that good-will is an asset of definite intrinsic value."**
>
> —*Theodore P. Shonts.*

Another element which has contributed its quota of influence toward crystallizing public opinion against corporations, simply because they are corporations, has been the politician, particularly the municipal politician who has been sufficiently astute to seize upon an issue with which to catch the ear of the public and who has recognized that to attack a public service corporation was the popular thing to do. Many of these men have no doubt been more or less sincere in the statements they have made on hearsay evidence; they have been confirmed in their views by the silence with which their accusations have been received by the accused. Other politicians have known that the statements they have made were inaccurate and in some instances false, but they have trusted, and apparently with good reason, to the policy of silence of the corporations.

All of these factors have led to the enactment of laws and ordinances having for their object the curtailing of the powers and intimate surveillance over the affairs of public service corporations. Furthermore, the influences to which reference has been made have culminated in the creation of public service regulating bodies all over the country. Members of these regulating bodies have been appointed not because their knowledge of the conditions involved has rendered them especially qualified to act intelligently and constructively, but rather because they were deemed willing to give expression to popular resentment and to wreak popular vengeance upon public corporations for real or fancied wrongs. The public is generally inclined to-day to regard all railroad companies with suspicion. The only remedy is a policy of aggressive action, having for its object the education of the people. The old saying, "Necessity is the mother of invention," is applicable to the situation in which the railroads find themselves to-day. They are compelled by force of events to adopt a different policy in the treatment of the public from that followed heretofore if they are to survive as public service corporations.

The sentiment all over the country with regard to the recent action of the Interstate Commerce Com-

"There are three factors which are indispensable to the securing of satisfactory relations with the public:
"First—A policy of fairness and frankness toward the public, followed out in actual practice in the conduct of corporation affairs.
"Second—Efficiency of service.
"Third—The spirit of helpful and constructive co-operation between the public and the corporations."
—*Theodore P. Shonts.*

mission favoring an upward revision of freight rates is indicative of the fact that if the public is convinced of the justice of a proposition it will speedily rally in support of it. The public to-day is taking a greater interest in the affairs of corporations than ever before, but the public is also beginning to realize more fully to-day than formerly that the interests of all concerned can best be served by co-operation between the public and the public service corporations. No more important work demands the careful consideration and attention of officers of large public service corporations than that of deserving and winning the confidence of the public and of securing its co-operation in order that the property involved may render to the public the best possible service.

Many corporations have gone to the extent of establishing a department to take charge of this very important matter and are spending considerable money to remedy conditions which might have been prevented by far less effort than is now necessary to correct them.

There are three factors which are indispensable to the securing of satisfactory relations with the public:

First—A policy of fairness and frankness toward the public, followed out in actual practice in the conduct of corporation affairs.

Second—Efficiency of service.

Third—The spirit of helpful and constructive co-operation between the public and the corporations.

The policy of the corporation should not be shaped by any narrow conception that it has a monopoly either through its franchises or otherwise. Experience has taught that if the public is with reason justified in complaining of service rendered it will find some way of applying a remedy and will obtain the end sought, irrespective of all the legal obstacles which may be involved. Science and invention have not by any means reached the limits of their possibilities, and no matter how firmly entrenched any company may believe itself to be, unless it plays fair with its patrons it is certain to be threatened sooner or later by effective competition which the march of science has unexpectedly brought into being.

The term "efficiency" is very elastic, but in the sense above used, as applied to railroads, it means adequate and proper service, with due regard to regularity and frequency. It means also courteous behavior on the part of employees. Regularity of service is necessarily dependent to a marked degree upon proper maintenance of equipment, transportation methods and discipline. Frequency of service is largely determined by reasonable public convenience and a fair return for service rendered. The courtesy of employees cannot be secured by a mere reiteration of regulations or the arbitrary enforcement of discipline. Employees must be convinced that courtesy makes the performance of their own duties much easier, that they are the representatives of the company with whom the public comes into constant touch, and that if they say the wrong word at the wrong time they have committed an act detrimental to their employers and to themselves which it is most difficult and almost impossible to repair.

The feeling of the public toward a railway corporation is undoubtedly influenced to a greater degree by the action of the employees with whom the public comes in contact than by any other single factor. It is of no consequence if the passenger is dissatisfied without reason or complains unjustly; the employee or representative of the company with whom he is dealing must use tact, must say the right thing and say it with the right tone of voice in order that proper public relations may be established and maintained.

An effort must be made to convince the public that the rules and regulations in the operation of a railroad are necessary for the convenience of the public as well as for its safety and comfort, such as rules framed to prevent accidents or those prohibiting throwing rubbish or spitting on the floor of cars, and matters of similar character. By creating a public sentiment against practices which are harmful or annoying to the public, as well as expensive to the railway, the latter can best secure the help of the public. The railway companies are largely responsible for the view in which they are held by the public to-day, and because of that responsibility it is incumbent upon them to set themselves right in the eyes of the people at large. Matters which are frequently considered too trivial or too well understood to require explanation are precisely the subjects which ought to be made clear to the public because the public does not appreciate their significance. The American people as a whole are ready to concede the right of a fair return on invested capital. There is no reason to suppose that when they understand the facts they will demand that investors are to be penalized for putting their money into efficiently managed public service utilities while private capital invested in other enterprises which have not for their object the immediate benefit of the public is to be encouraged and assisted to reap large returns. But the public must be shown that the management is efficient and that if the return on investment is not fair or just such fact is due to overtaxation or underpayment for service rendered.

The impression has been very generally held that public service corporations are necessarily money-making propositions and not subject to the same economic laws as any other kind of business. It is only by taking the public into our confidence, by working in hearty co-operation with the representatives of the public who have been chosen to supervise public service corporations and by the efficient management of the properties devoted to the use of the public, that the money invested in these utilities will be enabled to earn a fair return. It is only through the sympathetic and intelligent co-operation of the public and of their chosen representatives in legislative and regulatory bodies that the public service corporations will be able to live and to render to the public the greatest service of which they are capable.

THE GOOD-WILL OF THE PUBLIC AS A STREET RAILWAY ASSET

By JESSE W. LILIENTHAL

President United Railroads of San Francisco

WHEN I assumed the presidency of the United Railroads of San Francisco I believed that it was the most unpopular public utility in the country. Nothing that has occurred since that time has made me think that the original opinion was unfounded. Much of its unpopularity was no doubt unwarranted, and much of it was to be accounted for by the antagonism developed by the strikes, the graft prosecution and the successful campaign for a municipal railroad. I am assured and believe that much of this ill-will on the part of the general public has been eliminated. That means that when the company now comes before the public its protestations are more likely to be accepted as made in good faith, that when favors are asked by it they are more likely to be granted and that when its troubles are ventilated they are more likely to arouse sympathy and indulgence. If only for these reasons, and especially in the present temper of the public towards public utilities, its good-will must be of paramount importance.

Assuming, then, that the United Railroads has made some progress in the public favor, or at least had begun to do so up to the time of the Solano disclosures, and at the risk of being criticised for a *post hoc propter hoc* argument, reference may be made with some possible advantage to the things that were done by the new administration to obtain the good-will of the public.

It was announced at the outset that the company would keep out of politics and that, if it ever undertook to influence public opinion, it would do so openly and in the name of the company and that the company would consider its paramount duty to be to adequately serve the public and, to that end, invited the co-operation of all citizens in the making of complaints and recommendations.

Then, although the employees of the company were not organized the company proceeded to develop and publish a plan for their welfare according to which, without any compulsion whatever, the wages of employees were substantially increased, the lives of those in the employ of the company three years and upwards were insured for the benefit of their families without expense to them or physical examination, and, in order to insure greater care for the avoidance of accidents, the men were promised the entire saving that might be made from year to year over payments made during 1913 in the settlement of damage claims. A proposition for company stores to furnish the families of employees with necessaries of life at cost was under consideration, but, improper motives having been insinuated, that project was abandoned. Finally, a monthly magazine was established for the interchange of views between the employees and the management and numerous recreational facilities for the men were developed by the company at its own expense.

I believe these things have caused the company to be known now as a public welfare, as well as a public utility, corporation, and that this attitude on the part of the public is the company's best asset. Certainly, when it comes to regulation, the governing bodies are bound to make a difference between popular and unpopular public utilities.

> **"I believe these things [described in the article] have caused the company to be known now as a public welfare, as well as a public utility, corporation, and that this attitude on the part of the public is the company's best asset. Certainly, when it comes to regulation, the governing bodies are bound to make a difference between popular and unpopular public utilities."**

THE NEED FOR CORPORATE COURAGE

By GEORGE H. HARRIES

Vice-President H. M. Byllesby & Company

THE one thing needed to make satisfactory our relations with the public is corporate courage. Individual courage is common. Its existence is seen in the vast investments made in electric railway enterprises, many of them shaped by pioneers who builded and hoped, and who died before their visions came to be material. Other pioneers, no less daring, are building and hoping and striving. There are and always will be such makers of communities; the supply increasing or diminishing as public sentiment, embodied in law, approves or makes impossible projects such as those with which we are familiar.

The timidity of the investor's dollar is proverbial, and because the multiplied dollar is the foundation upon which we build it necessarily follows that the structure will have vibratory tendencies and be subject to tremors. When the legislative earth movements become convulsive the basic dollars frequently lose the power of cohesion and are buried (often beyond recovery) beneath the ruins of what should have been an enduring utility.

> **"National conscience—the aggregate of countless individual consciences—is being aroused, and there is perceptible growth of a disposition to deal fairly. Let the trembling investor * * * give substantial support to that corporate courage which enunciates the plainly-stated truth, and 'the truth shall make us free'."**
>
> —*George H. Harries.*

It is therefore not surprising that the menace of destruction should breed corporate cowardice; that some of the owners of the invested dollars should kneel humbly before the altars of the gods of legislation and appeal for righteous consideration; or that other owners of invested dollars, driven to desperation by fear, should curse the templed priests and all their works.

Here and there were a few public-serving corporations—their number growing all too slowly—whose executives assumed or were permitted to talk frankly; to tell the people at large the whole truth and nothing but the truth; to set forth the problems confronting the investor, the operator and the patron; to preach the world-old doctrine that "No man liveth unto himself alone," and that strife (whether the cause was a rare care of corporate misbehavior or the assaults of a demagogue) was an inexcusably wasteful and mutually disadvantageous thing. But for the most part there was corporate silence, broken only by occasional and feeble cries for help—spasmodic sounds that had no more effect on the public than did the gurglings of a drowning witch fighting vainly for life in the presence of a highly virtuous multitude in the good old days when there were no public utilities to be baited or sacrificed.

Of late, however, there has been an awakening. Many corporate worms have done more than merely evince a desire to turn. Some have turned and others are turning. Executive officers have seen and are seeing that only public opinion can overthrow the political charlatan or close the mouth of him who agitates for revenue only. There is less of office seclusion and more of companionship with the ticket-purchasing, freight-paying mass. Careful presentation of facts and analyses of facts—verbally stated to real audiences or prominently and personally set forth in the newspapers—is succeeding the old and often sullen or contemptuous speechlessness. Herein is the way to co-operation and peace.

It is interesting to note that the beginning of this era of tremendous legislative disturbance coincides with the time when, as the result of corporative initiative, free transportation and many other special privileges were either materially curtailed or permanently abolished. There was no spontaneous popular moral uprising, as some folk seem to imagine. The true incentive of the whirlwind attacks on transportation agencies and other public utilities was so much less than moral that it may fairly be declared immoral. When a few corporate crusaders put into effect the doctrine of non-discrimination, selfish and political interests resented the deprivation. Those who had been petitioning or demanding beneficiaries became vicious tormentors, creating opportunity to disguise themselves as reformers and to be improperly counted by the undiscerning as sincere friends of the millions whom they always referred to as "the dear people." Those angry and alert factors in a deeply-disturbed situation have, however, shot their bolts, unless we provide them with new targets and replenish their stores of ammunition.

National intelligence is taking note of corporate conditions and is on the way to realizing the interdependability of the public and the public utility. National conscience—the aggregate of countless individual consciences—is being aroused, and there is perceptible growth of a disposition to deal fairly.

Let the trembling investor take heart. Let him cease to waste his energies in mere railing. Surely he knows that no man ever achieved by quitting. Let him give substantial support to that corporate courage which enunciates the plainly-stated truth, and "the truth shall make us free."

PUBLIC RELATIONS

By H. M. BYLLESBY

President H. M. Byllesby & Company

THE establishment of good relations between a public utility and the community which it serves is of great importance to both the utility and the public. With nearly every public utility corporation this is an old subject. All of those with which I have been connected during the past thirty years have considered this matter as one of the first of the cardinal principles bearing upon the success or the failure of their operations.

While the continent was being subdued, while enterprises were being developed and while utilities were under construction, these matters naturally received but slight attention. That period, which future generations will consider as marking the most wonderful example of the development of a great continent, is now drawing to a close, and it is eminently proper that such questions as the one considered in this paper should now receive careful and thoughtful attention. The scope of this consideration should be larger than the mere question of the relations of a public utility, or common carrier, to the public. It really involves the fundamental question of the relations of each man to his fellow and opens up the entire subject of mutual fair dealing, of justice and common honesty.

Only a few years ago no more autocratic individuals walked this earth than the average, politically appointed officer of the law, of the customs, of the police, or the various branches of government. As a close second to the arrogance and sometime brutality of these political appointees were the junior officers and employees of some of the great railway corporations. The fact that an individual was clothed with temporary power in those days seemed to require him to carry himself in an arrogant and supercilious manner. With the development of the civilization and enlightenment of our continent this spirit has been rapidly disappearing, and to-day is practically extinct.

I believe that the so-called public utility corporations, embracing the electric light and power, gas and electric railways, were among the first to recognize the wisdom and necessity of treating the public with dignified courtesy and with a cheerful willingness to smooth over the inevitable irritations and frictions, which always have occurred and always will occur in the contact of man with his fellows. As long as human nature is as at present constituted it will be idle to look for an Utopian condition. There will always be the discourteous, the unduly selfish, the arrogant and the brutal. The individual or the corporation which proposes never to resent wrongs or insults will not last very long in the present order of the universe. To be able, consistently and under all circumstances to choose the course which will most avoid friction and discomfort without sacrificing to the bully or the unfair individual the rights which should be manfully sustained is exceedingly difficult and trying, and with these difficulties the officer or employee of the public service corporation is amply conversant.

A large part of the frictions and troubles of the world are caused by the unbending egotism, or, in other words, the narrow-mindedness, of the extreme individuals in any community. All successful public relations in any careful analysis will be found to be grounded on the fundamental proposition of fairness to all parties concerned. The sense of relief which the public service corporations as a rule have experienced from the creation of competent, experienced and self-respecting public service commissions is due, principally, to the growing feeling that before such commissions they are justified in expecting a calm and dispassionate review of their situation, with less prejudice against them than has heretofore existed on the part of governing bodies to whom in the past they have been compelled to report.

> **"All successful public relations in any careful analysis will be found to be grounded on the fundamental proposition of fairness to all parties concerned."**
>
> —*H. M. Byllesby.*

When a public utility corporation serves its community with a modern and substantially built and efficiently operated plant of an ample size for the requirements of the territory served, with charges for the service which are not discriminatory and which yield a just return on the value of the utility property, the first element of successful public relations has been discharged.

Of equal importance is the necessity that the utility company shall be officered and served by employees who recognize the rights of the public to courteous treatment, absolutely fair dealing and with an absence of unnecessary, irritating rules, regulations and conditions.

The third and co-equal condition is that the community so served shall recognize its obligations and the necessities resting upon it to deal with the utility in the same spirit of fairness and to avoid imposing upon the utility irritating and unfair rules and regulations, unfair terms and prices for its service, and that the public recognize that the utility has the same right to fair treatment and to a fair return upon its value as any merchant or any other corporation has and with a minimum of unnecessary investigations and hampering restrictions. When these conditions are fulfilled the furore, excitement and exaggerations which have filled the air for the past few years will very largely disappear.

To my mind a necessary step to bring about these conditions is that the regulatory control of public utility corporations should be taken entirely out of politics and should be vested in the hands of thoroughly competent, high-minded, intelligent and experienced officers appointed for that purpose. The utility companies have made their full share of mistakes and errors in the past. They have recognized them. They have corrected them to a surprising extent, and to-day, in the vast majority of cases, more successful relations with the public must come from a changed attitude on the part of the public itself.

The utilities, in general, and with rare exceptions, have gone to the full limit in establishing fair dealing with courteous and considerate attention to the public, and the next step in advance is one which can be taken only by the public. The communities served must recognize the value to them of the public service corporations and treat them in a spirit of justice. This includes regulation by officers or commissions who will be free from political bias, who will not be carried off their feet by unreasoning tirades on the part of the public and who, with equal firmness, will control the utilities and require the public they serve to render to the utilities the fair treatment which all mutually successful affairs require, included in which will be, of course, the allowance to the utility companies of a fair and just return upon the value of their properties.

PUBLIC OPINION AND BUSINESS

By GUY E. TRIPP

Chairman Board of Directors, Westinghouse Electric & Manufacturing Company

IN this country public opinion is the final arbiter of all things political, commercial and financial; and, now that it is turning more and more attention to business, men are looking into the future in an endeavor to forecast whether there will come safety and business freedom or the reverse.

Fortunately we are not without precedent, because we have reached a point in the affairs of public utilities which enables us to view the growth and development of public opinion in connection with those enterprises and the effect that it has had upon their financial stability and prosperity.

> **"Our public utilities, which were in the category of semi-speculative investments, have or will become a preferred class, because the whole plan or regulation by commission must rest upon the fundamental proposition of a fair return on a fair capitalization."**
>
> —*Guy E. Tripp.*

While it is true that a business which is semi-public in its character presents economic features that cannot be found in private and competitive business; nevertheless, if those interested will make an unbiased review of public opinion as it has worked out during the last twenty years, they will be helped considerably in forming a judgment on the probabilities of the future.

That public opinion is based upon a greater volume of knowledge than formerly must be assumed not only from the number, but the character of present-day periodicals. This knowledge may be superficial and much of it unsound, but the fact remains that the people have graduated from the insipid magazines and somewhat crude newspapers of twenty-five or thirty years ago to advanced publications which print much matter understandable and interesting only to people who think.

This educated public opinion is of recent growth, surprisingly recent so far as business is concerned. Men who twenty years ago were conducting public utilities did not then conceive that the public had any desire to acquire knowledge about such things; or, if it had the desire, they doubted its ability of comprehension; and further, it was conscientiously thought to be none of the public's business.

I know from personal experience that inquiries and expressions of opinion from laymen were regarded as impertinences and as prying into one's private affairs.

Such resistance only resulted in damming up the stream for awhile and, when it broke, the education of the people was remarkable for its inaccuracy. In fact, when it came to financial matters, it was weird. Those familiar with affairs of that time will recall popular financial analyses which showed unbelievable ignorance of the simplest fundamentals.

It was then that public utility men went to work explaining, and explanations sometimes degenerated into apologies and evasions. Men who knew their business were exasperated with the honest bunglers and disgusted with dishonest muckrakers, and moreover they were irritated with a vague sense of their own vulnerability.

Public opinion received a severe test at this period; but, notwithstanding the avalanche of incendiary articles in the public prints and the uncompromising attitude of many utility men, it remained fairly steady; and the mere fact that it was not stampeded into confiscation of property and retaliatory measures was reassuring.

I do not mean to criticise the energetic defence of their investments by the capable leaders of the public utility field. Quite the contrary, it was courageous and necessary and the only thing that molded an incoherent mass of public knowledge and misinformation into the germ of public intelligence, which enabled the people to see that business could not be dealt with *en masse*, and the result was the rapid and widespread inauguration of public service commissions with limited executive powers and, best of all, without infringing upon the jurisdiction or weakening the protection of our courts of law. In no other way could the *impasse* have been dissolved, and, while many old-timers in the business failed to see the light, the leaders did and approved and co-operated.

Of course, all obstacles are not yet overcome, and there are many untried phases of the experiment. But it is not an overstatement to say that our public utilities, which were in the category of semi-speculative investments, have or will become a preferred class, because the whole plan of regulation by commission must rest upon the fundamental proposition of a fair return on a fair capitalization. This is something more than a mere formula of words. It is the automatic and inevitable result of mutual necessities and cannot be escaped except by municipal ownership.

It is reassuring that, after nearly twenty years of wrestling with public opinion, public service enterprises have been placed on a higher investment plane than ever before, but it should be clearly borne in mind that this has been the result of two opposing forces, the most important one being the jealous, intelligent, energetic and honest efforts in defence of their rights by the men who had invested their money in these projects.

If the same spirit and energy of defence is shown for the future I believe that public opinion will grow more and more intelligent and will ultimately reach sane conclusions on all business questions. In any event, we want no other umpire than public opinion in this country.

IS PUBLICITY A CURE-ALL?

By A. W. WARNOCK

General Passenger Agent "Twin City Lines," Minneapolis and St. Paul

THOSE of us in the street railway business may think that we receive more than our share of criticism from our patrons and the public generally, but in view of the large number of transactions we have every day with our customers, it is probably a fair statement to say that we do not have any more troubles in proportion to the volume of business than does the corner grocer.

Suppose that we call a street railway company a huge 5-cent department store. In the case of a company which operates 1000 cars over a trackage of 400 miles, we then have the equivalent of 1000 counters, or departments, each in charge of two clerks (motorman and conductor) making sales and serving customers over a wide area. The department store has the advantage over the railway in having all of its clerks under one roof. If a customer has a dispute of any kind with a clerk, a floorwalker or some other authorized representative of the management is at hand to smooth out the trouble in short order. But in the street railway business a controversy between a passenger and conductor may occur 50 miles away from the general offices. With the exception of the conductor and motorman, there is no one representing the company at hand, and considerable damage may result in the loss of a friendly passenger and the acquisition of an unfriendly one because of that geographical fact.

> **"Publicity is like a huge megaphone, but does it not defeat its purpose when we are constantly shouting through the megaphone explaining our business and really taking on a defensive tone when the need to do so may not exist?"**
>
> —*A. W. Warnock.*

In all lines of business there exists the desire to increase the number of friends and to reduce the number of enemies; to convert liabilities into assets. It would seem as though we must look to our clerks (or conductors) to rise to their highest possible opportunities in helping us to have more friends and fewer enemies. If our men will always use fair judgment, if they will always be ordinarily civil, reasonably considerate, and fairly efficient in their duties, they, of all our employees, can do most to keep our relations with the public friendly.

I do not think that publicity is a cure-all, by any means, for the growing tendency of the times to criticise so-called "big business," particularly public service corporations. It is true that in the past we may not have used enough publicity. We have remained silent on too many occasions when we should

> **"The main thing that it behooves a company to do is first to put its house in order, if not already in order, and keep it so. The public will then have greater confidence in the company's sincere purpose to do the right thing."**
>
> —*A. W. Warnock.*

have spoken. It may be true also that we are swinging too far to the other side of the pendulum's arc now and are making a fetich of publicity as a cure for every ailment that we may be heir to.

Publicity can be used, certainly, to good advantage for the purpose of educating the public regarding matters upon which it should be informed. For a long time companies were silent as to the vast costs of the improvements they were undertaking each year, as to the amounts of money they were distributing, in wages, to local dealers for materials, in taxes, and for many other items. These facts the average citizen did not stop to consider, and the companies might have undertaken to enlighten him. Such information tends to give the public the proper idea, namely, that not all of the nickels taken in are paid out to stockholders, but that only a very small part is used for that purpose. Another matter, not properly exploited heretofore, is the giving of information as to the rerouting of cars, necessary new rules, and other operating news which patrons are entitled to receive. In days gone by companies were too prone to withhold explanations if they were not able to grant requests for changes in service, or better service from communities or organizations. We were overlooking the best avenue of becoming acquainted with our customers, by not using printers' ink.

In the past ten years, however, most companies have been converted to the use of printers' ink, and it is an exceptional one to-day that does not give its patrons the fullest information as to the "why and wherefore" of all matters in which patrons are interested. In most large cities street car advertisements appear with nearly the same regularity as those of retail stores. Some companies even print daily delay statements, showing the causes for delay of cars, and this helps to produce a better feeling toward the company. The public is told, without being obliged to ask, why the cars were late on certain occasions. Undoubtedly all such publicity creates better public feeling and is reasonable and proper. Clearly, we are doing a wise thing to give such information as to operation as the public should receive.

But, assuming that publicity is valuable, is it not possible to overdo it, and to feel that all of our troubles can be cured with a liberal use of newspaper space and printers' ink? Are not some of us inclined to believe that if one column of newspaper space is a good thing, then three columns are much better, and a whole page is better still? Does not the constant use of large newspaper space to give information that could be covered just as appropriately in much smaller space, tend to give the public the idea that we are trying to bolster up a losing cause, that we have something to be constantly defended? One sometimes sees street car advertisements occupying whole pages of newspaper space which would ordinarily occupy a quarter that space if they had been inserted by shrewd department store managers. While the argument that a large advertisement is more conspicuous may be advanced, I believe there is a psychological point involved. Is the reader not more likely to infer that we felt that we had to "shout so as to be heard" when we use so much space?

Many companies have conducted "campaigns of publicity" to debate certain questions with their communities. I have watched these campaigns and have often wondered if they always accomplish the purpose for which they are intended. Sometimes it would seem as if these "campaigns" would irritate the reader as readily as they would convince him. Perhaps bombastic in spirit and superlative in phrase, these daily or periodic page advertisements have sometimes taken on a tone much more likely to offend the reader than propitiate him. Are we not going too strongly on the theory that publicity is a medium which can cure all of our ailments, and that the more liberal doses we take the healthier we shall be?

Publicity is not necessarily confined strictly to the use of newspaper space, although when we speak of publicity we usually mean newspaper advertising. In its largest and broadest sense—that of making things known to the public—publicity, whether by the use of newspaper space or of other mediums, is a good thing for the street railway business. It can serve us admirably in many ways. It can educate the passenger and give him a real idea of our side of each question. It can explain our point of view to him intelligently in a way that our conductors or motormen cannot do, and in a way, indeed, that even general officials of a company cannot do, because unfortunately general officials cannot come in close contact with the mass of the public each day. Publicity is like a huge megaphone, but does it not defeat our purpose when we are constantly shouting through the megaphone explaining our business and really taking on a defensive tone when the need to do so may not exist?

The older one grows the less one relishes controversy. We Americans are not strong for war even though we buy newspaper "Extras." Someone has said that fights never settle anything, and so I wonder whether the controversial encounters which so many companies have with their communities, or with local newspapers, settle the questions under discussion. Have any of these campaigns cleared the atmosphere or made friends in any way? Personally, I do not think that it is good policy for a company to keep up a continual open warfare upon its real or imaginary enemies, or upon those who have the temerity to criticise it. The public soon gets weary of this sort of conflict. The main thing that it behooves a company to do is to put its house in order if not already in order, and keep it so. The public will then have greater confidence in the company's sincere purpose to do the right thing.

If every employee of a company, from the highest to the lowest, can be imbued with the spirit of doing his level best every day to please the public he is trying to serve, to receive with an open mind suggestions for the betterment of service and to comply with reasonable requests, I am sure that "campaigns of publicity" will not often be necessary. Perhaps we can establish such cordial relations with the majority of our patrons by fair dealing of this sort as to prevent the frequent rise of irritating issues between the company and the public. Publicity in its proper way, at the proper time and in good humor, is a good tonic for all of us. But it will never cure all of our ailments, solve all of our problems and, as a sort of patented contrivance, settle all our troubles.

However, in the words of an old philosopher, "I may be wrong."

PRINCIPLES UNDERLYING PUBLICITY

By IVY L. LEE

Executive Assistant Pennsylvania Railroad Company

ELECTRIC railway managements are suffering from the same malady as that which afflicts the steam roads, namely, misunderstanding and distrust. Both troubles, and of course the latter is but a consequence of the former, are due in large measure to the failure of railway managements to make it a part of their policy and their every-day work to remove causes for present misunderstanding and to avoid giving cause for future criticism. Of course, there are substantial causes for criticism of transportation managements —it is not by any means all due to misconception. Grave wrongs have been committed—mainly in financial operations—and if these and other wrongs are to be repeated there is no hope that better conditions will be brought about either by means of "publicity" or in any other way. Publicity cannot be used as a screen for wrongdoing; it is a means for disseminating facts to the end that a right conception of conditions may be substituted for distorted ideas.

It should be possible for a railroad to set itself right with the public merely by cold statements of fact. But it is not, and even cold or warmed-over statements are often lacking. What the public wants is a window through which it can look into the affairs of public service corporations. And so long as this vision is denied the public will be very suspicious as to what is going on in the windowless houses of steam and electric railways.

As I have ventured to point out to members of the branch of the transportation industry with which I am connected, railway men seem to be divided into four groups:

First there are those who believe that the crowd on the outside has no right to see what is going on on the inside, and that there is no reason why there should be any windows.

Then there is another class who have no objection to windows being in the buildings, but think that even if the public could see what was going on inside, they would not be in the least affected in their attitude toward the business.

There is also a third class who believe it would be a good thing if the public could look in and see what is going on, but they do not believe there is any human method of making the public do the looking.

And finally, there is a fourth class who believe in the windows, who believe in the public, and who are making great progress toward a better understanding on the part of those both inside and outside the building.

> **"What the public wants is a window through which it can look into the affairs of public service corporations. And so long as this vision is denied the public will be very suspicious as to what is going on in the windowless houses of steam and electric railways."**
>
> *—Ivy L. Lee.*

Somehow or other the public has come to have the idea that three essential evils are imbedded in the railroad business:

1. That there is a vast amount of watered stock on which dividends are being paid.

2. That there is a widespread feeling that the railroads are ruled from Wall Street, that a small coterie of bankers in alliance with the so-called "money trust" are absorbing huge profits from the people.

3. That the railroads through their combinations of capital and management exercise undue power over the welfare of the people. With respect to electric railways, there is often a feeling that this

> **"We must imbed in the public mind what is in all truth the supreme fact of the situation, namely, that the railroad men are doing their work as best they can and, in the main, doing it exceedingly well. As soon as the public becomes convinced of that fact, it will give the railroad men opportunity to go ahead at full steam, or on the last notch of the controller."**
>
> —*Ivy L. Lee.*

power is used locally against the welfare of the public, and out of this grows the demand for municipal ownership.

That there has been some reason for some of these popular ideas no one can deny. But that transportation as a whole or in the main has been conducted upon unsound lines, that its managers have not been honest, and that its results have not contributed mightily to the wonderful progress of this land, can be emphatically denied.

Why is it, then, that the good in the railroads has been hidden and the bad magnified and distorted out of all proportion? It is because railroad men have neglected the human nature of the situation; it is because loud-voiced politicians have dilated upon the evils while railroad men have not insisted in and out of season, and produced facts to prove that, no matter what fly-specks might be pointed out on the wall, the structure itself was safe and solid.

There is no gain in pointing out the logical inconsistencies of other people's arguments. If we cannot answer what they say with something that will appeal constructively to the imagination or emotion of the public, with something that will supplant the erroneous statements, it is hardly worth while to go into the case at all. We may say what has been said of a woman, that a crowd convinced against its will "is of the same opinion still."

A public to be influenced must feel. Too many railroad announcements are full of cold legal phraseology; they do not make the public feel. To make the public feel, we must be concrete; we must tell of our work in language the layman can understand. He will not analyze figures. What he wants to know is, are you doing the best you can? Convince him of that, and you don't need to argue details.

This necessity to be concrete argues against the establishment of any general publicity bureau. Each railroad should tell its own story to its own constituency. No set of statistics, no generalization as to the facts concerning the railroad as a whole, however convincing, will ever find lodgment in the public mind. But our own story, of how each railroad is performing its obligations to its own community, will always be of interest. And it is here that we must deal with the press. It seems to me we should regard the press simply as the window-glass of this house in which, as I conceive it, we have cut out the space for the windows. It is the glass through which the public can see what we are doing. That glass should be clear; it should not color; it should not distort. Therefore, we should make an effort to see to it that what the press publishes about us consists not merely of complimentary notices about our roads and about our officers, but facts of consequence. We should see to it that the public learns the truth in all matters, but we should take special pains to see that it learns those facts which show that we are doing our work as best we can, and which will create the idea that we should be believed in. We must get so many good facts, so many illuminating facts, before the public that the bad will be overlooked. There will always be some bad facts in every business, as long as human nature is frail.

Do not misunderstand me. Nothing is further from my thoughts than to suggest any attempt to prove things are good which are really bad. No one should condone the bad, and it should be, as I believe it is, the constant aim of nearly every railroad man to make things better. What I do mean is that we should not neglect the human nature of the situation, but should take full advantage of it; that we should tell our story, tell it frankly, tell it fully, tell it with a view to its being understood, and make it carry conviction as to the essential truth.

Unless the railroad men of the country are to be believed in, so that the public will take their advice as to what it should do with reference to railroads, we are not going to make very much headway in the settlement of the railroad problem. The railroad men of this country deserve public confidence, and they must command it.

The extraordinary situation which now prevails, however, is that railroad managers are representatives of one-eighth of the tangible wealth of the United States, yet not a single man with experience in railroad management is on the Interstate Commerce Commission; none is on any of the state commissions.

If we are going to work out this problem properly we must have the confidence of the public. We must imbed in the public mind what is in all truth the supreme fact of the situation, namely, that the railroad men are doing their work as best they can and, in the main, doing it exceedingly well. As soon as the public becomes convinced of that fact, it will give the railroad men opportunity to go ahead at full steam, or on the last notch of the controller.

The crowd craves leadership. If it does not get intelligent leadership, it is going to take fallacious leadership. We know that the leadership which the mob has received not only in this country but in other countries, unless corrected, is going to produce disastrous consequences. Is it not supremely worth while, therefore, that railroad officials should take account of those fundamental undercurrents of human nature, take practical steps to obtain the confidence of the public and assume the leadership which by right of character and ability they are entitled to exercise?

In the electric railway field there are doubtless a large number of officials who profess to believe in publicity but who have been very slow in putting their belief into action. This may in part be due to failure to understand the principles of publicity and how the work is to be done. An attempt to state the underlying principles of publicity and the need for it has been made in the preceding paragraphs. As to methods, they are as various as differing occasions demand. Of course, the daily press is the most immediate means of communication, but in some noteworthy cases pamphlets and bulletins have been equally effective. Public speaking is another potent means of reaching the people. Methods of publicity cannot be described in advance of their application. The management that waits for someone to say exactly what he is going to do throughout a continuous publicity campaign will never get started. The best plan of campaign is to get the best possible man and put him to work studying the problem and working it out.

BUILDING UP CONFIDENCE IN A PUBLIC UTILITY

By JOHN A. BRITTON

Vice-President and General Manager Pacific Gas & Electric Company

OHM'S law is expressed by the well-known equation $C = \frac{E}{R}$. This equation may be taken to express the title of this article—that confidence equals earnestness divided by results.

Building up confidence in a public utility would seem to be no great or Herculean task, if, on the common plane of ordinary transactions between individuals, the public utility is reduced to the same public footing as any other commercial or mercantile enterprise. Building up in its true sense contemplates a beginning from the very foundation; it means a stable and substantial structure and not a house of cards; it means that the materials entering into the structure so to be builded must be of the very highest class in construction.

Building up is the antithesis of tearing down, and yet the tearing down process, in so far as the public utilities are concerned, has been the rule rather than the exception in the latter days. The tearing down process has resulted from a very lack of confidence in utilities, a lack which has been engendered not so much by the daily routine employed between public utilities and their consumers as by the building up of false premises by a few financial managers of corporations in times past.

Before regulation was begun many public enterprises were builded on very insecure foundations, and the enticing profits arising from the manipulation of utilities made a field for promoters not to be resisted. They were careless of future results, and such a thing as endeavoring to secure the confidence and good-will of their patrons was a secondary consideration. As long as the people would pay the price, the corporations pursued their unheeded way, and while public utility managers deserve a great deal of credit for the progress which they have made, particularly for their wonderful pioneering work accomplished in the days of apparently insuperable and insurmountable difficulties, it must also be said that in the wild scramble for great gains, the eventual necessity of building up confidence in the public was largely forgotten, if not eliminated. It is true that charges of property mismanagement can honestly be made only against a very few, but they were of a sufficient number that the whole body-politic of public service corporations became enmeshed in these intricacies of finance and exploitation, and when the day of reckoning came and the necessity for the arrest of such developments as placed burdens upon the public arrived, all corporations of this class were placed in the category of the get-rich-quick concerns. The result is that many to-day are suffering for crimes they did not commit or even consider.

When regulation—sane and insane—came to the front, the penalty had to be paid; and while in the majority of cases public service corporations in the United States enjoyed the confidence of their consumers, such confidence was immediately dissipated by the general thought, engendered by a hostile press, that all public utilities were in league in the game of extortion. Nothing has become more important during the past few years for the public utilities than to seek to correct this very false impression, and by the process of ordinary common sense dealing to seek again to restore the confidence which had been lost.

The one element most strongly entering into the work of building up confidence in a public utility is the personal equation of the men having control of the policies of these utilities. "Like master, like

"Public service managers are now beginning to realize that the greatest asset which a public utility possesses is the absolute confidence of the public with which it deals."

—*John A. Britton.*

man" is a true saying, and more nearly true perhaps in the attitude of public service corporations towards the public than in any other line of trade.

Considered fundamentally, there is no material difference between a public utility offering for sale a manufactured product or engaged in the business of transportation and the merchant in a community who manufactures or delivers his products to consumers. The difference which does obtain is created by law and is founded on the theory that a public utility possesses rights and privileges in a community not possessed by other individuals, such as the general occupancy of the streets of the city, either by a constitutional right or by franchises legally granted to it by municipalities or any governing body.

In its use of the streets a public utility practically occupies no greater portion than does the ordinary public in the daily occupation of merchandising, but because it disturbs the surface of streets and uses the sub-surface for storage of its distributing systems and the space allotted to it in public highways for the erection of structures for conveyors of its products, it becomes at once a public utility subject to rules and regulations such as are not imposed upon merchants, who, by means of vehicular traffic and by utilization of subways attached to buildings, very often use more of the public streets and cause more destruction to them than do the public utilities. However, having placed themselves in the position of becoming amenable to the laws regulating public utilities, these companies are subject to more drastic regulation than is any other class of business, and for that reason, particularly, a public utility should be more consistent and careful in its relations with the public than should an ordinary merchant.

All public utilities are natural monopolies, and prior to the adoption of lenient laws by states and municipalities to promote a larger competitive condition, were essentially such, due to the vast amount of capital necessary for the exploitation of their business, and in the exercise of this monopoly they followed the impulse of man and beast since the beginning of time—to exercise arbitrarily the powers which they possess over others and thereby engendered class hatred as between the utilities and the public served. Competition has served, however, to break the strong bonds of the monopoly formerly cherished, and to-day public utilities are seeking to obtain the good favor and confidence of their consumers, by making the public their confidants and by exposing to the public the inner workings of what were once mysterious organizations. Regulation by the establishment of commissions with control over public utilities has been the instrument which has brought this about more than any other one thing, and public service managers are now beginning to realize that the greatest asset which a public utility possesses is the absolute confidence of the public with which it deals.

We can learn a lesson in the proper procedure of gaining this confidence from the retailer in any community, who, once he possesses an article of intrinsic merit and whether he is protected by a monopolistic right of sale or not, cultivates daily, through the medium of the press and the attitude of his employees, the confidence of the public in the integrity of the article which he sells and in the prices which he seeks to maintain for the goods that he displays.

True confidence in a public utility can be built up only by such exchange of confidence with its patrons; not only by the integrity of its goods but by the integrity of its prices, and by that is meant a service which from day to day is alike in character and is sufficient to meet at all times the demands of the public and is reasonable from the standpoint of a just return on invested capital. Public utilities should pay courteous attention to complaints of consumers and should have the attitude of the men brought into contact with the public always along the line of giving the consumer the benefit of every doubt that exists and not arbitrarily standing upon what they deem their natural or legal rights.

The confidence of the public cannot be purchased. It can only be gained by the kind of treatment that a reasonable person demands from another in the ordinary daily walks of life. The man who stands upright before his fellow men and the one whose word is accepted is the one who has always kept his promises, no matter how detrimental at times it might have been to him to have maintained such promises, and by a truthful declaration of both his rights and his wrongs has taught the public to believe implicitly in him.

In these days of intense development of activities to serve the vast hordes that congest our central marts of trade, it is more than necessary that the public be advised constantly by the utilities of just what their position is as regards service, as to what the service costs and as to what investment is required for the giving of such service. The ordinary consumer has a very general idea of the value of the products that go to make up the things that he essentially needs, and competition in trade in the luxuries of life force him into the position of knowledge of approximately the value of such luxury. But of the service of the public utility he is as ignorant as is the negro of Africa of the classics of Greece. A combination of capital when applied to a public utility is always looked upon by the individual as a means to the end of depriving him unjustly of his money. He should be told in no uncertain terms, by proper publicity, of the contribution that is daily made by the public utilities for the upkeep of its service, the amount which it expends for labor, material and supplies, and of its contribution to the national, state and municipal governments for taxes upon the utility, and the amazingly small return that is left for the benefit of those who have invested their money.

When from time to time, through the medium of the public press to the public, unwarranted statements are made that reflect upon the integrity of the public utility and its management, the public utility man should never cease to refute them, and he should not accept, as he has quietly done in the past, the opprobrium that has been heaped upon him merely because he represented a public utility.

With these things in mind the creation of confidence in the public will be very speedily attained, and the public utility business will get to be considered as fair and as honest as any mercantile or manufacturing business, and the foundation upon which this confidence will then be builded will have been securely laid and will support the structure of harmonious relations.

FIVE YEARS' DEVELOPMENT OF THE AMERICAN ELECTRIC RAILWAY

By FRANK R. FORD

Ford, Bacon & Davis, New York

THE preliminary report upon street and electric railways for the calendar year 1912, recently issued by the Bureau of the Census of the United States, in connection with the statistics of similar reports for 1907 and 1902 makes possible a study of the amount and character of the development of the electric railway industry during these two five-year periods, subject only to the limitations of these reports.

A similar review of the 1907 reports, made in 1910 showed the distinct tendency of diminishing profits at the 5-cent fare. Consequently, it is of interest to determine whether this tendency has continued or whether the economies which were made necessary by reduced profits have been sufficient to overcome the earlier losses.

The effect of diminishing profits of the earlier period upon the expansion of electric railway facilities and investment during the later period is also an interesting inquiry.

Are Profits Still Diminishing? The answer to this question will be found in the income account of which a condensed summary is given in Table I.

From this table it will be noted that the total revenue has considerably more than doubled in ten years and now reaches the enormous total of $585,930,517. The increase in transportation revenue, however, from 1907 to 1912 is only $129,908,426, compared with the increase from 1902 to 1907 of $154,279,342. The percentage increase of the later period of 33.3 per cent is approximately only one-half of the increase of the earlier period of 65.4 per cent. This decreased rate of increase has been due to the financial depression following 1907 and also to the general recognition of diminishing profits of the business, resulting in a smaller rate of expansion and investment.

One of the evidences of thrift in the operation of these properties and of the fact that other businesses, notably electric light and power, are more profitable, is the large increase for 1912 of non-transportation revenue and income from other sources.

Maintenance charges have increased more rapidly than revenue, which indicates better upkeep; transportation expenses have increased in about the same proportion as revenue, while general expenses, including management and accidents, have increased much less than revenue and are only slightly larger than 1907. Taxes, however, have increased at more than twice the percentage of revenue increase.

Interest on funded debt for 1912 has increased faster than revenue and in larger ratio than dividends. The decrease in surplus may be accounted for partly by the fact that while in 1912 charges are made against operating expenses for depreciation, in the earlier periods the surplus was partly accumulated or earmarked for that purpose.

A regrouping of the total operating expenses is given in Table II. This table is based on the assumption that after deducting from total operating expenses the cost of salaries and wages, purchased power, depreciation, insurance, rent and three-fourths of the expenditures for injuries and damages (as one-fourth of the latter are estimated to be included in salaries and wages), the balance represents the expenditures for materials and supplies.

These figures show that the cost of labor has increased in approximately the same proportion as revenue, so that in this largest single item of expense practically no economy has been possible even with the larger volume of business. In materials and supplies a distinct saving in percentage of revenue has been effected, although here again doubtless some of the expense has been shifted to purchased power, which accounts for the large increase of the latter.

Salaries and wages are shown in more detail in Table III.

The salaried employee and the wage earner from 1907 to 1912 have received only a small increase in rate of pay, 1.8 per cent and 2.4 per cent respectively, which is a striking commentary on the general necessity for prosperity in any business to make possible large increases in wages.

The amount spent for materials and supplies is approximately as shown in Table IV. These figures reflect a material economy.

TABLE I—COMPARATIVE INCOME ACCOUNT OPERATING AND LESSOR STREET RAILWAYS OF THE UNITED STATES

	1902	1907	Increase over 1902, per cent	1912	Increase over 1907, per cent
Operating revenues:*					
Transportation revenue	$235,997,005	$390,276,347	65.4	$520,184,773	33.3
Non-transportation revenue	11,556,994	27,911,511	141.5	47,326,931	69.6
Total operating revenue	$247,553,999	$418,187,858	68.9	$567,511,704	35.7
(Total revenue, including income from other sources)	($250,504,627)	($429,744,254)	(71.6)	($585,930,517)	(36.3)
Operating expenses:					
Maintenance of way and structures	$13,600,236	$28,520,925	109.5	$42,666,174	49.6
Depreciation of way and structures	....	....	....	3,705,511	....
Maintenance of equipment	16,676,532	31,485,810	88.8	36,386,002	15.6
Depreciation of equipment	....	....	....	3,670,376	....
Total maintenance	$30,276,768	$60,006,735	98.2	$86,428,063	44.0
Traffic	$1,122,816	$1,730,851	54.2	$2,606,057	50.6
Superintendence of transportation	$2,598,935	$3,545,418	36.4	$7,127,204	101.0
Power	23,062,328	43,972,669	90.7	60,484,917	37.6
Operation of cars	58,373,804	93,577,263	60.3	122,077,311	30.5
Total transportation	$84,035,067	$141,095,350	67.9	$189,689,432	34.4
General and miscellaneous†	$26,877,946	$48,476,316	80.5	$54,172,804	11.8
Total operating expenses	$142,312,597	$251,309,252	76.6	$332,896,356	32.5
Taxes	13,078,899	19,755,602	51.0	35,027,965	77.3
Total operating expenses and taxes	$155,391,496	$271,064,854	74.4	$367,924,321	35.7
Net earnings	$92,162,503	$147,123,004	59.6	$199,587,383	35.7

Per car mile (cents)	7 05	8.54	21.1	9.09	6.4

TABLE IV—MATERIALS AND SUPPLIES (APPROXIMATE)

	1902	1907	Increase over 1902, per cent	1912	Increase over 1907, per cent
Total	$39,023,743	$67,467,385	72.9	$76,376,978	13.2
Per cent of operating revenue	15.76	16.13	2.3	13.48	—16.4
Per car mile (cents)	3.40	4.17	22.6	3.98	—4.6

TABLE V—EFFICIENCY OF OPERATION

	1902	1907	Increase over 1902, per cent	1912	Increase over 1907, per cent
Car mileage per car owned	17,150	19,300	12.5	20,400	5.7
Passengers per car owned	87,200	114,000	30.7	129,000	13.2
Per cent transfer passengers of revenue passengers	22.3	26.8	....	25.4	....
Operating revenue per mile of track	$11,000	$12,200	10.9	$13,800	13.1
Operating revenue per car mile (cents)	21.6	25.8	19.4	29.5	14.3
Operating expenses per mile of track	$6,320	$7,320	15.8	$8,100	10.7
Operating expenses per car mile (cents)	12.4	15.5	25.0	17.3	11.6
Operating expenses per cent of operating revenue	57.5	60.1	4.5	58.7	2.3
Operating revenue less operating expenses per mile of track	$4,680	$4,880	4.3	$5,700	16.8
Operating revenue less operating expenses per car mile (cents)	9.2	10.3	12.0	12.2	18.4

The smaller rate of revenue increase and the necessity of economy have produced more efficient operation, as will be seen from Table V.

From these figures it will be noted that a larger mileage has been operated and more passengers carried per car than heretofore. The operating revenue per car mile has also very considerably increased from 25.8 cents to 29.5 cents, due somewhat to larger cars, while the increase in operating expenses during the same period is only from 15.5 cents to 17.3 cents, producing a notable increase of net earnings from 10.3 cents to 12.2 cents.

But most important of all, the ratio of operating expenses to operating revenue has actually decreased from 60.1 per cent in 1907 to 58.7 per cent in 1912, or to almost as low a figure as the 57.5 per cent in 1902. This is the more important when it is considered that the operating expenses for 1912 contain $7,375,887 charged for depreciation compared with no similar charges for the earlier years.

Another interesting feature is that the percentage of revenue passengers transferring shows a slight reduction from 1907, due to a better understanding of the expensive nature of this free service.

When the income account is reduced to a car mileage basis the results shown in Table VI are obtained.

The operating revenue received by the street railway industry was expended as shown in Table VII. The interesting feature of this table is that in spite of an increase of 0.9 per cent of operating revenue

TABLE VI—INCOME ACCOUNT IN CENTS PER REVENUE CAR MILE

	1902	1907	1912
Operating revenue	21.6	25.8	29.5

Surplus	60	33	—45.0	18	—45.6
Total for capital	$377	$350	—7.2	$332	—5.1

CONCLUSIONS

"From the above statistics it is possible to draw certain general conclusions:

"The business, as a whole, is being operated more economically and conservatively.

"Maintenance and depreciation of property are being better provided for.

"Increased net earnings due to more efficient operation are being largely absorbed by increased taxes.

"Capital is receiving a slightly enlarged return, but the increase is too small to be attractive in comparison with the returns in other industries.

"Development of and investment in the industry are not keeping pace with the increase of traffic."

—*Frank R. Ford*

being put back in the maintenance of property in 1912 and a decrease of operating ratio from 60.1 per cent to 58.7 per cent, resulting in 1.4 per cent more revenue saved for net earnings before taxes, this entire saving was paid as taxes, and the final net earnings after taxes were the same as in 1907. In other words, practically all the increase of net earnings expressed as a percentage of revenue, due to increased efficiency of operation, was absorbed by increased governmental charges.

TABLE IX—INTEREST AND DIVIDENDS PAID

	1902	1907	1912
Interest on funded and floating debt	$46,462,470	$81,771,266	$113,259,470
Per cent of debt	4.68	4.17	4.31
Dividends	$33,039,171	$54,485,274	$70,992,218
Per cent of stock	2.51	2.60	2.97
Total	$79,501,641	$136,256,540	$184,251,688
Average per cent of capital and debt	3.44	3.36	3.68

Restated in another way, each $1,000 of total revenue was expended as shown in Table VIII. From these figures it would appear that both labor and capital show a decreased return in 1912 expressed in percentage of revenue, this being largely due to increased taxation.

TABLE X—COMPARISON OF CAPITALIZATION

	1902	1907	Increase over 1902, per cent	1912	Increase over 1907, per cent
Funded and floating debt	*$992,709,139	$1,960,050,142	97.4	$2,626,482,670	34.0
Ratio to total revenue (times)	4.0	4.5	...	4.5	...
Capital stock	$1,315,572,960	$2,097,708,856	59.4	$2,384,344,513	13.7
Ratio to total revenue (times)	5.2	4.9	...	4.1	...
Total capitalization	$2,308,282,099	$4,057,758,998	75.7	$5,010,827,183	23.5
Ratio to total revenue (times)	9.2	9.4	...	8.6	...

*Funded debt only; floating debt not available.

TABLE XI—EXPANSION OF FACILITIES AND INVESTMENT

	1902	1907	Increase over 1902, per cent	1912	Increase over 1907, per cent
Miles of track	22,573	34,382	52.3	41,065	19.4
Number of cars (owned)	66,784	83,641	25.2	94,016	12.4
Total capitalization	$2,308,282,099	$4,057,758,998	75.7	$5,010,827,183	23.5
Transportation revenue	$235,997,005	$390,276,347	65.4	$520,184,773	33.3

The actual interest and dividends paid on debt and capital stock have been as shown in the figures in Table IX.

While the rate of interest in this table shows the slight increase of from 4.17 per cent to 4.31 per cent, the rate of dividends shows a slightly larger increase from 1907 to 1912 of from 2.60 per cent to 2.97 per cent on par value, and from this standpoint the owners of these properties have profited by the betterment and economies of operating conditions.

The increase of capital as compared with increased revenue is shown by Table X to be in a conservative direction, the total debt and stock in 1912 being 8.6 times the total revenue, compared with 9.4 times in 1907.

A decrease in amount of development is shown in Table XI.

It will be noted from the figures in this table that the increase of track mileage from 1902 to 1907 was 52.3 per cent and only 19.4 per cent from 1907 to 1912, and that the rate of increase in cars owned was about half as much for the latter as for the earlier period. Similarly, new capital issues increased only 23.5 per cent for the five years to 1912, compared with 75.7 per cent for the earlier period.

All of these rates of increase for five years to 1912 were considerably less than the 33.3 per cent increase of transportation revenue.

CONCLUSIONS

From the above statistics it is possible to draw certain general conclusions:

1. The business as a whole is being operated more economically and conservatively.

2. Maintenance and depreciation of property are being better provided for.

3. Increased net earnings due to more efficient operation are being largely absorbed by increased taxes.

4. Capital is receiving a slightly enlarged return, but the increase is too small to be attractive in comparison with the returns in other industries.

5. Development of and investment in the industry are not keeping pace with the increase of traffic.

POPULARITY OF ELECTRIC RAILWAY SECURITIES

By ALLEN G. HOYT
N. W. Halsey & Company, New York

MANY explanations have been offered as to why the investing public during the last few years has been turning to the securities of public utility companies in preference to those of steam railroads and industrials, but there are two which probably have had a great deal to do with this tendency. One is the comparative stability of the earnings of these properties, and the other is the immunity which experience has shown that they enjoy against confiscation.

There is no doubt that public utilities have a stability of earning power that is equal to, if not better than, that of any other class of corporations. This subject has been widely discussed in current periodicals, and detailed arguments thereon are unnecessary. But it is interesting to note that during 1913, according to the report of the comptroller of the currency, the 26,000 banks of this country increased their holdings in public utility bonds by $118,000,000 and released $101,300,000 of steam railroad bonds. This is a rate of gain for public utility bonds larger than ever before. Even such a world catastrophe as the European war should have little effect upon the earning power of these properties. There may be some sentimental or sympathetic reaction in prices or a temporary decline caused by a rapid foreign liquidation, but the stability of the issues as regards permanent investment will not be impaired.

> **"There is no doubt that public utilities have a stability of earning power that is equal to, if not better than, that of any other class of corporations."**
>
> —*Allen G. Hoyt.*

The second reason mentioned for the investment popularity of electric railway securities—which they enjoy in common with other public utilities—is their immunity from confiscation. By this is meant that public service commissions or other regulatory bodies cannot reduce the rates or fares of these properties to the point of confiscation. While the subject of appraisals is not yet on a completely standardized basis it has progressed sufficiently far in that direction that the investment value in these properties is generally recognized and protected. Commissions have also generally held that rates must be such as to afford a reasonable and fair return on this investment value. The principle of the economic desirability of monopolies in the field of public utility service has also been widely accepted by commissions and has been carried to the extent of refusing permits for the organization of rival companies. For this reason public utilities are practically exempt from the danger of ruinous competition. These facts enable bondholders in such companies to determine easily the safety of their investments. Steam railroads have not in general been able to establish their investment value to an equal extent, for there is not yet a sufficiently standardized basis upon which to work.

Electric railway investors are also protected to a large extent against the mistakes of public service commissions, made either unwittingly or through over-zealousness in the so-called interests of the public. Commissioners are beginning to see that when they appraise a public utility property and decide upon a reasonable return, the public will eventually suffer if the rates are not high enough. With the higher standard of living, people desire better public utility facilities. To provide adequate facilities the corporations require additional capital from time to time, but the necessary capital will not be forthcoming unless the commissions permit the companies to charge rates which will show an attractive return on the investment value of their property.

Some scheme must be devised which will allow the capital invested in a public utility to make increased returns as the corporation prospers, whether its prosperity is due to exceptionally able management or is the natural result of the increase in wealth and population of the community served. The Wisconsin scheme, the so-called Massachusetts idea and the Chicago Traction plan, all recognize this phase of the situation.

It cannot be denied, of course, that the hazards of electric railways are still many. Even if there is little threat of private competition there is the actual and potential danger of municipal lines, and there is a continued increase in operating expenses, despite constant watchfulness and increased efficiency. There are also the growing burdens of labor, taxes, enforced extensions and hostile political attacks of one kind and another. But these facts do not destroy the stability of electric railway securities; they are simply points about which the investor should be cautioned. They have been largely overcome in the past, and undoubtedly the same will be true of the future. The electric railway business as a whole is now organized on a firm foundation that makes its issue of securities among the most attractive that are available in the market.

IMPROVING THE ATTITUDE OF THE PUBLIC TOWARD THE TRACTION COMPANY

By EDWIN GRUHL

Assistant to the President, North American Company

THE recent interest in the desirability of traction companies cultivating better public relations has raised the question as to the most practicable means and the possibility of concerted action upon the part of all traction companies to achieve that end. The need for some plan of action arises principally from two sources:

(a) The constantly increasing demand in many communities for extended facilities and better service must ultimately be accompanied by increased earnings if returns upon the investment are to be sufficient to attract new money into the public service. In many instances this question of increased revenues has already become as pressing as the similar problems now being faced by the shippers and the railroads. It is necessary that the public be advised in time as to the importance of its interest in obtaining new capital in order that the proper co-operation may ultimately be secured to remedy existing revenue conditions.

> **"The fact that under regulative laws the utility's affairs are public information has apparently not lessened notions prevailing in many communities that the business is abundantly profitable and that the cost of service is far below the rate of fare paid by the public. Unfortunately these views are not altogether due to public ignorance but are frequently voiced by people who ought to know better."**
>
> —*Edwin Gruhl.*

(b) Unfortunately the best public relations are not always promoted alone by careful conduct of the business. The traction utility, occupying as it does a position in the public streets, is particularly subject to unwarranted complaints. Unless such complaints are promptly dealt with they are very easily extended into widespread sources of dissatisfaction. Attacks on public utilities are, moreover, still employed by public officials for political purposes and are still one of the various indignation topics used by many editorial writers to promote interest in their newspapers. With the best conducted utilities, therefore, adverse criticisms still occur at more or less frequent intervals.

Until recently few utilities have paid attention to public policy campaigns. It is not many years ago that publicity of accounts was expected completely to fill the requirement of preventing any misunderstanding as to the fairness of the utility in dealing with the public. But publicity of the business, even when coupled with the vast inquisitorial powers of regulating commissions, has, in itself, failed to produce good public relations. The public has no interest in the usual financial statements and statistics, because it is at a loss to interpret their significance. It is impressed with the magnitude of the net earnings, but has no inclination to associate that sum with the investment. The figures involved are usually beyond the ordinary individual experience, and there is almost a universal tendency to desire an opportunity to distribute other people's money. The fact that under regulative laws the utility's affairs are public information has apparently not lessened notions prevailing in many communities that the business is abundantly profitable and that the cost of service is far below the rate of fare paid by the public. Unfortunately these views are not altogether due to public ignorance but are frequently voiced by people who ought to know better.

It also seems certain that occasional newspaper campaigns stating the utility's case have not secured desirable results. Frequently such campaigns have been postponed until public antagonism has become acute. As a result the utility's motives have been questioned and the sudden attention to publicity taken as a confession of weakness. It is difficult to induce prejudiced people to accord the utility a hearing, much less read lengthy advertisements. While public prejudice is easy to create and foster, it is evident that convincing the public is a more gradual process.

Obviously, no definite plan of procedure can be devised which will fit any local condition. In some instances the transportation of working people to and from their places of employment, in others the ambitions of real estate owners in outlying districts for the speedy development of their property through extensions of the traction company's lines, are the immediate sources of dissatisfaction. In some communities, also, public opinion is centered around the need for industrial expansion and a bigger city; in others it is concerned with the high cost of living, and the regulation of profits and municipal ownership are topics of public discussion. In the more conservative cities, a definite program for public improvements, health, education and economy and efficiency in city administration receive a more popular response than general plans for social reform after a thorough upheaval of existing conditions. Where public sentiment is most rational, and hence the most readily convinced by a campaign of education, the pressing problems of good city administration occupy so much public notice that there is no necessity for a public policy campaign. It is only possible, therefore, to outline in a general way the means for bettering public relations.

As a part of the "public policy" of a traction company the treatment of individual complaints is important. The managements of most companies encourage well-founded complaints, and handle them courteously and with dispatch, stating the means taken for correction, pointing out where the public must co-operate and correcting any misstatements. The handling of the unwarranted complaint requires greater tact and patience. Every community has its number of habitual complainants who are not open to reason and whose only certain convictions, in fact, are based upon vague ideals impossible of attainment. In such cases the only result which it can be hoped to achieve is the reduction of this class of complaints to the smallest possible number. The writer of anonymous public letters to the newspaper presents another difficult problem. In a number of instances such sources of dissatisfaction have been stopped and the letters diminished in number by requests to the press to permit reply by the company in the same issue.

The company's policy towards the settlement of accident claims is also important. The prompt settlement of claims where such have merit, and the restriction of litigation to only such cases where the company is not responsible, often has a far-reaching effect upon public sentiment.

Educating the public to the traction company's problems has in many instances supplemented the efforts made to dispose of individual complaints. Such educational articles may include topics of historical interest reminding the public of the pioneering work and improvement in the art which have occurred, the great changes in the character and length of transportation, the growth of transfer privileges and of rush-hour service and their influence on the cost, and the smaller purchasing power of the nickel. Significant conclusions may be drawn from comparisons of the rise in price of other items entering into the average citizen's cost of living as compared with the stationary rate of fare. The schedule of subjects may also include topics illustrating the mutual interest of the utility and the public in promoting the growth and prosperity of the community, in observing the company's rules, in encouraging the movement for public safety, and in minimizing taxation and similar assessments which must ultimately be borne by the patron.

> **"The problem of unsettled public relations is apparently one of the risks inherent in the traction business which careful local treatment may minimize, but to which no single general plan is applicable."**
>
> —*Edwin Gruhl.*

Frequently, as local conditions may determine, the tenor of the educational article must be such as to appeal to other business men and must deal with the more general economic problems of the industry, correcting prevailing notions as to rates of return at which securities will find a market, as to the traction business being one of increasing returns, as to the incidence of public utility taxation, and as to the form of government necessary to insure the success of municipal ownership and administration in the form and under the conditions as practiced abroad. While many commissioners understand that a high rate of return on capital is necessary to attract the money required into the business, the ordinary professional or business man apparently exaggerates the risk involved in his own and minimizes the risks obtaining in the traction business, and accordingly believes that 5 per cent or 6 per cent is sufficient.

Local conditions will determine what is the most effective medium for such publicity. Advertisements in newspapers have been effective. Dodgers, circulars and placards have also been used with varying degrees of success. Much has depended upon the subject matter as well as upon the persistence and attractiveness with which it has been presented.

It is difficult to ascertain whether improved public relations following such efforts have been due to success in handling complaints, the company's policy in other matters such as accident claims, the persistent campaign of education or to other contributing causes. Owing to the difference in the needs and public attitude in each particular case, it would be impossible to expect that a public policy campaign can be outlined which will apply under all conditions. In this respect the "public policy" movement for the traction industry differs from the sales campaigns attempted upon a national scope by other utilities. The problem of unsettled public relations is apparently one of the risks inherent in the traction business which careful local treatment may minimize, but to which no single general plan is applicable.

Part Two

PUBLIC RELATIONS—OPERATING CONDITIONS

IMPROVEMENT OF RELATIONS BETWEEN ELECTRIC RAILWAYS AND EMPLOYEES

By CHARLES W. ELIOT

President Emeritus of Harvard University

THE industrial warfare gets worse, rather than better, in both Europe and the United States; and the events of the last five years tend to show that neither legislatures nor courts are likely to bring about peace and goodwill between capital and labor, or to prevent the industrial losses—some slow and chronic, others sudden and violent—which result from the warfare. Public utility corporations like railroads, electric companies, and gas companies are especially exposed to the losses caused by strikes; because the unions to which the employees of such companies belong are well aware that the general public, being much inconvenienced by strikes, will generally favor the granting of any demands its employees may make on the employing corporation, and will resent the stoppage or impairment of service. The general public distrust of corporations, and the fear of organized labor which elected officials almost universally manifest, contribute to make the position of the employing corporation in all public utilities a difficult one.

Under these conditions, it is for the interest of the employees, the employer, and the public that a method of carrying on the business of public utilities should be devised which will give real content and satisfaction to both employees and employer, and through them to the general public—a method which steadily promotes efficiency in the service, and, therefore, satisfies the public needs, both old and new.

An urban electric railway corporation offers several advantages for instructive experiments on ideal relations between employer and employed. In the first place, the need of such a corporation to secure a method which would bring peace is urgent indeed. Secondly, the business of such a corporation ought to be steadier and more stable than most businesses; because it is comparatively unaffected by the ups and downs of business in general, and by political changes. Again, such a business should always be expanding moderately, and improving through new inventions and new demands. Lastly, the employees are numerous; and, while many of them remain but a few years in the service, many marry and remain long in the same employ without change of residence. An electric railway company has another advantage as a field for experimenting on sound industrial organization, in that it cannot render satisfactory service to the public and make money, unless good discipline is maintained among its employees as regards punctuality, alertness, politeness, and honesty. Now, in a twentieth century democratic society, good discipline in industries is best maintained by interested co-operation between the working force and the managing force, the motives on each side being identical—pecuniary profit and an unembarrassed pursuit of happiness. Of course, the employees of a street railway company are much freer as regards individual initiative and variety in their work than the men and women are who tend machines indoors at a speed determined for them. They are, therefore, particularly good subjects for experiments on industrial relations based on co-operative management and impregnable goodwill.

Anyone who has watched labor legislation and judicial decisions on labor cases during the last five or ten years will have come to the conclusion that it is for the manufacturers, bankers, and merchants of the country to invent and bring into practice the modifications of the wage-system needed to bring industrial peace and success in the pursuit of happiness to both employer and employed.

The experiments on this general subject already tried in France, England, and the United States indicate clearly that a combination of the following modes of action promises to produce the desired result,—(a) co-operative management, (b) profit-sharing, (c) insurance against accidents, (d) sickness and death benefits, and pensions, and (e) good housing.

(a) The value of co-operative management has already been demonstrated in many industries. It is safe and profitable to give elected representatives of the employees a large minority representation on the committee which makes and enforces the rules of a factory, mine, or railroad; provided that the employees have a significant pecuniary interest in the success of the corporation.

(b) The profit-sharing must give promise or hope to every employee of a substantial addition to his wages; and every employee must feel that his own personal return in money is going to depend upon the personal efficiency and fidelity of himself and his co-workers. There are many modes of interesting employees in the success of the employing person, firm, or corporation. Making a dividend to the pay-roll every time that a dividend is made to the shareholders, is one way. Announcing beforehand that a certain percentage of the net profits of the company will be paid in cash once a year, or once in six months, to every employee who has been one year in the service of the company, is another way. Promoting investment by employees in the stock of the employing company, is another; and this may be done in many businesslike ways, as well as in ways which are not businesslike. Thus, whenever the privilege of subscribing to new stock is offered to shareholders, the same privilege may be offered to employees; and the company may agree to take payments for the stock subscribed by employees in weekly or monthly reserves from their wages. No employee should be urged to take stock in the company which employs him, or be induced to do so by the offer of shares at less than the market price; for employees who take stock under such conditions are sure to feel bitterly against the employer, if their investments turn out to be unprofitable, or even to be of fluctuating value. Profit-sharing and co-operative management go well together; but either may be used without the other. Moreover, there are methods of interesting employees in the success of the service an electric railway company renders which are not true profit-sharing,—as is shown, for example, in the plan of the Philadelphia Rapid Transit Company called "co-operative management."*

In that company the pecuniary interest of the employees is in the rise of wages which accompanies automatically an increase in the gross receipts of the company. In the Home University Library of Modern Knowledge, Henry Holt & Company, New York, there is included a little book on "Co-Partnership and Profit-sharing, 1913," which describes a considerable variety of schemes for co-operative management and profit-sharing, both European and American, which have succeeded in practice.

(c) Insurance against accidents, at reasonable rates, and with just co-operation on the part of both employers and employed, is an indispensable part of any scheme for uniting both parties to successful production in one common productive endeavor.

(d) Sickness and death benefits are also indispensable parts of any such scheme. These benefits should be planned and carried into effect by a committee representing both owners or managers and workmen; and this committee should have large discretion in the adjustment of doubtful cases, and of cases of peculiar hardship. Pensions on disability or old age have also a beneficial effect on any industrial corps in which many examples of long continuous service occur, provided the industry itself has proved to be steady and reasonably profitable through a long term of years and, therefore, is likely to be permanent. A pension system works best in government or university employ, or in that of an old, well-managed railroad. It is hardly applicable in novel, precarious, or unproved industries; for it requires a stable corporation of high reputation for honesty and success. From the point of view of the workman, a pension will never be a satisfactory substitute for an equitable share in current earnings. It is most valuable as a means of content and goodwill in occupations which are not conducted for a profit. Just sickness and death benefits are particularly necessary in the service of an electric railway company, because so much depends in that sort of service on punctuality and regularity on the part of all employees.

> **"No plan of co-operative management and profit-sharing will be permanently successful, unless it turns out to be profitable both to employer and to the employee; but it is well-nigh certain that any well-devised plan * * * will prove successful in this sense; for sharing in the profits of the business, and in determining the details of discipline and sanitation, creates a spirit of good-will and contentment which promotes in the highest degree industrial efficiency, and therefore enlarges profits."**
>
> —*Charles W. Eliot.*

(e) An interest on the part of an electric railway company in the housing of its employees may seem at first sight superfluous or sentimental. But, on the contrary, it is a highly practical interest; because family and social health and enjoyments are really essential to the formation and preservation of a large body of employees who are contented and satisfied for good and permanent reasons. It is to be observed, however, that the term "good housing" covers many things beside the house, as, for instance, a garden patch with the house, clean streets, defences against alcoholism and prostitution, a Neighborhood House with reading rooms and an auditorium for concerts, moving pictures, and plays, and playgrounds for open-air sports and folk-dancing,—in short, provision for ample light, fresh air, and all sorts of wholesome games and sports. Every factory village, every garden city, and every neighborhood for cottages of mechanics and operatives, should be so planned as to provide all these advantages. An urban electric railway sends its lines into the city's surrounding suburbs; and the dwellings of the employees may, therefore, be conveniently distributed in large suburban groups among the different divisions of the road. In this respect an electric railway company has some advantage over a factory or mine, which needs to have all its men living within easy reach of the site of the works.

Here it should be observed that it is imprudent for any industrial company to own houses, or carry on stores to be used by its employees. To be sure, the location and conditions of an industry may temporarily be such that the employing company is compelled itself to make these provisions; but such action is always undesirable, because it is apt to lead to suspicions and complaints on the part of the employees, particularly in times of discontent and excitement. Nevertheless, judicious co-operative management will always secure advantages to employees in the purchase of household supplies and uniforms or other clothing.

---

*This plan was introduced by T. E. Mitten, chairman, in 1910-11, and for three years past has proved remarkably successful.

No plan of co-operative management and profit-sharing will be permanently successful, unless it turns out to be profitable both to the employer and to the employee; but it is well-nigh certain that any well-devised plan which contains the various features above mentioned, or most of them, will prove successful in this sense; for sharing in the profits of the business, and in determining the details of discipline and sanitation, creates a spirit of good-will and contentment which promotes in the highest degree industrial efficiency, and therefore enlarges profits.

The problem of an urban electric railway is, in some respects, more difficult than that of an industrial corporation which is not in such immediate and daily contact with the public; but on the other hand a successful solution of the problem is likely to receive from the public prompt and effective support; because the public's interest in the excellence and continuity of the service is strong and lasting. It is worth while for any urban electric railway to win the confidence and approval of its public.

A well-managed street railway can make itself very useful in resisting and relieving the frightful congestion of population which makes a wholesome life impossible in modern cities. On this account the establishment of permanent peace and content in the conduct of that industry has special importance.

CORDIALITY IN PUBLIC RELATIONS

By JOHN A. BEELER

Vice-President and General Manager Denver Tramway Company

MUCH is dependent upon the character of the relations between a public utility company and the public which it serves. The ideal state is where cordiality exists between them. This condition is sometimes very difficult of attainment.

Polite and courteous employees are among the first and most important requirements; especially is this true of a street railway. The trainmen are the personal representatives of the company, the ones who daily meet and deal with the patrons, and the management is judged by its representatives. Rarely, if ever, do you find a body of pleasing and courteous trainmen, but you find the same kind of officers at the head of the company.

> **"Publicity, like charity, should begin at home. Take the employee into your confidence; explain to him the whys and the wherefores. Trust him, and he will not distrust you and will become an invaluable aid."**
>
> —*John A. Beeler.*

A utility company seldom makes any rules or regulations without a justifiable reason for so doing, but frequently such regulations are formulated and enforced without any effort to explain the necessity of these rules even to the employees.

One should never hear an employee remark, "I don't know why, but them's the company's rules." Such an "explanation" sets the patron squarely against the company, once and forever. Publicity, like charity, should begin at home. Take the employee into your confidence; explain to him the whys and the wherefores. Trust him, and he will not distrust you and will become an invaluable aid.

Transportation occupies second place in the world's plan of economics. The railway is a human machine, and the more intensely human, the more efficient. Elbert Hubbard says, "He who eliminates sentiment from his cosmos, takes no interest in the game. Laughter, love, courtesy and friendship are all very tangible assets in making the wheels go round."

Each employee should be made to feel that the proper performance of his work is just as important as that of the head of his department, or of the manager himself.

When any improvement or change in the service is inaugurated, tell the patrons about it. A leaflet circulated in the cars or a brief announcement on a poster in the cars, may be sufficient, but first of all "post" the employees. We in Denver have found our monthly publication, known as the *Bulletin*, very helpful in such matters.

A successful utility should not only be wide awake and progressive, but it must be always on the job and jump at any opportunity to help the community which it serves. Last December, Denver was visited by a snowstorm the like of which the memory of the oldest inhabitant does not recall. Four feet of wet snow fell and was quickly transformed into ice. The snow-fighting equipment was completely helpless; plows and sweepers were marooned in all parts of the city. Not a thoroughfare was open; not a wheel was turning in any of the streets or on any of the steam railway lines leading out of the city. Even the rotary plows of the railways were useless. The people were dazed. After three days of storm, many thousands were suffering for want of coal and provisions. All business and traffic was at a standstill. The city faced a crisis which threatened the existence of many of its inhabitants. Something had to be done and at once!

While the storm was at its height, the Denver Tramway Company had every available man that it could hire at work. Breaking ice with pick and shovel was tedious work, even though several thousand were so engaged. It was an unusual situation and required unusual methods. Great plows, used for breaking virgin prairie sod, were obtained. Horses were requisitioned by digging stables out of 12 ft. drifts. These plows broke the ice up in great chunks, and the hundreds of men piled it up at the sides of the streets. Relays rushed the work along the various lines night and day. Several thousand good citizens, including business and professional men marooned in the suburbs, volunteered their services and set to work clearing the car tracks, and while many of them did not accomplish nearly as much as would a man accustomed to hard work, they at least came to an appreciation of the herculean task that confronted the company.

At the end of the third day of the tie-up an avenue had been opened from the business center into the north and south sections of the city. As the first cars made their progress through the canons of snow and ice, people ran out from their homes and made vociferous demonstrations of approval. The work of opening other lines followed without cessation by night and day.

Work trains were then changed into conveyors of coal and provisions, supplying public institutions, hospitals and private dwellings, wherever necessary to relieve distress.

Even with the addition of all the teams and wagons that could be had, the city was unable to cope with such a volume of snow and made slow progress toward clearing the business section. The Tramway Company placed practically its entire equipment of flat cars and work trains at the disposal of the municipal authorities every night for several weeks and hauled thousands of loads.

In this emergency the company was enabled to confer a benefit upon the community, and the value of a live, human, compact and energetic organization of its kind was apparent to every citizen. Expressions of appreciation poured in from all quarters. Those who formerly had no good word for the company were frank to speak proudly and approvingly of it.

State your case truthfully, in plain language, free from technicalities. The day of the joker, hidden in wordy phraseology, has departed. Substitute sincerity and cultivate cordiality.

INTERURBAN TRANSPORTATION AND THE PUBLIC

By C. D. CASS
General Manager Waterloo, Cedar Falls & Northern Railway Company, Waterloo, Iowa

PRIMARILY the interurban railway was conceived strictly as a mode of passenger transportation between densely-settled centers or between urban and suburban districts. Where the population of the territory served is sufficiently dense, this restricted service has been successful, but where the population is scattered or there is little or no real reason for frequent intercommunication between the points so served, it has been necessary for the managers to seek elsewhere for their profit and future growth.

Personally I believe that many electric interurban lines have little or no right to exist in this restricted form. Most of them were built on common-carrier charters, yet they are operating as limited carriers. If they can do so profitably well and good, but if they cannot it is their own fault if they do not take advantage of the opportunities which are offered to them by the public they serve. In any case the failure profitably to utilize to their fullest capacity all existing railway facilities is an economic waste. I believe greater success could be had in practically every case if the electric interurban railway would become a common carrier in the broadest sense. It should operate on the same plan as a large department store—that is to say, it should sell the public any kind of goods (transportation) it desires to buy.

An interurban railway should also fill a unique position in the field of common carriers. It should not exist simply as a parasite or a competitor of other means of transportation. It should begin by affording suburban and rural districts a form of street railway service both local and limited, and it should handle all classes of package freight. It should provide side tracks and belt lines for switching service, and finally, it should assume its position as a commercial railroad. In other words, it

> **"Where track is laid on which freight cars might be run and no freight cars in fact are run, there is a loss both to the investor in the track and to the person desiring to use this track.**
> **"The more ways in which an electric road serves its public the more dependent the public becomes, and if this dependence is not betrayed, the right kind of public relations is bound to exist."**
>
> —*C. D. Cass.*

should accept, on a profitable basis, the transportation of any class of freight. Of course, this means interchange relations with trunk line railroads which, under the existing conditions, may be had if the electric line has any excuse for existence other than that of a strictly passenger carrying machine.

To maintain a profitable relation with its public means not only to be on friendly terms with the public, but the electric line outside of densely settled territory must compel every dollar of its investment to work to its fullest capacity. Economic waste in anything is more or less apparent to the dullest of us, and it does not take a very keen mind to perceive that where track is laid on which freight cars might be run and no freight cars in fact are run, there is a loss both to the investor in the track and to the person desiring to use this track in the manner suggested. Farmer Jones, Grocer Smith, and Manufacturer Brown can all see this as well as anybody, and it is useless to explain to Jones, Smith or Brown that a curve at Podunk is too sharp for the use of freight cars because they know that the company could give a longer radius to the curve, if necessary, by moving the track.

When one attempts to use friendship as a means of reaching the public's pocketbook he is treading on unreliable ground. On the other hand, when one establishes his reliability as a carrier and meets every transportation need of his patrons, his service is looked upon as a necessity rather than as a luxury. The more classes of service the electric road can offer the more will its public accept these services as a matter of habit. In fact, I believe that each class of traffic will increase as a result of this broad policy, not because the shipper is a friend of the road but because he must have the service and is satisfied with the electric. When he or his employee travel or have anything to ship, force of habit subconsciously enters as much as any other one thing in placing the business.

According to my way of thinking the proper relation between the public and an interurban road should not only be a friendly one, but in its diversified transportation services reliability should be so established as to make it an absolute necessity. If such relations are established on a profitable basis, friendly relations must exist. No patron quibbles with his department store when it charges a slight increase in price for a service over its neighbor, if he has positive assurance that the quality of the service rendered is better. Moreover, no set rule may be recommended to define the way to reach this enviable position. Eternal alertness in regard to the present and future possibilities of any class of transportation is about the only recommendation one can offer. This is exemplified in the beginning of an electric road. Evidently various modes of intercommunication between points furnished the idea for the establishment of a street railway as well as an interurban line. Once established the latter was forced to accept a package freight business, and if the manager was alive to his position he could see the possibilities of profitably relieving the teams of the duty of transporting freight between near terminals.

Following the establishment of a bulk freight haulage, facilities to accommodate the public become a necessity. Unless these facilities are adequately provided at convenient points, the shipper is sure to give his business to the road more favorably situated. The public is patient but heartless, when it comes to its pocketbook. It will give its friends an opportunity to make good, but if in the end the public finds it is at the expense of its own business, the friend is sure to lose its confidence. Reliability and necessity must go hand in hand to produce success, and the more ways one can serve his shipper the better.

In providing station facilities it is necessary to consider future possibilities and not allow local considerations to force their establishment in a location which would be unfavorable to their future growth. To transfer a terminal once established means inconvenience to the public and may mean a loss of business, especially when it is necessary to move to a new location not so easily accessible as the old. Too much importance cannot be attached to the advantage of having an established place of business.

Liberal contracts for industrial tracks and even the provision of sites for industries will redound to the future welfare of any freight-carrying line. A freight belt line around cities served by several trunk line roads and not by one common line of transportation offers an excellent opportunity for increased freight business. Once industries are established on a belt line it becomes a necessity in place of a convenience. Service is what the public is constantly looking for, and it is most certainly going to deal with the company that will furnish it.

As a rule, electric lines hold an enviable position from a service standpoint. This is because the court of last resort, usually, is in charge of a manager who lives in the community his road serves. This insures quick action and at the same time enables the manager to give personal attention to getting new business and holding the old. In this connection, to insure a satisfied patron once you have obtained him, it should be a positive rule that the electric line will be responsible for both the receipt and delivery of freight. In other words, you may please a patron if you deliver his goods at the nearest crossroad, but even if he does relieve you of responsibility after it has been unloaded at the point he designates, theft or damage to the shipment is sure to gain his ill-will. All receipts and delivery of freight should be made through agents and in this way the responsibility is fixed. Passenger traffic does not come under the foregoing category, but much better relations may be maintained if the passenger, too, is provided with a reasonable place to board and alight, along with a simple form of shelter for use in inclement weather.

An unlimited freight service is a valuable publicity agent. One will be surprised upon investigation to find how few of the public know where any railroad runs. If you furnish the public a freight service it must know, and frequently it is called upon to convey its knowledge to others. In other words, the more ways in which an electric road serves its public the more dependent the public becomes, and if this dependence is not betrayed the right kind of public relations is bound to exist.

TRAMWAY FARES IN AMERICA AND EUROPE

By LOUIS BELL

Consulting Engineer, Boston

ONE of the most difficult things for the man on the street to understand is the apparent discrepancy in the tramway fares as he knows them at home and those which are persistently reported from abroad, particularly by the irrepressible advocates of municipal ownership. He pays a nickel, to be sure, with more or less cheerfulness for his ride home, but when he sees a long and specious article in his evening paper explaining that under the beneficent reign of municipal enterprise in Europe the street car fare is 2 cents or thereabouts, at which price the enterprise is financially successful, he inwardly protests and perhaps joins the throng of those who write to the papers about "grasping monopolies," "street car barons" and such like familiar topics. Even the great army of Americans who go abroad do not generally look at the transportation facilities with an educated eye and hence do not grasp the real inwardness of the situation.

Now the broad fact which discloses itself when one begins to study European conditions of transportation is that the costs on the whole run rather high. Railway fares average materially higher than here, taking the second-class car as the equivalent of our ordinary day coach, and the first-class car as a rather poor substitute for our familiar Pullman. When one comes to the tramway proposition the facts are much the same as with the railways, when the comparison is made on the basis of fare per mile.

The three facts which stand out conspicuously to one who uses the foreign tramways with an eye to actual tramway practice are these. First, the general area of a European city, including those suburbs which are regularly associated with it as a part of the same social entity, is very much smaller than the American city of corresponding population. Take, for example, Berlin and Chicago, which are of approximately the same size. Or compare Munich and Boston, or smaller cities of similar character. Not to indulge in dismal statistics, a little reflection convinces the observer at once that the American city is in working area very much the bigger. Its density of population is on the whole something like one-half that of its European equivalent. This is chiefly owing to the fact that, more even than the American, the Continental citizen is a dweller in apartments, the great suburbs filled with separate houses being much less usual in Europe than here. Suburbs there are, and fine ones, in many Continental cities, but they are on the whole less scattered and less distant than those in America. Therefore the average distances traveled by a citizen of a European city, whether on foot or by some vehicle, is a third or a half less, at least, than would be necessary here in a city of similar size. Some particular pairs of cities might be chosen in which the discrepancy would be very much greater. The result is that the number of miles of tramway required adequately to serve a given population, and consequently the investment in fixed plant, is very much less abroad than here, and the density of traffic taken through the whole day is very much greater. Therefore the actual cost of hauling a passenger per mile is greatly reduced below American figures, quite apart from matters like difference in cost of labor.

"The number of miles of tramway required adequately to serve a given population, and consequently the investment in fixed plant, is very much less abroad than here, and the density of traffic taken through the whole day is very much greater. Therefore the actual cost of hauling a passenger per mile is greatly reduced below American figures, quite apart from matters like difference in cost of labor."

—Louis Bell.

> **"Looked at in the sense of the broader civics, the single fare with a long available radius of country which can be reached for 5 cents meets conditions here better than would be possible by the European zone system with its apparently low rate of fare covering a limited area within which comparatively few would from choice wish to live."**
>
> —*Louis Bell.*

Now, second, let us see what the effect of these conditions is on the actual matter of service and fares. As to character of service, the ordinary European tramway car is less comfortable and less expensive than is usual here. Of course, exceptions should here be made with respect to some of the very fine foreign lines of the interurban class. Generally, the distances are short, and so are the cars. A passenger may be supposed to grumble twice as much in riding 4 miles in an uncomfortable car as he would in riding 2 miles, and therefore the Continental passenger puts up a less strenuous kick than would be the case here were the rolling stock similar. The writer still has a miasmatic memory of the discomforts of bumping along on the top of a wheezy compressed-air car in Paris, which must at times have reached the appalling speed of 6 m. p. h. With the advantage of short haul and the relatively cheap rolling stock, to say nothing of cheap labor, it is easy to see why fares could be lowered below American standards without much danger of losing money.

But the European tramway man has a still further string tied to the low-fare proposition. As is quite familiar to most Americans, the European tramways are worked on a zone system, on a basis which may roughly be taken as 2 cents per zone, more or less, according to the place and the currency of the country. One can therefore get a short ride cheaper than here, but a longer one brings the fare nearly up to the American standard, and a run to a point corresponding to the average American suburb brings the fare quite to or beyond our own standards in spite of the low figure for the very short haul. I cannot recall any Continental line on which one can, as is almost universally the case in American cities of any size, pick up a ride of 8 or 10 miles for a nickel or its humble equivalent. There may be a few such exceptional runs, but they correspond to the American instances in which one can with a judicious transfer or two ride 12 or 15 miles for the same modest sum.

The ordinary condition on the foreign line is comparable with that on a certain insignificant interurban line with which the writer is acquainted where the fare for a distance of 7 miles is 25 cents, collected in 5-cent driblets at convenient crossroads along the way. Divide this, as it were, by two or three, and fancy going from the Battery to Central Park with 2 cents collected to Bleecker Street, two more to Madison Square, and a third similar contribution to Forty-second Street, and you have something like the situation when you trundle along through the ordinary foreign city. The payments come in small contributions, but if you ride for any considerable distances they add up very successfully.

Moreover, the zone system has an exasperating way of catching the short-haul traveler just before he gets to his destination, in much the same way as on some of our own lines those who dwell only a short distance beyond the fatal corner where the next nickel is demanded find in that circumstance a perennial cause for irritation. The zone system at first sight seems to be a perfectly fair one in proportioning the payment to the length of ride, and in a densely populated region it works out fairly well. In the loosely built up American city with tramway lines running into the distant suburbs, it would be extremely unpopular if tried again, as it was in the distant days of the "Blue trip slip" of which Mark Twain so feelingly sang.

Finally, the weakest point in the European fare system is that it does not readily lend itself to the conditions of rapid growth which exist in our American towns. To the writer's mind this is the really fatal objection to the zone scheme, by which those who dwell in the periphery of the city pay higher fares than they would under American conditions. It is certainly for the advantage of a city starting, as it were, from the beginning in its growth, to be able to spread out unrestricted, to build up suburbs full of small homes instead of tenement districts, and to give breathing space outside for still further expansion. There is no doubt whatever that the American single-fare system very strongly aids in the establishment of better conditions of life for the working man. Indeed, as a matter of practice, the difference between a 5-cent fare limit and the regions beyond where another nickel is required is keenly felt by those to whom an extra dime a day is a very perceptible fraction of their earnings. Looked at therefore in the sense of the broader civics, the single fare with a long available radius of country which can be reached for 5 cents meets conditions here better than would be possible by the European zone system with its apparently low rate of fare covering a limited area within which comparatively few would from choice wish to live.

In one marked respect the European tramways give the traveler an apparent advantage. He is sure of a seat, such as it is, unless the car happens to be full, in which case he can cool his heels upon the sidewalk and wait for room. One must readily grant that standing in a street car is not altogether comfortable, but when he contemplates the probable language of the average American five o'clock crowd watching a procession of cars —and every one marked "Full"—he calls to mind that delightful old tale of "The Frozen Pirate," and loves his country as it is.

THE ELECTRIC RAILWAY AND THE FARMER

By JOHN R. GRAHAM

President Bangor (Maine) Railway & Electric Company

THE extension of the electric railway into the rural districts has contributed in a greater degree to the advancement of farming in communities remote from markets than any other development of modern times. The electric railway has brought the markets to the farmer's door, making it possible to load his produce on cars without leaving his premises and at the lowest possible expense for handling and haulage. Butter, cream, milk and garden truck can be delivered fresh to the markets each morning within two hours by express service, enabling the farmer to compete successfully with the city gardener. In many cases small sawmills have been built along the line with convenient loading facilities, permitting the farmer to manufacture his lumber and market it where, previous to the coming of the electric railway, this lumber had little value.

Social conditions on the farm have been immensely improved as a result of the electric railway. The farmer's family is no longer isolated from its neighbors and the city, and the problem of how to keep the children on the farm should no longer be a serious one in the communities thus served. Thanks to the electric railway, the farmer can enjoy the advantages of the city, the schools, churches and the theater, while his wife and daughter can take advantage of the bargain day sales in the city stores. With the electric railway has also come the electric light, and village streets once dark and gloomy after sunset are now brightly illuminated. Manual labor on the farm is being replaced with electrically operated devices, and this wonderful development will result in bringing more people back to the farm.

The electric railway is a genuine help to the farmer if its work is carried out along broad lines, without legal restrictions against encouraging the progress of the agriculturist. To aid in developing agriculture along its lines the Bangor Railway & Electric Company has established a demonstration farm of 120 acres on the line running from Bangor to Charlestown. This farm is under the supervision of the University of Maine, to demonstrate the possibilities of intensive production of potatoes, corn, oats and other crops. A strict account is being kept of the amounts of each crop raised and the phosphates used, along with the cost of labor and any other expenses associated with raising this produce. It is hoped to produce 400 bushels of potatoes per acre when the farm is in full operation, compared with the usual 200 bushels which represents the average output of the farmers in the State of Maine.

In order to encourage the raising of potatoes in the Kenduskeag Valley, the Bangor Railway & Electric Company in 1908 reduced the electric freight rates one-half on carload lots of potatoes. In that year sixty-seven carloads were shipped. The business has increased greatly each year, and in 1913 more than 600 carloads were shipped. During the present season it is anticipated that more than 750 carloads will be handled by the line, representing an increase of more than 1100 per cent in six years, and on a line only 25 miles long, with a population of but 2500 people. The freight and express over this line totals more than 50 per cent of that handled on all the other electric railways in Maine. What has been done on this line can be duplicated elsewhere. The opportunities are attractive for the farmer in stock-raising, but to do this successfully there must be good fencing. The farms of Maine present a decided and unfavorable contrast to those of Canada in this particular. Stock raising will help to keep the young men on the farm, and besides improving the fertility of the land it will stimulate additional traffic on the electric railways running through such communities. I would like to buy 500 head of yearling Hereford cattle in the West and distribute them to farmers along the lines of the Bangor company, but at present we have no fences good enough to hold them.

> **"Social conditions on the farm have been immensely improved as a result of the electric railway."**
> **"As a device for taking up what may be called economic lost motion between the city and the country, the electric railway * * * has no superior."**
> —*John R. Graham.*

The prosperity of public utilities closely affects the communities served by them. Farmers sometimes do not appreciate any more than other people the benefits of a centralized management of public utilities. These may be brought home to them in a practical and common-sense way, without undue self-praise. In 1902, for example, the various properties centering at Bangor were five or six in number. Their bonds were selling at about 50 per cent below par and their stocks were at the lowest ebb financially. None of these corporations paid dividends. All have now been consolidated into the Bangor Railway & Electric Company and are in a prosperous condition through economical and financial operation under centralized management. Where the Maine savings banks and investors used to buy out-state securities, they are now gradually absorbing the stock of our public service corporations. One of the trust companies in Bangor has sold securities to the amount of more than $3,000,-

000 to investors in our locality. There is a good demand for Maine public utility securities, and there are great possibilities in water-power development, which should be encouraged by low taxes and liberal laws. The different companies in which I am interested in Maine are to-day using more than 30,000 hp hydroelectrically generated, whereas ten years ago there were only 3000 hp of hydroelectric development in these systems. All of this benefits the farmer as well as the city resident in our territory, and through broadened services, possible production of fertilizer by the utilization of atmospheric nitrogen, application of power from the railway and lighting transmission lines to farming machinery, electric cooking and other developments, the outlook for the future is very attractive. As a device for taking up what might be called economic lost motion between the city and the country, the electric railway managed along the lines above outlined has no superior.

WINNING THE CONFIDENCE OF THE PUBLIC

By R. M. SEARLE

Vice-President New York State Railways, Rochester Lines

At times the public's idea of how a railway should be operated may seem somewhat strange. Indeed, one of the most complimentary remarks about our management that ever came to my notice had nothing at all to do with railroad operation, although it was made by a highly intelligent citizen of Rochester. This man had purchased a black lynx muff on Easter Sunday eve for his wife to carry the next day. About nine o'clock Saturday night he telephoned to the home of the vice-president of the railway that his wife had left the muff on the car. He asked whether it had been found, and if so, how it could be obtained in time for church the next morning. The man was told that he would be notified within a few minutes whether or not the muff had been turned in and how he could get it. As it happened, the conductor of the car had telephoned at the end of the line to the despatcher, saying that he had the muff. In consequence, the night inspector's automobile was immediately despatched for the muff and within fifteen minutes the muff was in the owner's hands. The point of this is that the owner's husband telephoned immediately to the vice-president of the railway, and, in thanking him, said that that was the way to run a railroad.

This citizen's idea of railroading may have been vague, but his outlook naturally did not go beyond that which he could understand. Indeed, most of our troubles have been due to misunderstanding on the part of the public. My experience dictates that if the public is unfair it is so because it is kept in ignorance. Every day a representative of each of five newspapers visits our office. These men have the entrée unannounced to every officer's room, may listen to all manner of conversation that is carried on at the time, and receive typewritten digests of anything of unusual interest that has happened during the day. Without fail, every day in the year, parts of reports that I receive are published as news.

The railway business is an honest one—there is no reason for secrecy, and the better informed these able newspaper men are, the more they will appreciate the problem of operating the road to the satisfaction of the public, and the more their sympathies are with us in any unusual difficulties. I never yet have had a conference in our office from which I felt that there was any reason for excluding anybody. To illustrate: frequently a railway manager has felt chagrined because some paper has said that he operated a rotten road, just as it is probably true that some morning he has taken up a paper in which there was no news and has said that it was a rotten paper. Does this same manager realize that the public is interested in every important feature of railway operation, in construction or reconstruction, in passenger problems, in delays or accidents? Does he realize that everything in connection with his road, so far as the public is concerned, is news and that, if he does not zealously contribute his portion of the news in which the public is interested, he cannot expect others to contribute news in which he himself is interested?

I have frequently been asked by newspaper representatives if unjust criticisms do not "get my goat," and I have said "No!" The criticism that "gets my goat" is the just one—the one that criticises the management about things that could have been and should have been prevented, or things that could have been avoided had one of the officers of the company taken time enough to make the matter plain to the newspaper men.

The most dangerous thing that street railway corporations do to-day is to answer criticisms of passengers or others by correspondence. No man on earth can make a criticism by correspondence and tell the same story that is conveyed by the personal mannerisms which appear to an investigator in personal contact with the complainant. If a person complains by letter he should be interviewed by a representative of the company with authority to adjust the complaint, and after it is all cleaned up he should again be seen personally and have it made plain to him that the rights which he has, and which the company is bound to respect, have been respected. The point in this is that after three or four letters have passed between a complainant and the company's representative all the original complaint is lost track of, and it becomes a personal quarrel between the two, resulting in nothing more or less than a combat of literary "cussing."

I have frequently analyzed a condition where a man has complained of the treatment he has received from an officer of the company, and by running it down I find that the complaint is about what has been said in a letter and not what he wrote about originally. If the men had met together, face to face, or over the lunch table, they would have thoroughly understood each others' problems, and if a dispute had developed it would probably have been on the golf links.

Another policy of our company is that any employee can talk for publication if he tells the truth. If he is asked a question and does not know the answer he is encouraged to say that he will put the inquirer in touch with the man who does know the answer.

We have found that much criticism and bitter feeling can be avoided if, during construction, signs are placed at crossovers reading, "Dangerous construction going on here, do not cross." When this is done, the burden of thoughtlessness is placed upon the one who then attempts to cross. If temporary work is going on and the pavement is put back in a temporary manner, we put up signs reading, "This work is temporary. New pavement will be placed in position and street restored in original condition in September." The object of this is to let the whole neighborhood know that the company has no idea of leaving the pavement permanently in a "sloppy" condition. So long as everyone does know it there is no neighborhood gossip or criticism derogatory to the company, no appeal to the alderman, no rush to the engineer's office, and no bitter newspaper articles that the company is trying to "slip one over" on the public.

In a case that may be cited as an example, where a mile of new double track was being laid, a mass meeting was held at a citizen's home to protest against the blowing of dust created by the cars into the houses during the hot weather when the windows and doors were open. It was suggested that a petition signed by all the residents on the street should be sent to the Board of Aldermen to compel the company to sprinkle the streets. However, the citizen in whose home this meeting was held, having a knowledge of the company's attitude in these matters, stated publicly that if they would delegate him to see the general manager he was sure that the railroad would gladly eliminate the nuisance if the responsibility was up to it. He visited the railroad office and was told that either the railroad or the contractor who was paving the street was responsible for sprinkling the street, but that, in any event, the street railway would handle the matter and have the streets sprinkled until construction was completed. It was found later that the responsibility actually did rest on the street railway so that it continued to keep the street sprinkled and thus abated the nuisance. The result of this was that, subsequently, whenever the citizens had any criticism to make, the street railway management was called into conference and a most pleasant condition obtained during the entire reconstruction.

"I never yet have had a conference in our office from which I felt that there was any reason for excluding anybody."
"Any employee can talk for publication if he tells the truth."
"The public is simply an aggregate of individuals. If the companies treat the public in the same way that one individual would treat another whose respect he wished to gain or keep, the difficulties of the public service corporations will largely disappear."
—*R. M. Searle.*

As another illustration it might be said that there were two factions on the street, one wanting asphalt and the other creosoted wood-block. The latter was contracted for, and the asphalt faction formed vigilance committees to follow up the wood-block pavement. One night they made a discovery that much of the wood block was spaced from ¾ in. to 1 in. apart, and the railroad management was notified that the citizens felt the contractor was putting something across on the railroad company's job. Investigation showed that this work was done during the late afternoon and had not been permanently spaced for acceptance. Instead of either telling the committee that this was bad work, or else ignoring the complaint, the railroad management arranged a meeting with the committee, the contractor, the city inspector and the railroad officials during which it was made plain to all concerned that there was no intent on the part of the contractor to do anything but good work. This had the effect of stopping all criticism on construction in this street. The point here is that instead of making a "goat" of the contractor and putting it up to the city engineer to satisfy the asphalt-paving faction and the other citizens generally, the railroad management obtained all the credit for bringing them together. Everyone was left with a friendly feeling for each other, and the city engineer was relieved of a disagreeable job.

During the course of reconstruction of track in the business center of our city in front of the Osborn Hotel a Knights Templar convention committee from Toronto said that they would bring to this hotel two commanderies of 125 men each, providing the street in front of the hotel was repaired so that they could form for parade. The manager of the hotel telephoned to the railway that he could get this business on condition that the street was placed in good shape. He was promptly advised by the railroad management that the attitude of the railroad to the citizens of Rochester was in every way one of co-operation, that the railway wanted them to get all the business they could because the railway was commercially selfish and its success was dependent upon that of the hotel. The railway promised that if the construction was delayed so that the street could not be permanently repaired in front of the hotel, it would be planked over during the three days of the Knights Templar convention, and stated that the proper course was, by all means, to sign up with the Toronto commanderies. As a matter of fact, it was found by the construction department that it could have the job permanently closed on time without any additional expense, showing that there is always a little more you can do if your liver is in order.

An example of the direct value of possessing the confidence of the public was shown recently in the application on our interurban line, the Rochester & Sodus Bay Railway, of an increase in fare. This line had been operating at a loss for some time, and it was imperative, if the company was to continue to give the service which the community demanded, that increased rates should be charged. The subject was taken up with all the citizens within reach of the line, which is 40 miles long. The company placed the matter before them frankly and asked for their co-operation. This was given in practically every case. A petition was submitted to the Public Service Commission and received its indorsement, and new rates went into effect. This example is cited because, in the opinion of the writer, the public is willing to grant anything that is fair when it understands the situation. The public is simply an aggregate of individuals. If the companies treat the public in the same way that one individual would treat another whose respect he wished to gain or keep, the difficulties of the public service corporations will largely disappear.

ASPECTS OF RUSH-HOUR SERVICE

By E. C. FOSTER

President Manchester (N. H.) Traction, Light & Power Company

THE opinion that rush-hour traffic is handled at a large profit on the modern city street railway system is held by many otherwise well-informed persons. Accustomed as they are in daily affairs to the idea that the larger the gross volume of business the greater the profit upon the cost of handling it, such people fail to take proper account of the time element as a factor in economical transportation. Out of this mistaken view, which looks upon the rush-hour patronage of an electric railway as a veritable harvest of divisible net returns, have come demands for reduced rate service which are entirely unjustified by the conditions.

> **"The idea that rush-hour profits are relatively high is a fallacy which cannot too soon be brought home to active champions of cut-rate transportation and to commissions sitting upon petitions for such reductions."**
>
> —*E. C. Foster.*

In order to meet the traffic demands compressed by the public into the narrow limits of a few hours in the early morning or forenoon and the late afternoon, an operating company must meet vastly increased overhead expenses and heavy additional operating costs as compared with the outlay which would be required to handle a reasonably uniform amount of business distributed throughout the whole day. These extra heavy and temporarily sustained demands, picturesquely called "load peaks" by engineers, are not only very difficult to surmount with a prompt and safe service, but they impose serious financial burdens upon the railway system. It is desirable that the trained railway man, who understands this situation thoroughly in his own mind, even if he does not take the trouble to put it into words, shall be prepared to make it equally clear to the public. By so doing he may more effectively resist an invasion of his revenue in the form of popular agitation for cut-rate transportation for certain classes of patrons in the rush-hour period. Fair-minded men are not likely to demand such concessions, once they realize their economic injustice to the company and to other classes of patrons enjoying no discrimination in fares or transfer privileges.

During the rush-hour period on almost any representative street railway the traffic demands require the company to run upon its lines at least double, and sometimes three or four times, the number of cars required to serve the public at other parts of the day. Here is an investment in rolling stock which stands idle more than two-thirds of the time; it involves an additional outlay of real money for extra copper in feeders, poles and line fittings, generating station capacity, shop facilities and carhouse space. There is no escape from the fixed charges which must be paid upon this extra equipment required to move the traffic as best it may under the trying conditions of the rush hours. These charges are not ordinarily apprehended by the public as it sees heavily loaded cars moving along the streets morning and night; they are not apparent to the casual passenger, but they are none the less real.

On the operating side rush-hour business exacts a heavy toll. If a company could put a motorman and a conductor on each extra car and pay them at the regular rate for the exact time spent on the platform, the cost would obviously be much less than at present. It cannot do this, however, for American wages and standards of living require a certain minimum compensation which almost always calls for an outlay on the part of the company in excess of the value of the rush-hour platform service performed, so that the per diem earnings of the employee on the extra list shall attain a minimum above that which would be received for net platform labor on a very limited number of rush-hour trips. Therefore, although a company appears to be reaping a harvest from its crowded cars and is actually carrying more passengers per car-crew than in the normal hours of the day, it is obliged to meet a very much larger wage expense the day through than would be the case if its traffic were fairly uniform. It must also carry along a force competent to handle this short-lived peak business, although, during many hours, that force must be laid off from active service.

Rush-hour travel probably does not seriously increase the so-called manufacturing cost of power production per kilowatt-hour if the generating station is of a flexible design and of ample capacity for the service; but on many systems where it is necessary to start up an auxiliary steam plant to tide the company over the peaks, the unit cost of power rises considerably and, on every system subjected to rush-hour peaks one may expect to find that the total power cost per unit of energy developed is greater, when fixed charges are considered, than it would be if the company could run its cars fairly uniformly and without the inordinate demands for power which force the management to spend large sums on equipment capable of carrying the plant through the rush periods.

Without elaborating further on the increasing costs due to rush-hour service, it is apparent that reduced rates at such a time tend to make conditions still harder to meet. Increased patronage of the extra and regular cars inevitably congests the tracks and slows down the schedules, necessitating the operation of a larger number of cars on the ends of lines, known on large systems as "set-backs," the effect on small systems being to delay travel, with increased demands upon the power station and distributing system and less satisfactory service to patrons. Logically, if any reductions are to be made in fares they should be such as to encourage riding in the normal hours of the day, and efforts spent to develop this class of travel and to reduce the margin between mid-day and rush-hour service are most commendable, although the writer believes that a "one-price" system, with everybody on a par, should always be the policy of the city company. Surely the workingman is no more entitled to a reduced rate than is the working girl who travels an hour or two later, and the fairest plan is to treat everyone alike. The idea that rush-hour profits are relatively high is a fallacy which cannot too soon be brought home to active champions of cut-rate transportation and to commissions sitting upon petitions for such reductions.

ENGINEERS AND ACCOUNTANTS AS FACTORS IN SECURING BETTER PUBLIC RELATIONS

By DUGALD C. JACKSON
Professor of Electrical Engineering Massachusetts Institute of Technology

THERE are certain important differences between the businesses of public service companies and the businesses with which the average citizen is familiar. These differences are fundamental, but unfamiliarity with them has not uncommonly given rise to misapprehension, antagonism and criticism toward the public service companies by the general public even in places where the service rendered is good and of reasonable price. The average man has no natural measure of comparison except that springing from his own experience, and he instinctively judges the business profits of a public service company by the ratios of profits to investments in the businesses with which he is familiar, whether these businesses are large or small. When informed that this experience is not borne out by the book accounts of a public service company, he may retreat to the cover of a belief that the investment accounts shown in the books of the company in that case do not represent expenditures of cash and legitimate effort but are fictitious.

The fact that the interest on the investment in a public service property requires a much larger part of the total revenue than mercantile experience might lead one to believe makes one very important difference between the business of an electric utility company and the ordinary businesses

"The average man may, as a matter of his own business experience, honestly believe that he is being unfairly treated by an electric utility company when such may be far from the fact, and the only way to convince him and his associates, composing the public, of the truth in the matter is to present the facts in such a manner that the individuals may measure them by means within the reasonable scope of their own experience."

—*Dugald C. Jackson.*

with which citizens are familiar, and this difference is not now fully understood. Merchants, manufacturers and other business men expect to turn over their capital at least once in every year, and it is not unusual in mercantile businesses to turn it over several times a year. This reduces the proportion with which the interest on investment enters the prices that must be charged to customers, because the annual interest is spread over sales aggregating from one to many times the amount of the capital invested. If the value of product made and sold by a manufacturer in a year is twice the amount of the invested capital, it is obvious that 10 per cent profit earned on the product above all manufacturing costs and charges means 20 per cent profit on capital.

On the other hand, while, broadly speaking, the economic laws under which the public service companies operate are the same as those applying to mercantile and manufacturing businesses, most public service companies are situated under conditions quite the contrary in respect to ratio of investment to the annual revenue from those that relate to the processes of general business and manufacturing. Instead of earning gross annual revenue equal to or exceeding the capital investment, an electric railway company must ordinarily put out and expend a sum of money in establishing its plant and business which is not less than four or five times, and in some times as much as six or eight times, the gross annual revenue that it may expect to receive. This at once multiplies the proportion of the revenue which must go to the investors in case a reasonable return is paid on the investment. For instance, if the annual gross revenue of an electric railway is one-fifth as large as the cash investment in the business, then 7 per cent on the investment amounts to as much as 35 per cent of the revenue. It is obvious that the ratio is here exactly the contrary of that arising under the conditions which exist in most of the branches of business and manufacturing.

This being the case, the average man may, as a matter of his own business experience, honestly believe that he is being unfairly treated by an electric utility company when such may be far from the fact, and the only way to convince him and his associates, composing the public, of the truth in the matter is to present the facts in such a manner that the individuals may measure them by means within the reasonable scope of their own experience. It seems to me that the public in general holds the correct belief that the public service companies are under the same economic laws as general business, and that this very belief, correct though it is, causes a break between the public and the companies which is due in large measure to the failure of the public to recognize that the electric utilities usually have, as already said, from $4 to $6 of actual money invested in property which is rooted to the earth, for every dollar per annum of gross receipts which goes into their treasuries from the public, and that this is equally true whether the utilities are owned by private corporations or by municipalities. Failing to recognize this condition, the public comes to the belief that it is being treated to robbery when it observes that from one-fifth to one-third of the annual gross receipts are paid to the stockholders in dividends or as interest on borrowed money.

It is to be observed that not only is the average citizen who comes in contact with the public utilities ignorant of the conditions above mentioned, but this is also true of the great part of the employees of the utility companies. These employees, as a rule, are better acquainted with the business processes of their brothers or their brothers-in-law and their other acquaintances who are shopkeepers or connected with mercantile or manufacturing concerns than with the business processes of their employers; and it is their honestly founded belief, even though they may have a loyal regard for the honesty of the officers of the employer companies, that the business processes of such a company do not differ except in magnitude from the usual processes of which they have knowledge through their shopkeeping relatives and acquaintances. The public seems to be fairly liberal in its views of what makes a reasonable return to enterprise and money which is invested in general business. A community is ordinarily rather proud of a banker who has earned a competency or even become wealthy as the result of the success of his business, provided he has been fair-minded and reasonable in his treatment of his customers. The same is eminently true of successful merchants. The public knows, however, that the merchant, and likewise the banker, makes on the average relatively small profit off of each dollar which passes annually through his hands, and the contrast between these lines of business which are well known to the public on account of its own participation therein and the conditions of investment which must be followed by the electric utilities occasion no little friction on account of the insufficient information of the public.

Twenty years ago it was quite generally accepted that the value of public service properties could be estimated from the earning power afforded by rates for service which were founded on expediency, and out of that circumstance arose conditions which increased the misunderstandings thus far described, but these misunderstandings ought to disappear as a consequence of the closer analysis of to-day, which argues that the receipts of public service companies should not be matters solely of expediency but should bear relation to cost of serving, including the return on the property required for giving the service as a part of the cost.

It is usually not practicable in this relatively changing industry of the electric utilities to rely on the records and books of account of long-established companies to give itemized facts in regard to the extent and first cost of the plant. As a rule these data are not in sufficient detail to afford an adequate foundation for a determination of the original cost of the existing plant, which might set at rest some of the misunderstandings referred to. The older companies have not uncommonly gone through processes of evolution in bookkeeping contemporaneously with the evolution of their business, and earlier books commonly exhibit little more information than the extent of receipts and expenditures, with the latter perhaps divided between operating and plant accounts, but with no reliable separation between the cost of new plant and of renewals. That is to say, the art of bookkeeping itself, when viewed from the modern standpoint of a complete record of the company's physical as well as financial affairs, is of rather recent development. Also, many properties are the result of consolidation, sometimes accomplished through foreclosure sales, and the earlier records may be lost. It is, therefore, necessary to formulate principles which define the relations of the utility companies to the public, and adjust the relations by negotiations so as to establish right conditions. Limitations of space, however, do not admit of the complete presentation of such principles in this article.

One of these principles must relate to certain special conditions, licenses or rights, which are conferred on a public service company, which include the franchise to use the public streets for a particular service and in some instances to invoke the State's right of eminent domain, and upon this franchise question has been founded much misapprehension and error in the minds of the general public as well as the public utility managers, which has been increased by the utterances of some economists. The misinformed and unthinking assume that the grant of a franchise to use the streets for tracks to guide cars, poles and wires to convey electric current for lighting, power or communications, or pipes for water or gas is equivalent to the grant of a valuable concession to enable private parties to make extraordinary profits, but this is a misapprehension. The grant in most cases is intended as an authorization by the public for a utility company to perform in a particular way service for which the public has a need. The word "concession," in other words, is not a correct appellation. The grant is made by a corporation comprising all of the public concerned (i. e., a state or municipal corporation) to a corporation (i. e., an incorporated limited-liability company) comprising such part of the public as are willing and able to risk money in the enterprise. Such an authorization is nowadays usually of a nature analogous to a license such as is given to various other kinds of business, with some added limitations, and it should be for the mutual advantage of the licensee and the licensor. There are differences, however, between the business of a public utility company, like an electric railway, and the usual trading businesses, as I have already pointed out. Certain of these may be expressed by the fact that the capital required for the average trading business is usually small and within the reach of many individuals who may care to take up such businesses. For this reason competition will be apt to arise in such businesses and will tend to bring the prices for the service to reasonable figures and the quality of the service to satisfactory character. The fact that this possibility that competition will take place under the conditions described also reassures the public in respect to the reasonableness and desirableness of the treatment accorded. On the other hand, the capital required by a public service company is commonly large, and competitive ventures are not so likely to occur, nor is it so desirable to have them occur.

"The misinformed and unthinking assume that the grant of a franchise to use the streets for tracks to guide cars, poles and wires to convey electric current for lighting, power or communications, or pipes for water or gas is equivalent to the grant of a valuable concession to enable private parties to make extraordinary profits, but this is a misapprehension. The grant in most cases is intended as an authorization by the public for a utility company to perform in a particular way service for which the public has a need. The word 'concession,' in other words, is not a correct appellation."

—*Dugald C. Jackson.*

These same differences may be expressed by the further fact that competition does not introduce any inconvenience in the relations between customer and purveyor in ordinary business, nor is inordinately expensive duplication of capital caused by competition where the fixed capital is small, as in ordinary businesses. But inconvenience to the customers is often caused where general competition of like public service companies occurs, as, for instance, when two street railways go into the same territory and do not give interchange transfers,

> **"It is of importance that engineering statistics be made more a part of the permanent records of the companies, and that the record keeping of the companies become a joint structure of accountants' financial statistics and engineers' physical and production statistics. This accomplished, the facts of legitimate electric railway investment and management are likely to fall out of their present sphere of public controversy."**
>
> —*Dugald C. Jackson.*

and duplication of capital is likely to be large and economically indefensible in the case where such companies lay separate tracks on the same streets.

Another principle should plainly assert that the bookkeeping for a public utility should scrupulously distinguish between capital expenditures and operating expenditures (including within the latter such expenditures for renewals of plant as are required to be made as the plant depreciates so that economical and good service may be maintained).

It is obvious that, excepting the cost of extensions and enlargements proper to be provided for as additions to investments, the legitimate expenses of an electric railway company must ordinarily be provided for out of the revenue obtained from the charges which are made for hauling passengers and freight or performing associated services, and the rates should raise only enough revenue on the average to meet these expenses, provided the word "expenses" is used comprehensively so as to include return on the investment. A reasonable amount of standing surplus of the nature of a reserve is needed as a reservoir to maintain a parity of conditions from year to year, and if this has been drawn upon it must be replenished as earnings warrant. The item called return on the investment is sometimes referred to as "interest" and sometimes as "interest and profit." In the latter phrasing, it may be understood that the interest referred to must be taken at current rates for well secured investments, and that any additional return required to support the solvency of legitimate projects may be called the commercial or contingent profit which is necessary to attract people to invest money in a business with many risks of failure. The courts hold that a public utility must be allowed to earn a fair return on its investment provided this can be done with prices for service that are, commercially speaking, reasonable to the consumers; but if the business cannot be made to pay returns to the stockholders with such rates, then the loss is the stockholders'. This risk the stockholders must bear in addition to the risks always incident to commercial enterprises which are embarked in a growing and changing art.

If the stability of the company's properties and the rates by which the revenue is raised are to be put upon a rational basis to which the confidence of the public will be extended, there must be some better reason for the differences between the charges for service than only the judgment of company officials, however able and experienced those officials may be. To improve upon this condition it is necessary to obtain intimate statistical records of the character of the service required to meet the needs of the customers, and, in a general way, of the plant investment required to provide that service, the effect of providing the service on the wear of plant, the expenses of operation associated with the service, and other like information that electric utility companies have not generally been in the habit of gathering or recording. In those instances where the statistics have been gathered and recorded, it has as a rule been done by a statistical department unassociated with the regular accounting department. The inefficiency of this process seems manifest and leads to the suggestion that the plant statistics, the money statistics and the traffic statistics should be brought into association.

Many utility companies have heretofore been satisfied to hold their accounting as a species of auditing, capable of showing what dividends the company can pay after leaving some surplus as the result of any year of operation, and they have failed to erect their accounting into a statistical structure which will show correctly the relations of their business to their property and the profits which the business brings. But to bring about the needed confidence between the public and the companies without friction and shock, it is of importance that engineering statistics be made more a part of the permanent records of the companies, and that the record keeping of the companies become a joint structure of accountants' financial statistics and engineers' physical and production statistics. This accomplished, the facts of legitimate electric railway investment and management are likely to fall out of their present sphere of public controversy. Public studies of the elements which are comprised in the cost of hauling passengers, such as those now in progress at the Massachusetts Institute of Technology, will tend to the same end.

Part Three

PUBLIC RELATIONS—PUBLIC SERVICE REGULATION

QUALIFICATIONS OF A PUBLIC SERVICE COMMISSIONER

By ALEXANDER C. HUMPHREYS

President Stevens Institute of Technology

WHEN we pause to consider the tremendous authority given to, and hence the tremendous responsibility carried by, the members of our public service commissions, this question of qualifications is found to be one of vital importance to all the interests involved—which means the people as a whole. Public service commissions are invested with a scope of authority which is not only out of harmony with the traditions of our form of government but is in actual conflict therewith. According to our form of government, no one man or body of men should have authority in the three functions of government—legislative, executive, and judicial. Reasonable and effective regulation of public utilities does not require any such extreme measures. Until recently such a consolidation of authority would not have been even considered in this country. But this is the day of radical changes, made recklessly, in the face of the teachings of experience.

In view, then, of the extraordinary power wielded by these men, and the fact that they are acting outside of the traditions of our form of government, the chief qualification for membership in one of these commissions should be an intense, overmastering desire and purpose to hold even the scales of justice. Furthermore, the commissioners should be men imbued in no ordinary degree with the saving quality of common-sense coupled with self-restraint. They should be so qualified temperamentally that they will hold fast to the fundamentals of truth. No matter what may be the other requirements in the line of specialization, the qualifications named should be found in each and every commissioner in these United States. This means the selection of men of unusual balance and strength of character. But a general compliance with these specifications can hardly be expected where "politics," in the form of rewards for services rendered, plays such an important part in municipal, state, and national governments.

It has been suggested repeatedly that to secure men of sufficient character and ability for these positions, liberal salaries should be paid. Undoubtedly, the highest salaries as yet paid in the United States are none too high as compensation for the service required, and much higher salaries could be earned by the right men. But high salaries are by no means a cure-all. In fact, the higher the salaries the more determinedly and persistently will these positions be sought by party hacks, and the more highly prized will they be by the appointing powers as a means for paying political debts. Those of us who have had personal experience with the commissions know that many of the commissioners are over-paid, while, no doubt, there are a few who are inadequately compensated for the work they are doing.

It must be borne in mind that these commissioners have to pass judgment on many questions for which no one man is qualified to render a final opinion. As most of the questions, or at least a large majority of them, have to do with industrial and engineering questions, place should be found on every board for at least one broadly-equipped engineer. It by no means follows, however, that because a man is an engineer he is qualified to sit on one of these boards. But the theoretical training and practical experience of the engineering profession should be fully represented. An engineer so chosen should have to the full the qualifications first named, and he should particularly have had experience, not only in construction of engineering works but in the operation of industrial properties, preferably public service properties. In other words, he should be qualified as designer, constructor, and administrator of such properties. Also, he should have full command of the principles, at least, of accountancy, and should be a student of the subject of "depreciation," so-called. Notwithstanding the fact that many of the questions which our public service commissions are called upon to determine require for their solution the highest engineering training and experience, it is the exception when an engineer is appointed as a commissioner.

"Notwithstanding the fact that many of the questions which our public service commissions are called upon to determine require for their solution the highest engineering training and experience, it is the exception when an engineer is appointd as a commissioner."

—*Alexander C. Humphreys.*

In this connection, I may well quote from an address delivered last spring before the American

> **"Our public service commissions should be composed of common-sense men, broadly trained, broad-minded, fair, and competent as investigators (an unusual qualification); and in each commission there should be men fully qualified in the theory and practice of the professions of engineering, law, business, finance and accountancy."**
>
> —*Alexander C. Humphreys.*

Railway Engineering Association in Chicago by Judge C. A. Prouty, formerly chairman of the Interstate Commerce Commission, and now director of valuation of railroads:

"In the last fifteen years the price of every article of universal and general consumption, with one exception, has advanced, and that exception is transportation by rail. If transportation by rail alone has not advanced it is because railway engineers, by providing a better way and a better machine to operate upon that way, have rendered it possible to make economies which have offset the increased cost of labor and of supplies. The United States is about to enter upon a work of very great consequence, and the railway engineers are identified with that work. The problem is not altogether an engineering problem. It smacks of economics and of law and of politics, but the business of ascertaining and collecting a great part of the information is peculiarly a task of the engineer's, and I am not certain but the engineer may finally turn out to be the best qualified of all to consider the other problems.

"Now when I began this work, I was told that an engineer could measure and figure with accuracy, but that he was not competent to discuss the intricate problems presented by the valuation of our railroads, and that we must be very careful not to let him undertake to discuss them. I am fast coming to the conclusion that he may be better qualified than anybody else to discuss them. I have been a lawyer all my life and I believe that my profession is the greatest of all professions, but I am obliged to admit, and I think I have said this before, that the training of a lawyer does not fit him for the discussion of questions of this kind. A lawyer by his training is a partisan. If you go back to the law school you will find that he is given a certain thing to affirm, and it is his business to make out that case. In life he has one side of a controversy, and he must establish that his side is right.

"The engineer is entirely different. He begins in school with mathematics. There is but one answer to a problem in mathematics. It may be hard work to find it, but there never can be two answers. When the engineer gets into life it is still his business to find the fact, and just according as he can find the fact and be certain of the fact, he grows. If an engineer designs a bridge, and that bridge falls, his reputation falls with it. He cannot call in the undertaker and bury his blunder, as the doctor does. He can't charge it to the stupidity of a court, as the lawyer does. He must assume the burden of it himself. So I say that the very training of the engineer fits him for that precise kind of thinking which is essential in the working out of these new problems where absolute impartiality is necessary."

The business and financial interests should also be fully represented on these boards. It is coming more and more to be the practice for these commissions to control the financing of public-service corporations. It is ridiculous to suppose that a man who has studied finance only in the economics department of a college or university is thereby qualified to act intelligently and fairly on great financial questions. If a man thus prepared has later had the necessary broad practical experience, then the college training may be of definite value.

The profession of law should also be represented, but emphatically not to the extent at present found to be the case. In other words, the lawyer has his place on these commissions, and a most important place; but it is distinctly a misfortune that the lawyer and the theoretical economist are, as at present, practically dominating this most important branch of our industrial life. The lawyer is no more qualified for a position on one of these boards because he is a lawyer than is the engineer because he is an engineer. A lawyer may be most competent as an advocate, but he may be totally unfitted to act as legislator, administrator, and judge. As to the inexperienced college economist—words fail.

The Minnesota rate case indicates that even the august United States Supreme Court might be improved by some of this non-legal leaven. To refer to one point only, the valuation of lands, which, according to the court, are to be inventoried at a "fair average market value of similar land in the vicinity, without additions by the use of multipliers or otherwise to cover hypothetical outlays." These are hardly "hypothetical" outlays, when the evidence is apparently indisputable that a Minnesota railroad, recently built, paid from one and three-quarters to three times as much as the price of adjoining lands.

It has been argued that the engineer is not qualified to act as a commissioner by reason of his lack of broad experience. My answer has already been indicated. He is not qualified simply because he is a competent constructing, consulting, or administrative engineer. He must have had the broad experience suggested by the combination of these three branches. And there are many such to be found; although I confess it may be hard to find many willing to make the necessary sacrifices involved in the acceptance of one of these political positions.

Again, it has been argued that the engineering profession might better be represented by membership on the staff and by competent outside specialists, these last to be consulted as specific needs develop. The idea here is that no engineer can keep up with the details of all branches of engineering, and so it is better to depend upon many specialists, each in his particular field; and, further, that if an engineer of reputation is on the board, the tendency will be for the other members of the board, not engineers, to be dominated by the engineer member on all engineering questions. My answer to this is that I have stipulated for a broadly-trained engineer. Such a man, of judicial and open mind, will recognize his limitations as to the details of specialization and will avail himself of the opinions of specialists; but he will, if he is the kind of engineer I have specified, be better qualified to pass judgment on the opinions of these specialists than could be a man of any other profession. In other words, he is qualified in the fundamentals of engineering science and practice. This argument against the engineer might just as logically be urged against the lawyer, for there are specializations in the law as there are in engineering.

To obtain in sufficient numbers such men as I have thus roughly described unquestionably will call for the exercise and development of patriotism. Men who, by preliminary training and, later, by sufficient practice in the school of experience, can meet the specifications I have outlined, can be found in ample numbers. But generally these men could not be drawn into public service, where the monetary compensations are limited and the tenure in office is subject to the whims of distributors of patronage, and where those who listen to conscience and reason rather than to public clamor are not likely to be reappointed to office. This evil has already deprived us of the services of men who were not properly qualified when appointed but who, through conscientious and hard work, had qualified themselves in some degree at least, an expensive system of education for the interests involved, and particularly wasteful when its one good feature is sacrificed to "politics" when the day comes for reappointment.

On the other hand, there will be found some members of the engineering profession, as of other professions, properly qualified, and blessed with enthusiasm together with independent means or simple wants and tastes, who will be willing to face all of these objections for the satisfaction of knowing that they are performing a public service.

This very difficulty in obtaining men of the necessary character, ability, and training points to a very real objection to this bureaucratic form of government and the need for readjustment along lines of greater simplicity and less power.

To summarize: our public service commissions should be composed of common-sense men, broadly trained, broad-minded, fair, and competent as investigators (an unusual qualification); and in each commission there should be men fully qualified in the theory and practice of the professions of engineering, law, business, finance, and accountancy.

THE PARTNERSHIP PROVISIONS OF THE KANSAS CITY FRANCHISE

By PHILIP J. KEALY

Member of Board of Control Kansas City Railways Company

WITHIN the past ten years a great change has come about in the attitude of the public toward the granting of franchise contracts to public utility companies. During the eighties and early nineties the country was carried away with the possibilities of electric traction, urban and interurban, and with the prospects of cheap electric light and power. The urban population had increased greatly, and the standard of living, at least as to conveniences, was raised. As a result, every encouragement was given to capital to invest readily and bring to the community, large or small, the electric car, electric light and power, gas and water, former luxuries which had become necessities. Franchises were to be had for the asking, and competition and duplication of plant were encouraged. Furthermore, no referendum vote was required, and the political standards differed materially from those of to-day. Franchises were limited in many states by constitutional provisions to a term varying from twenty to thirty years. These older grants have, therefore, either expired or are about to expire. Consequently, a readjustment of the relations between the public and the utilities has been made, or is under way, in many of the cities within recent years.

The limited-term franchise, carrying no protection for permanent investments, has not proved satisfactory. Abuses of many kinds existed, and public service has been largely for private gain. Municipal ownership has many advocates. Therefore, in the readjustment of the relations between the municipality and the company there are two methods by which the distrust and dissatisfaction which exists in the mind of the public, be it just or unjust, can be removed or pacified. These are, first, municipal ownership, and second, supervision by public authority over those features of the company's affairs directly affecting the public welfare or the city's interest.

> **"The interests of the community and the private company furnishing public service to that community are identical and the interests of each can be best served by concerted and mutual action."**
>
> —*Philip J. Kealy.*

The passage of public service commission laws in many of the states has affected the second method in so far as mere supervision of many features of the company's affairs are concerned, but the spirit of the day tends to confirm the assertions long before made by public utility corporations that the interests of the community and the private company furnishing public service to that community are identical, and that the interests of each can be best served by concerted and mutual action. However, no public service commission law yet passed provides for a detailed participation in, or supervision of, the affairs of a private company, something essential in a partnership management. Therefore, where the city is interested in other than the mere standard of service furnished, a closer affiliation with and participation in the company's business is necessary than that which most public service commissions can undertake under the laws which created them.

The Chicago ordinances of 1907 were, perhaps, the first tangible expression of the idea of public participation in private management, and it is significant that an amendatory ordinance, passed a few months ago, increased the powers and broadened the scope of the activities of the Board of Supervising Engineers. In the Cleveland settlement a somewhat different arrangement exists, but this is due to the fact that the city's interest in this case is solely in good service at minimum rates, whereas in Chicago, in addition to securing good service at minimum rates, the municipality participates in the profits.

In the preparation of the franchise granted in Kansas City, Mo., on July 7, 1914, the conditions hereinbefore discussed were duly considered, as were also the plans evolved in Chicago and Cleveland. At about the same time, one of the local newspapers started a campaign for a "disinterested management of the traction company." This doctrine, however, met with little favor. It was charged that the company's difficulties were due to financial mismanagement about ten years previous. It was further charged that the burden of this alleged mismanagement was borne largely by the community, since, because of the inability of the company to secure funds with which to make needed improvements, it was forced into a receivership and the extension and betterment of its lines was delayed. Of course, the investors in the property suffered, as no dividends were paid; and the public suffered also. Inasmuch as the shareholders had a voice in the management of the company, while the public, which was likewise concerned, had not, those on the city's side of the controversy, who were contending for the widest possible participation by the city or its agents in the company's affairs, had a very strong argument on their side.

To meet this general situation there was devised a plan of city participation in the management which varied widely from any yet proposed in a franchise settlement, and as might have been expected, the Kansas City contract, being the last franchise ordinance adopted in this country, is perhaps somewhat more radical in regard to partnership provisions than any of its predecessors. The new contract essentially places the two contracting parties in different relative positions than those resulting from either that in Chicago or in Cleveland.

The essential features of the Kansas City ordinance, in brief, are as follows: In the first place the value of the property is fixed, and on the fixed value it is agreed that the company shall be entitled to a 6 per cent return, "if and when earned." Of the total agreed value of $30,000,000 approximately $7,500,000, or 25 per cent, represents intangible elements of value. It is further agreed that before the company participates to any extent in the earnings over and above the fixed return of 6 per cent, all excess earnings shall be put back into the property until the $7,500,000 of intangible value shall have been made good with physical property, and without any increase in the capital account. When this has been accomplished, the company and the city are to divide the surplus earnings over and above the 6 per cent return in the proportion of $2 to the city and $1 to the company.

The city is to receive certificates of ownership for the intangible value made good out of earnings, and the contract also provides that if the city shall devote its portion of the surplus towards the purchase of the property, then when one-half of the capital value has been so paid down, the city shall assume the ownership of the entire system, subject to a mortgage indebtedness of the other half.

The contract further provides that the city may secure the property at any time upon giving sixty days notice and paying the agreed value. The city, therefore, is interested in the manner in which the company is financed, in the amount of capital additions, and must necessarily watch all the operating expenses closely.

That all these various interests of the city may be properly safeguarded, the contract contains the following general partnership provisions:

1. The company is to be incorporated with eleven directors, five of whom are to be nominated by the city.

2. Those features pertaining to the detailed operation of the road are to be handled by a board of control, consisting of two members, one appointed by the company and one by the city, each of equal authority, and, in case of dispute, provision is made for the selection of an arbitrator.

3. Whatever mortgages are placed upon the

property must be drawn up in a manner satisfactory to the city counselor and approved by him in writing.

4. An independent audit of all books, vouchers and expenditures of the company shall be made annually by the city comptroller.

The following paragraphs give additional details regarding the above provisions:

1. The city directors are initially selected for a term varying from one to five years, and thereafter one director is to be selected each year. In addition to the powers given the directors by law, the new contract grants many other rights or powers to them. For example, the city directors may reject any and all bids for material and work constituting capital additions, and they have the sole right to determine where track extensions to the system shall be made. They may also object in writing to the payment of excessive compensation to any employee, officer or agent of the company, excepting that of members of the board of control. Such objection is to be considered by the board of control.

Through this representation on the board of directors, the city is at all times cognizant of the financial affairs of the company and will, in addition, assist in its financing and reorganization. This form of city participation is, in many respects, an innovation and approaches as closely as is possible the ideal of public management of private property.

2. The board of control, in brief, is charged with the following duties:

a. To supervise and direct the routing, stopping and scheduling of cars, either in accordance with ordinances of the City Council or order of the Public Service Commission, if the latter should possess the final authority in the matter.

b. To require sufficient cars to be operated at all times and approve type of these.

c. To designate and approve the kind, character and amount of all construction and reconstruction equipment and re-equipment.

d. To certify to the amounts of all capital expenditures.

e. To determine the system to be used in keeping the company's books and to supervise all disbursements.

f. To regulate the issuance of transfers.

g. To recommend a site for an interurban station and to determine in general the many features connected with the use of the city system by interurban roads.

h. To regulate the carrying of mail and packages on the cars.

i. To determine the amount to be annually expended or set aside for maintenance and renewals and for injuries and damages, it being provided that not less than 16 per cent shall be set aside for maintenance and renewals, and not less than 4 per cent for injuries and damages.

> **"While this franchise undoubtedly has faults, the sincere hope and expectations of all parties who have assisted either in its preparation or final adoption are that it will carry out the true purposes of a public service franchise, provide the best possible service at minimum rates, permit a fair return on the capital invested and insure public service confidence by making the public, through its delegated authority, share the responsibility."**
>
> —*Philip J. Kealy.*

j. To see that the property is at all times insured to its full insurable value.

k. To fix the terms under which surplus power shall be sold.

l. To dispose of any property which is, or may become, in their opinion, unnecessary for the company's business.

Thus it will be seen that the board of control has supervision and initiatory power over every phase of the operation of the system, and on this board the city has equal representation and rights.

3. The provision that all mortgages covering the property are to be satisfactory to the city counselor and approved by him in writing is another innovation. Whether this will prove to be a point of strength in the partnership relations only experience will show, but in theory, certainly, it is correct, for the city, being interested equally with the company, in every phase of the latter's business, should necessarily have a voice in deciding what sort of a lien should cover the equities owned by it.

4. The independent audit, which is to be made annually under the direction of the city comptroller, is a provision which is copied from the Chicago ordinance. Whether or not this is necessary is an open question, as the local contract places the members of the board of control who will supervise the company's expenditures in a somewhat different position from that of the Board of Supervising Engineers in Chicago. There, the chairman of the board, who is the arbitrator, is named in the ordinance and represents neither the city nor the company, but stands for the best interests of both. He can be removed only by a majority vote of the judges of the Appellate Court of Cook County. In Kansas City, however, the board of control consists of two members. The city's member can be removed by a majority of the city's directors and the Mayor. The arbitrator, however, is to be selected by the judges of Kansas City Court of Appeals.

In accounting matters upon which the board of control may disagree, and which therefore, go to arbitration, the company is at a disadvantage in that a public body selects the arbitrator to decide the question at issue. Therefore, the necessity for the independent audit is questionable.

Numerous additional partnership ideas are included in the Kansas City contract. It is further provided that in the contemplated reorganization all of the stock of the new company formed to take over the present Metropolitan system is to be deposited in the hands of Judge Hook of the United States Circuit Court, and the equities are to be distributed by him. This insures a fair division and makes certain that each stockholder will receive that to which he is entitled in the final plan.

From the above it will be evident that virtually every partnership idea which has yet been incorporated in a public utility contract is found in the new Kansas City franchise. In addition, many innovations, some of which have been discussed by men prominent in public utility affairs, and others which are original, are likewise embodied.

The best interests of both parties make necessary a strict compliance with the contract. No human document is perfect, and while this franchise undoubtedly has faults, the sincere hope and expectation of all parties who have assisted either in its preparation or final adoption are that it will carry out the true purposes of a public service franchise, provide the best possible service at minimum rates, permit a fair return on the capital invested and insure public confidence by making the public, through its delegated authority, share the responsibility.

LOCAL VERSUS STATE REGULATION

By RICHARD McCULLOCH

Vice-President United Railways, St. Louis

WHEN in 1907 the states of New York and Wisconsin passed laws turning over the regulation of their public utilities to state commissions and gave these state commissions the widest powers, it was supposed by economists, reformers and lawmakers that a new era had dawned in the matter of regulation of public utilities and that these commissions would proceed immediately to solve all of the problems connected with the financing, management and operation of public utilities. Most of the other states followed the lead of New York and Wisconsin, and nearly all of them now have public utility commissions possessing more or less absolute powers.

Now, after state public service regulation has been in vogue for only seven years in two states, and for shorter periods in others, there has arisen in certain quarters a new demand to take these regulatory powers away from the states and to place them in the hands of municipalities.

It would be interesting to analyze this demand and to determine the reason for the sudden change of opinion. Several articles published in the May, 1914, number of the *Annals of the American Academy of Political and Social Science* discuss this matter from the standpoint of local regulation. The following extract is taken from a paper by Delos F. Wilcox on the "Effects of State Regulation Upon the Municipal Ownership Movement."

"Generally speaking, * * * the popular prestige of public service commissions is waning. The people are disappointed in the results obtained for the money spent, and a great many are coming to fear that the commissions as organs of government are primarily organs of the public utility interests to protect themselves from the mosquito bites of rampant democracy. At the same time there is a noticeable revival in the movement for municipal ownership and a strengthening of local resistance to the practical abrogation of municipal home rule as it relates to public utilities."

One of the allegations repeatedly made by the advocates of local regulation is that, while at first state regulation was fought by the public utility companies, it is now being urged by them, and that the recent passage of public utility laws in some of the states has been inspired by public utility interests.

Examining the recent literature on the subject the arguments against state public utility regulation and in favor of local regulation are about as follows:

1. With few exceptions men occupying positions on state commissions have had no qualification for this work, but have been appointed for political reasons.
2. State regulation has not given the people the benefit of as favorable rates nor as good service as many cities, with home-rule powers, have secured for themselves.
3. In the valuation field, both for rate making and purchase, the state commissions have shown a strong leaning toward the interests of the utility companies.
4. An analysis of the cases passed upon by one of the most important commissions shows a very small percentage of cases in which municipalities have received relief.
5. The commissions move with extreme deliberation, and their orders have frequently been nullified by appeals to the courts by the utilities.
6. The commissions are developing a growing disposition to write legislation and thus control the action of state legislatures in the public utility field.
7. The commissions interfere with the management of municipally owned plants.

These allegations may be answered as follows:

1. If it has been difficult to find men qualified to occupy positions on state commissions, how much more difficult would it be to find suitable men for municipal commissions where ward politics and local prejudice have much to do with appointments? As a matter of fact, the appointments on state commissions have been much above the average, and these commissions, after several years of work, have collected statistics and have trained experts who are invaluable to them in their present work. Would municipal commissions do as well?

2. Where municipalities have made better bargains with their public utilities than could have been exacted through regulation, it means merely that these bargains have been driven by the municipalities by cut-throat methods of which they need not be proud. The present condition of the franchise negotiation in Toledo is a shining example of this method of bargaining.

3. In the valuation field no fair-minded man has ever accused a state commission of showing partiality toward the interests of the public utility companies. On the contrary, few valuations have been made by state commissions where the utility has received credit for all to which it was entitled.

4. If an analysis of cases passed upon by a well-known commission shows a small percentage of cases in which municipalities were afforded relief, it indicates merely what every operator knows, that a large percentage of complaints brought before commissions are of a trivial nature or not founded upon facts.

5. If the commissions have moved with deliberation, they have done so to preserve a judicial attitude, and if their orders have frequently been nullified by appeal to the courts, the same might be said with greater force of the orders of a municipal commission.

6. If the commissions are developing a disposition to write legislation, we are at least sure that this legislation is written by experts. Can the same be said of legislation on public utility matters proposed by the average lawmaker?

7. If the commissions have interfered with the management of municipally owned plants, it is probable that these plants are woefully in need of some sort of intelligent interference and relief from government through municipal politics.

Considering these charges as a whole, it would seem that the chief cause of complaint against state commissions is that they have not adopted a sufficiently militant policy and have not made the drastic rulings against public utility companies which were expected of them by those instrumental in the passage of the original public utility regulation acts.

The men appointed to membership on state commissions have, as a rule, been men of ability and character, and if, as alleged, they have at first lacked experience in public utility matters, the commissions in most of the states have now been working long enough to acquire experience, to assemble a technical staff and to collect valuable statistics. This period of incubation has been a trying one for the utilities, but now that the state commissions have been well organized it would be unfortunate if the whole process had to be gone over again with municipal commissions.

> **"Regulation is of value in proportion to its fairness and impartiality. Commissions, whose members are not personally concerned with local matters, will give better decisions than those whose members are so involved. The farther removed the commission is from the seat of contention the more judicial will be its attitude. On this account state regulation is better than municipal regulation, and federal regulation would be better still."**
>
> *—Richard McCulloch.*

Few of our important public utilities are confined to one municipality. They are interurban and often interstate in their ramifications. Regulation of such utilities operating in many municipalities by independent municipal commissions would be a clumsy, if not an impracticable, expedient. It would work great hardship on the utilities, and there appears to be no advantage to the public in such a diversified regulation.

It has been the universal experience with municipal commissions that in order to keep themselves busy they take up the most petty and trivial matters and endeavor to constitute themselves managers and directors instead of maintaining a judicial attitude.

Under the theory of public service regulation the commission occupies a neutral attitude as between the public and the public service companies. They see that the companies fulfil all their obligations, but, on the other hand, they protect the utilities against useless duplication and against unfair demands on the part of the public. In order to perform these duties, the commissions must weigh the evidence on both sides, and they must hand down their decisions after taking into account the rights and the obligations of each party.

It is often stated that the utilities have the right of appeal to the courts, but public utility companies must rely upon proving their cases before the commissions, because, although the acts of the commissions are subject to court review, the utility which appeals to the court is put in the unfortunate attitude of fighting the State. This attitude of waging war on the community is always made the most of by the enemies of the utility.

Regulation is of value in proportion to its fairness and impartiality. Commissions, whose members are not personally concerned with local matters, will give better decisions than those whose members are so involved. The farther removed the

"When state commissions have pointed out to municipalities the defects in construction or operation of their utilities or their unfairness toward their customers, this advice has seldom been graciously received."
—*Richard McCulloch.*

commission is from the seat of contention, the more judicial will be its attitude. On this account state regulation is better than municipal regulation, and federal regulation would be better still.

In the city of St. Louis we are perhaps well qualified to judge as to the relative values of local and state regulation, having had for several years a municipal commission which has now been replaced with a state commission. The municipal commission was composed of a lawyer, an insurance man and a city official, who became chief engineer of the commission. None of these gentlemen had had previous experience in the construction, operation, valuation, financing or investigation of public utilities.

They fearlessly proceeded, however, with an examination and valuation of all the utilities, and made recommendations in the most vital matters of operation and finance with the utmost *sang froid.* They recommended that the lighting company be allowed to earn 8 per cent on the appraised value of its investment, but limited the railways company, conducting a business of much greater hazard, to an earning rate of 6 per cent. As a result of their valuation and investigation they recommended the enactment of a municipal ordinance requiring the railways company to furnish at all times of the day one car for each fifty passengers, which was really a requirement for a seat for every passenger at all hours of the day. If the commission had allowed the railways company the same rate of earnings as it had already established in the case of the electric lighting company, no demand for increase in service could have been justified. Fortunately the proposed legislation to put this recommendation into effect was not passed, and the efforts of the municipal commission were partially recognized by its replacement by a state commission before it had an opportunity to make any more recommendations. When its demand for a seat for every passenger was answered by the argument that this had been accomplished in no other American city and had been required by no other commission, it replied that this made no difference, and that St. Louis should be the first to put this millennium into effect.

A municipal commission is too close to the seat of contention, too apt to be swayed by prejudice, local influence or newspaper attacks, too ready to respond to the passing whims of half-baked reformers and demagogues, to take that broad judicial view of matters presented to it which is necessary in order to render a fair decision on the important business matters brought before it.

An interesting feature of state regulation is the fact that in many of the states the commissions have regulatory powers, not only over privately owned utilities but over those owned and operated by the municipalities. When state commissions have pointed out to municipalities the defects in construction or operation of their utilities or their unfairness toward their customers, this advice has seldom been graciously received.

An interesting incident in connection with the Missouri state commission has recently occurred. Upon complaint of citizens of St. Louis County, the state commission investigated the conduct of the St. Louis County Water Company, a privately owned concern. After investigation, the commission ordered the company to perform certain duties, which were, among others, to furnish water meters free of charge, refund money to customers who had paid for their meters, pay interest upon deposits, etc. The finding of the commission was received with great satisfaction by the newspapers and the public. When, however, the commission notified the municipally owned water department of the city of St. Louis that it must obey the same rules laid down for the county water company, there was great uproar from the newspapers and the politicians. The following editorial from the St. Louis *Star,* under the caption, "Grabbing the Water Works," shows the attitude of the newspapers toward state regulation of municipally owned utilities:

"The State Public Service Commission has issued a number of orders concerning rates, management and regulation of water works, which will, if enforced, cause a raise in water rates as well as the loss of several hundred thousand dollars a year to the city of St. Louis. The orders were made by the commission to apply to public utilities owned by corporations in all parts of the State, but the commission included St. Louis among the cities to come under the new regulations.

"The new rates apply to water, gas and electric power. One of the rules would compel the city to buy all water meters now privately owned, which number more than 3000. Another regulation would compel the city to pay 6 per cent upon all deposits to secure the water bills. This alone would add $50,000 to the cost of operating the water department. At present the city requires water consumers to deposit money sufficient to pay the estimated amount used for six months. To pay interest on this and to buy the privately owned meters would mean a huge increase in the water rates, merely to gratify the whim of a politically appointed board."

We might cite the homely adage, "What is sauce for the goose is sauce for the gander," but it is evident that this sauce is not to be applied without hysterical squawking on the part of the gander. Meanwhile, we well-plucked geese will extend our sympathies to the outraged gander, welcome him to our well-regulated circle and assure him that he might as well get used to the sauce and pretend that he likes it.

CO-OPERATION IN TRANSIT CONTRACTS

By TIMOTHY S. WILLIAMS

President Brooklyn Rapid Transit Company

WHILE smaller municipalities are scrapping with public service corporations in a spirit of vindictiveness and oppression which bodes no good to either party in the combat, it is encouraging to note that the largest cities of our country have committed themselves in their important transit undertakings to the more reasonable attitude of co-operation.

Chicago, New York, Philadelphia and Boston, together with some smaller cities, have, in varying degrees, as expressed in comparatively recent ordinances and contracts, apparently come to appreciate the unescapable truth that under existing conditions enlightened municipal self-interest demands co-operative effort with their carrying corporations —not retaliation, blackmail, punishment or oppression.

There never should have been any other conception of public attitude and duty. Where, as in urban transportation, municipal privilege is a necessary preliminary to the furnishing of adequate facilities by others than the municipality itself, the grant of such privileges was not properly the opportunity for personal graft or of unreasonable official exaction. It was the opportunity for wise public service, the procuring for the people of the best transit at the least cost and under reasonable safeguards, accompanied by a frank recognition of the justice and wisdom of ample returns upon private investment. For only as the commodity, transportation, thus purchased yields a profitable return to the producers can its quality be long satisfactory to the buyers.

This in its full scope could not have been foreseen in the early days of franchise grants, when street railroad transportation was in its infant and experimental stage, but later, when its influence on municipal development was manifest, and when the conditions which permitted profit or loss were more readily calculable, a wise appreciation of the advantage to the cities of businesslike co-operation with the carriers would have avoided much wasteful duplication of capital, would have made the development of city transit more uniform and intelligent, would have given the city governments a firmer and more practical control of service, and would have prevented many of the evils and scandals which have characterized a shorter-sighted policy. Instead of public interest, the personal or political interests of officeholders too often dominated the grant of franchises, city governments were too frequently the facile instruments of blackmail, grants were often made without necessity or reason, and the greed and official disloyalty of officeholders was reflected in the indifference of franchise-holders toward the obligations of their contracts.

When, out of conditions for which the people and their official servants were primarily responsible, the evils became unendurable, the pendulum swung in the opposite direction, the franchise-holder became the target of official attack of every kind, and no new or renewal franchises were forthcoming except upon conditions which prohibited or discouraged honest investment. And this opposite swing of the pendulum unfortunately reflects the situation very largely in our cities to-day. Burdensome and restrictive legislation or official orders are increasing the expense of service, crippling the ability to improve facilities or to add to them, and even when the disposition and the capital exist for enlargement of facilities, the city governments too often prohibit them by insistence upon terms and conditions which are not merely unreasonable but impossible of wise acceptance. It seems to be only the intensity of suffering and the consciousness of helplessness otherwise which finally bring the community and its officials out of the close atmosphere of recrimination and suspicion and into the broader and more wholesome atmosphere of co-operation.

The example set by the big cities therefore in the movement toward co-operation with traction corporations for the improvement of transit conditions marks the beginning of a new era in the handling of these matters. What are the characteristics of this co-operative effort and how will it work out?

In each of these important cities the particular conditions leading to new contractual transit relations were different, in each the purposes sought were worked out in different ways, in each the extent and character of municipal co-operation differed, but it may be said of the new contracts compositely that they:

Recognize the necessity of utilizing existing transportation facilities as the basis for a larger and better system;

Respect the private rights of property, both intangible and tangible;

Reserve to the city a large measure of control over service, equipment and operations;

Make provision for the extension of lines and the construction of new lines;

Require a strict system of accounting and an official audit;

Reduce the rate of fare either actually or by extension of haul or interchange of transfers;

Provide for immediate or eventual municipal ownership, in whole or in part, without commitment to municipal operation;

"Burdensome and restrictive legislation or official orders are increasing the expense of service, crippling the ability to improve facilities or to add to them, and even when the disposition and the capital exist for enlargement of facilities, the city governments too often prohibit them by insistence upon terms and conditions which are not merely unreasonable but impossible of wise acceptance."

—*Timothy S. Williams.*

Assure by contractual terms, if not by direct guarantee, a preferential return on private investment;

Make necessary the establishment of reserve accounts and provide for the amortization of capital;

When reserving to the city the right to terminate the contract, or to take over property at expiration or prior termination, establish safeguards for determination of and payment of compensation;

Require a generous division of earnings with the municipality;

Enlist the endeavors of operators by the allowance of fair terms, the protection of honest investment and the opportunity for reasonable returns; and

Recognize the necessity and equity of a contribution of municipal credit and privilege in order to procure a large measure of transit facilities under the severe conditions exacted for the city's advantage.

Not all of these contracts are as wide in scope as this composite picture, and some have additional features of interest, but they all illustrate in greater or lesser degree a broader and juster conception of enlightened co-operation between city and railroad corporation than has heretofore attended such contractual undertakings.

In Boston the new co-operative contracts involve mainly the contribution by the city of large amounts for the construction of subways for rapid transit and the relief of street congestion. The railroad company operates the new facilities in connection with its own and pays a rental. In time the rentals will have paid for the cost and the city will have a valuable asset free. In the meantime the people will have had the benefit of better facilities.

In Philadelphia the reasons declared for the co-operative contract of 1907 were (*a*) to terminate the dispute and uncertainty as to existing franchises; (*b*) to give the city "a voice in the management of the company and a supervision of its accounts and expenditures"; (*c*) to enable the company to raise the funds necessary to "improve, complete and extend" its system, "in order that it shall better serve the public," by clearly defining the company's position, making its securities unquestioned, and its right to make extensions assured, "in order that it may obtain credit to finance the increased transit facilities so necessary for the welfare of the public and the development of the city"; and (*d*) to readjust the payments by the company to the city, make the city a sharer "in the earnings of the company from further growth of the city (without making the city liable for any of the obligations of the company)," and provide for "the ultimate acquisition by the city of the leaseholds and property of the company."

These liberal purposes were liberally provided for in the contract, and the city was to have a representation of three in the company's board of directors. Operations under the contract have been going on now for seven years, and presumably with general satisfaction, for it is proposed by the Department of City Transit, with the apparent concurrence of the Philadelphia Rapid Transit Company, to further extend the principle of co-operation by the construction and equipment of new rapid transit lines, to be operated in conjunction with existing lines as a unified system, the city contributing toward the cost approximately $45,500,000 and the company $12,000,000. The company is to operate the new lines for fifty years, with a preferred charge on the net earnings for its interest and sinking fund. The city's interest and sinking-fund charges are a subsequent claim on the net earnings. At the end of the period the city takes over the entire property, paying the company the amount of its investment in equipment and applying any accruals in the company's sinking fund for that purpose. In addition, under the 1907 contract as proposed to be extended, the city at the same time may take over all the company's lines upon paying the price therefor as stipulated in the contract. The annual payments to the city out of earnings are expected to provide a large part, if not all, of this purchase price. Whether the Philadelphia contracts (present and proposed) are equitable in all respects will not be discussed here, but that they reflect to a large degree the new spirit of co-operation is indisputable. If they require a large investment by the city, it is the price which the city has to pay for facilities presumably needed by its people, and these could not possibly be procured otherwise so cheaply or satisfactorily to its people as by co-operation with the transit company. The company, on the other hand, makes large sacrifices in concessions demanded, as for instance reductions in fares and surrender of possible profits over a moderate return, and by these sacrifices and concessions indicates a praiseworthy disposition toward co-operation.

In Chicago the new contracts (originating in the same year as that of Philadelphia) were the outcome of a vote of the people for municipal ownership. The situation was favorable for an advantageous bargain with the street railroad companies, for a large part of their franchises had expired. It was unfavorable for immediate municipal ownership because of the limited borrowing capacity of the city. It required prompt attention because, as usually happens near the expiration of short-term franchises, the railroad facilities had been allowed to deteriorate, there being no assured terms of renewal. The problem concerned only street surface railways.

The outcome of the negotiations was novel and apparently generally satisfactory to both parties. The contracts as executed establish an agreed value of $50,000,000 for the tangible and intangible property of the companies. It was a compromise figure. Upon this valuation, plus the cost of rehabilitation and extensions (borne by the companies) the companies are allowed an interest return of 5 per cent per annum. The remaining net profits are divided between the city and the companies in the ratio of 55 per cent to the city and 45 per cent to the companies. The result of seven years of operation has been not only the reconstruction and extension of the system, the improvement of service and equipment, and a comprehensive system of transfers and through routes, but the receipt by the city of about $13,000,000 as its share of divisible profits. Moreover, the city has the option to purchase and take over the property at any time upon payment of a prescribed amount. If taken over for municipal operation prior to Feb. 1, 1927 (twenty years), the price is to be the agreed valuation ($50,000,000), plus the cost of additions, reconstruction and improvements, reduced by the value of any property lost, destroyed or impaired (ordinary wear excepted), which latter value is supposed to be made good by depreciation funds. If taken over free from such restriction prior to that date 20 per cent is to be added to the price. In case the street railways are not thus purchased prior to Feb. 1, 1927, the city may designate any corporation to acquire and operate the railways as its licensee, in which case the licensee must pay the same price as the city would be obliged to pay.

In order that the city should have a voice in the character and cost of improvements an impartial board of supervisory engineers is created, whose approval is necessary to the plans and expenditures therefor. Extensions of tracks may be required but under restrictions which reasonably safeguard the companies' investments. The city is given a large measure of control over service. The rate of fare is fixed at 5 cents, but the city may, if it chooses, apply any part of its share of net profits toward a reduction of fares, provided that the companies shall be entitled to deduct and retain from the net receipts an amount equal to what their share would have been had the passengers carried paid the fare prescribed in the ordinance. This provision is probably too uncertain in its working to be availed of—but it is important as recognizing the just principle that the cost of an enforced reduction of fares diminishing the measure of contractual returns to the operator should be borne by the city, and not by the operator. This principle is again recognized in the new operating agreement of Dec. 22, 1913, whereby, besides reaffirming and in comparatively minor respects modifying the 1907 contract, the city, in order to extend the benefits of unified operation and a 5-cent fare to other parts of the town reached by another railway, reduced the fare on the Calumet & South Chicago Railway south of Seventy-ninth Street from 10 cents to 5 cents, but agreed to compensate the company in cash for such reduction.

Chicago has thus, so far as surface transit is concerned, solved in a businesslike and reasonable way the problem which confronted it. Because of the expiration of most of the street railway franchises when the bargain was negotiated, the city was able to make terms on a more advantageous basis with the existing companies than it could have made by ignoring them and contracting with new and independent interests, or by the creation of a municipal system, had that been financially possible. It gets a substantial part of the measure of control which would have come with immediate municipal ownership. It is assured a cheap fare and extensions of tracks where required. And it is placed where by husbanding its share of earnings it may acquire the railways within a reasonable period without serious burden, if any, upon the taxpayers. For these advantages it naturally made concessions which the extremists have criticised—although these were not only equitable but necessary to the investment of private capital. Its contract is liberal in the accounting, measured by radical standards. It recognizes, as have our courts, the substantiality of intangible rights, created though they may have been primarily by official or legislative privilege, as well as of tangible, physical property. It properly assumes that cost of property is not in large undertakings limited to the purchase of material and labor, but includes interest, discount and commissions, and contractors' profits. In the radical reconstruction of existing facilities, including the change from cable power to electricity and other substitutions made advisable by changes in the art of railroading, it abandons the doctrinaire idea that these improvements must be in all cases paid for out of earnings, and adopts the saner and more practicable conception that the cost of progress, if progress be attained, must often be capitalized.

The conditions which led to co-operative methods in New York were different from those in each of the other large cities.

The city had laid the foundations for a municipal rapid transit system by its contract in 1900 with John B. McDonald, afterward assigned to the Interborough Rapid Transit Company. Under that contract city capital created subways, private capital equipped them and a privately owned corporation operated them. Strange as it may seem, considering the criticisms

> **"By recognizing existing corporate utilities, protecting their earning power as a basis for new credit, enlarging their opportunities for usefulness by grants of new privileges, supplementing their old and proposed facilities by new city-owned lines, and inviting the investment of new capital by reasonable insurance of returns, the city [New York] could accomplish more for its people than by any other course, could control for itself the future scope and effectiveness of rapid transit, and could look forward eventually to having a complete system of its own to operate or lease as it may choose."**
>
> —*Timothy S. Williams.*

which had attached to the character of other franchises following their profitable utilization, this new municipal transit effort embodied the most remunerative opportunities to private capital and energy which had ever been afforded in any municipal franchise—although it must be admitted that in obliviousness toward these opportunities most of the experienced men in the traction business were as serene as city officers and municipal reformers. Not only was the route laid out (considering as one for this purpose both contract No. 1, covering Manhattan and a small portion of the Bronx, and contract No. 2 comprising the extension into the heart of Brooklyn) through the congested part of the most populous city of the continent, but the low interest charge made possible by city credit, the freedom from taxation, the comparatively small requirement of private capital and the moral support of the city gave the enterprise a very great advantage over any similar undertakings dependent solely upon private funds. Profitable as it proved to be to those who had the courage to undertake it, the new subway was of even more profit to the city and its people—it gave a much-needed relief to transit conditions, stimulated property values and not only yields to the city interest on the cost but is gradually amortizing that cost.

The weakness of the McDonald contract, however, from the city's point of view, was revealed as conditions became more aggravated, namely, its powerlessness to compel extensions or branches and its failure to provide for any interchange of traffic (except for double fares) with any other subways which might be constructed and operated by the city or private interests other than the Interborough. Notwithstanding the great and insistent demand for additional rapid transit facilities, the city was helpless to provide them by an extension of its own railroad except upon terms which it was unwilling to make. Apparently secured in profits, and, practically, in monopoly, the city's lessee had the whip hand of the situation.

It was at this juncture, ten years after the first subway contract had been entered into, that a special committee of the Board of Estimate, of which the Hon. George McAneny was chairman, began a special study of the subject in combination with the Public Service Commission for the New York district, and finally brought about the co-operative contracts of 1913, which in the scope of their requirements, the magnitude of their capital investments, the comprehensiveness of their territorial influence and the care with which their terms were formulated, mark them easily as the foremost constructive work of their kind in the world. Their significance, for the purposes of this paper, is the extent to which, for the good of the community, they have recognized the necessity of, and made possible the accomplishment of, intelligent co-operation between city and railroad corporations.

The New York contracts have to do only with rapid-transit lines and service. Both the Interborough Rapid Transit Company and the Brooklyn Rapid Transit Company have surface railway interests, but these are not involved, except as they are indirectly affected by the success of the rapid-transit lines in diverting travel. The city deals with two operators—the Interborough Rapid Transit Company, controlling by lease the first city-owned subway lines and the after-acquired Manhattan elevated lines; and the New York Municipal Railway Corporation (organized on behalf of the Brooklyn Rapid Transit Company) controlling the Brooklyn elevated lines with three former steam-railroad connections. The contracts call for the immediate construction of approximately 362 track miles of new subways, elevated railroads and additional tracks on existing railroads, and the necessary accompanying additional facilities of equipment, power, shops, etc. The estimated expenditure of new capital is about $320,000,000, of which the city contributes nearly one-half. The routes traverse all boroughs except Richmond, and that borough, because of its insular position, prospectively. They are competitive only by incident—the idea being to extend the Interborough Company's Brooklyn line further into that borough through a territory where there is no rapid transit now, and to give to the Brooklyn company subways in Manhattan between Fifty-ninth Street and the Battery for the distribution of its Brooklyn and Queens passengers. While serving some common territory each system is reasonably complete in itself. There is to be one 5-cent fare over the lines of each system—not over both. Both systems are physically capable of unified operation without the handicap of much duplication of capital—but such operation would not be possible financially at a 5-cent fare for a long time to come, because of the great distances and expensive construction.

In order to procure the advantages which the city sought for its people and to reserve to itself full powers of control, concessions were necessary to the companies. The earning power of existing lines as of certain years was made a first charge on net receipts, thereby procuring the concurrence of the Interborough company. In the case of the Brooklyn company this was less than 6 per cent on the investment. In the case of the Interborough subway lines it was estimated at over 13 per cent. On the Manhattan elevated lines it was something more than 7 per cent on the capitalization. In addition, the new capital furnished by the companies is allowed a preference out of earnings as to interest and sinking fund. Return on the city's investment comes next—and then divisible profits, if any, half to the city and half to the companies. The city after ten years may take over any of the new subway lines, or the additional tracks and extensions of privately owned elevated lines, with their equipment, upon paying stipulated sums representing the company's contribution of cost and a moderate profit, which sums gradually diminish, until at the expiration of the full term of forty-nine years the city gets the property without payment, except for additions to the extent that they have been unamortized. The powers retained by the city over contracts both for construction and operation, over accounting, and over service are as broad as they well could be. The city's ability to enforce the construction and operation of extensions of each system without the imposition of an additional fare is secured, but if done without the operator's concurrence the burden of cost of construction (other than equipment), and any deficits in operation are borne by the city. This is a proper safeguard against reckless extensions.

The significant aspects of the New York contracts, as bearing upon co-operation, are first,

That, as to new construction, the character and mileage were such as to preclude investment of private capital alone, upon the tenure and terms of possession set forth; second,

That the city had not the financial ability alone to carry out the whole undertaking; third,

That any partial efforts toward transit relief by the city to the extent of its available funds could only benefit a portion of the large population; fourth,

That confining municipal privilege and financial assistance to either one of the two important traction corporations would be unjust to the other and to the constituencies served by it; and, fifth,

That by recognizing existing corporate utilities, protecting their earning power as a basis for new credit, enlarging their opportunities for usefulness by grants of new privileges, supplementing their old and proposed facilities by new city-owned lines, and inviting the investment of new capital by reasonable assurance of returns, the city could accomplish more for its people than by any other course, could control for itself the future scope and effectiveness of rapid transit, and could look forward eventually to having a complete system of its own, to operate or lease as it may choose.

"The final test of all these co-operative efforts is not merely the care with which the bargains have been made but the continuance of the co-operative spirit in their carrying out. This spirit is as essential for the corporation as for the municipality."

—*Timothy S. Williams.*

The companies, on the other hand, had much to gain from co-operation. The Interborough, though sacrificing the possibility of adding to its already large and growing profits, was thereby protected against a reduction of existing profits by the creation of competing lines. The Brooklyn company, struggling to serve a large area of rapidly increasing population but unable to do so without additional tracks across the East River and new terminals in Manhattan, rights for which only the city could give, was thereby released from the bonds which restricted its growth, was given the opportunity properly to serve its constituency, and was assured, with greater density of population in its wide areas, of a constantly increasing earning power.

The final test of all these co-operative efforts is not merely the care with which the bargains have been made but the continuance of the co-operative spirit in their carrying out. This spirit is as essential for the corporation as for the municipality. A disposition to evade the terms of contracts, either by the city or the corporation, or to take undue advantage of provisions not duly considered in advance, or of omissions overlooked, may produce a return to the old atmosphere of suspicion and recrimination which is always a great obstacle to effective service. It is quite probable, too, that the working out may reveal conditions not fully comprehended or foreseen by either party, and these must be met and handled with fairness and wisdom.

In contracting with private interests for the furnishing of transportation, the city's chief object should not be the money return to its treasury from its contributed privileges or capital, but the completeness of facilities and service for its people and the requirement of reasonable fares. It is particularly essential, however, unless we drift toward socialism, that where the city contributes its own capital toward the construction of public utilities, as in these contracts which have been cited, the burden of interest and cost should fall on the utility itself and not upon the taxpayers, and that the return from operation should be sufficient to cover such charges. If in addition to such return the city, while commanding generous facilities and service at reasonable fares, can by encouraging prudent management look forward to its participation in profits, applicable to relief of taxation or to other municipal projects, then the perfection of municipal bargaining and administration would seem to have been reached. Herein, however, lies a possible weakness. The officers entrusted with the carrying out of these co-operative contracts are not in all cases in control of municipal administration and policy. In New York they are appointive state officers. The danger is that the desire to please local interests, or to gain temporary political popularity, will preclude that steadfast and intelligent regard for wise and economical action which is most likely to be held by responsible city officers charged with broad municipal powers and obligations.

It seems to me, moreover, essential to the best co-operation on the part of the contracting corporation that there should be the inducement which comes from the possibilities of profits over and above the bare cost of capital. That expectation was the controlling motive which led the Brooklyn Rapid Transit Company to contract with the city of New York. While no such additional profits are possible until full interest and amortization charges on both the city's investment and our own have been earned, and while the period of divisible profits is not likely to begin until some years in the future, the possibilities for growth of business through the territory operated, and the comparatively low company preferentials to be first deducted from the earnings, give promise eventually of large surplus profits in which the city and corporation will share equally. It is of particular importance to the city and to its people that the realization of this expectation should be expedited by wise administrative action, for just as soon as the city's investment becomes self-supporting the government will have a large margin of credit available either for new transportation lines or for other municipal purposes—besides the annual payments of money profits into the city treasury.

Few contracts are safe which are all one-sided. The best and most enduring are those with which both parties are continuingly satisfied. It would seem as if, for a time at least, most of the advantages accruing from the co-operative contracts of the cities which I have mentioned would be with the people of the municipalities. The immediate satisfaction of the corporations is that of taking the choice of possible evils, in indulging in hopes for the future, and in the consciousness of public service. If co-operation proves successful—and profitable—the benefits under these particular contracts ought to be quite evenly distributed between city and corporation. One thing is reasonably assured, namely, that for some time to come there will be no such excess of corporate profits as excites the blustering babble of politicians and invites the attacks of legislators and office-holders.

WHAT MIGHT HAVE HAPPENED TO THE TALENTS

By L. R. NASH

Stone & Webster, Boston, Mass.

THERE was once in ancient days a certain rich man who, according to a parable in Holy Writ, sought relief from business cares by traveling into a far country, even as rich men do in these latter days. As in these days, he called to him his trusted servants and delivered unto them his goods. And unto one he gave five talents, to another two and to another one, to every man according to his several ability, and straightway took his journey. After a long time he returned from foreign lands and called his servants for a reckoning. We are told that he that had received five talents came and brought other five talents; he also that had received two talents had gained two other talents beside them. But he which had received the one talent had been afraid and hid his talent in the earth, so that he brought to his lord only that which had been his.

The respective rewards and punishments of these servants are well known and have been a guide and spur to faithful servants through the ages. Those were days in which anti-trust laws and regulation were unknown, and profits of 100 per cent in a few years were not uncommon. Let us consider what might have been the experience of these servants of ancient days had the present legislative methods and tendencies come into effect during the sojourn of this rich man in the far country, supposedly quite out of touch with his business interests. Let us recast the reports of the servants after the unheralded return of their lord in the light of present-day conditions.

The servant to whom had been given five talents might have reported as follows: "Lord, thou deliveredst unto thy servant five talents; behold he cometh unto thee empty handed. Alas, the tale is one of woe. After thy departure I straightway sought a safe and profitable way to use the talents intrusted to me. Walking in the market place I saw a drove of camels lately arrived from Damascus, laden with rich goods. The owner, who had carried goods to and from Damascus for many years with much profit, had suddenly been gathered to his fathers and the camel train was for sale. Thy servant bought the camels, although paying as much more for the good-will of the business as the camels themselves were worth. The venture proved successful, and later another camel train, carrying to Tyre, was purchased. Later others were added unto them, also storehouses and certain ships sailing from Tyre to other lands. All these uses of thy talents were profitable, particularly after all means of public travel had been bought up, and there was no man to limit the tolls on the burdens carried.

"But it came to pass that certain Publicans looked upon my growing business and declared, 'This man payeth not sufficient tithes into our hands; his storehouses and camels are taxed but he should also pay us from his gains.' And when they searched and learned of my large gains, grievous burdens of taxes were added.

"Then certain of the Scribes gathered together and reasoned among themselves that the carrying of burdens and travelers should not be committed to one man to exact such tolls as he may desire. They found in the books of the law that no man should have divers weights and measures, great and small, in his bag or in his house, which they interpreted to mean that all charges should be reasonable and alike to all. And forthwith they prepared new statutes which placed certain of the Elders over the carrying of burdens to see that just charges were made and that no man paid more than his neighbor. The law further decreed that the carrier of burdens was a servant, worthy of a servant's hire, but that all else belonged to the people whom he served.

"Then a traveler complained of a toll of five shekels, saying that three shekels was more than enough. The Board of Elders, therefore, determined to find what tolls would give a fair return on the property in use. And they valued the camels and equipment; and behold, they found that many of the camels were old and their present value very small, and they knew naught of good-will and cost of establishing the business. And the tolls which they fixed were grievously low.

"And it came to pass that other Scribes, reading the books of the law, found a commandment that no man should covet his neighbor's house, or ox, or ass, or other possessions. And they reasoned from this commandment that one should neither covet his neighbor's business nor acquire it, should it be like unto his own. They, therefore, passed a law further forbidding combinations in trade. Then there arose a magistrate who claimed that thy servant was unlawfully lading and sending forth camel trains in parallel or similar directions and having ships to receive and carry goods and passengers from them to other lands. After due hearing, it was decreed that many camels and ships must pass out of my hands. They were taken from me and are now held by certain wise men for sale to others. What will become of them no man knoweth, for many of the camels are strained and footsore from heavy burdens which they have been carrying.

> **"And they valued the camels and equipment; and behold, they found that many of the camels were old and their present value very small, and they knew naught of good will and cost of establishing the business. And the tolls which they fixed were grievously low."**
>
> —*L. R. Nash.*

"Because of this breaking up of my business I found there was no gain from what was left. When the matter of greater tolls was laid before the board of Elders they called together many people to determine what should be done, and a certain Scribe, who had often ridden upon camels, stood forth and proclaimed that there was much waste and mismanagement, yea, that many shekels per day were being lost which might otherwise enrich the carriers. And the Elders gave heed thereto and bade me set my affairs in order and profit thereby. Behold, therefore, the gains and the five talents which were thine have been swallowed up. And the end is not yet."

The rich man was sorrowful, but said, "Surely my other servants have not been entangled by this new and strange doctrine." And he called for him who had received two talents, receiving from him the following account of his stewardship:

"Lord, thou deliveredst unto me two talents with which to trade and bring thee just gains. As I went about the city seeking where I might find opportunities, I saw many water bearers going about the streets with their vessels of water. And they came from many wells outside the gates, selling to whomsoever would buy throughout the city. Thy servant saw that there would be much saving if all people were served regularly by the same bearers from near-by wells. I, therefore, bought many wells and hired the water bearers to go each through certain streets and was soon supplying the whole city with water. And because of the new plan of supply and delivery the gains from the business increased many fold.

"And it came to pass that certain Elders gathered together and reasoned among themselves, saying, 'What manner of man is this that causeth water to be borne to us and by what right doth he use our streets with his bearers?' The scrolls of the city were brought forth, and it was found that the rights granted to many of the old bearers had expired. And the Elders rose up and declared that the streets should not be used without a new writ which should protect the rights of the people. It was thought just that the city should receive half the profits of the business for the right to use its streets. Because there was much property which could not be used for other purposes, and lest there might still be too much gain left, it was decided

> **" 'And thy servant was afraid and went and digged in the earth and hid thy talent. Lo, here thou hast that is thine.'**
> **"And the rich man rose up and fell upon his servant's neck and wept aloud, for, though he had thought himself poor, he was still rich. And he made this servant ruler over all his house and his possessions."**
>
> —*L. R. Nash.*

that the city might safely require more than an equal share, perchance 5 per cent more. Now this agreement, which the people approved with great joy and which I had to accept or lose my all, was called a Franchise.

"And a mighty famine arose in the land and no rain fell upon the earth for many days. When the wells became low I ordered the bearers to charge more for water so that there might be less waste and the wells be not emptied. But the city decreed that this should not be, no such provision being in the franchise. So freely did the people continue to demand water that the wells soon became quite empty, and the bearers had naught to sell. Then rose up those in authority and cried, 'Where is this fellow whom we allow to supply us with water. What matters it if no rain falls in our midst and his wells are dry. He is our servant and there is water somewhere in the earth. Let him go forth and dig until he finds it, so that all may drink. We care not what the cost may be, and will cheerfully give up our share of profits, if necessary, until the rain falls again.' And in fear I went forth with many diggers and found a little water here and there many cubits deep in the parched earth. But this did not satisfy the people, who drove me forth again with many men and asses to the distant mountains where some water was found and borne with great labor to the city. Before the rain came again to fill the empty wells all my gains and more had been swallowed up, but being a servant of the people I was required to keep on.

"With plenty of water I began to make up my grievous losses when, behold, there appeared before me one day certain of my bearers and others whom I knew not. The latter declared that they had journeyed far to aid the bearers in gathering themselves together into a band which would consider with me certain grievances and arrange better conditions. I told the strangers that I know them not, and, as for the bearers, any one of them could bring his troubles to me at any time. They replied that henceforth I must deal with all together through their leaders, and that they required less burdensome labor and greater hire; that for many years they had borne the heat and burdens of the day for one penny, but henceforth their wages must be doubled. In vain I pleaded misfortunes and debts. They would work no more at the old wage.

"I went into the marketplace and hired other bearers, but they were stoned and beaten in the streets and became afraid. And when the people received no water they rose up and declared that under my franchise they must be served and demanded that the differences with the bearers be adjusted by public hearing.

"To the board of Elders appointed for the purpose the bearers told their story of poverty, long and patient labor and oppression, and the Elders listened not to my tale of fair treatment and wages and the many men standing all day idle in the marketplace willing to work at the wage I offered, but with no man to hire them. They ordered me to pay the hire demanded even though the business did not yield enough to meet the increasing burdens which had been laid upon it.

"Behold, therefore, thy two talents have been taken by the people and their hirelings, and naught remains but an unprofitable business which must be continued and which no man will buy from me."

And the rich man was exceeding grieved and cast down, his possessions being taken from him under laws he knew not of. Afraid to hear more from his servants, and believing that all was lost, he shut himself in his house to mourn his losses in anguish of spirit.

On the morrow there came unto him the third servant who had received one talent; and when his lord saw him he lifted up his voice and cried: "Tell me not of other statutes and devices whereby this my last talent which I gave into thy hand has been taken away. I can bear its loss, although it is all I had left of my worldly goods, but I can hear no more of devious ways by which I have been despoiled. Spare my thy tale of woe and leave me to my wretchedness."

But the servant tarried and finally spake in this wise:

"Lord, my fathers were numbered among the seers and prophets of their day and generation, and some threads of their mantle have fallen upon me. While I was busy with thy affairs under thy guidance in other years, I heard rumors and murmurings of discontent, tales of poverty, oppression and extortion by the rich. When thou gavest me the talent and took thy journey I saw the handwriting on the wall, saw that people would rise up and demand each his equal share of the world's goods, saw coming confiscation, excessive taxation and oppression of the rich. And thy servant was afraid and went and digged in the earth and hid thy talent. Lo, here thou has that is thine."

And the rich man rose up and fell upon his servant's neck and wept aloud, for, though he had thought himself poor, he was still rich. And he made this servant ruler over all his house and his possessions. Verily now it is written: "Lay not up for yourselves treasures upon earth, for from every one that hath shall be taken away and given unto him that hath not, and he shall have abundance."

PUBLIC UTILITY REGULATION—A CLOUD ON THE HORIZON

By H. H. CROWELL

President Michigan Railway, Grand Rapids, Mich.

WE are beginning to realize that our public utilities should be operated on a plan that is adequate to the continuously growing needs of our communities, that these utilities should develop normally, that the price for the service they render should be reasonable and fair, and that those who furnish the service and those who use the service should receive equal justice. It is quite generally admitted that the speculative, competitive days are practically ended, that destructive competition is economically unsound, that non-regulation of *de facto* local monopolies is unreasonable, and that, in lieu thereof, a trial period of commission regulation is begun.

It has, of course, been generally understood for many years by the furnishers of gas, electric and transportation service that such service was affected with a public interest, but this fact has usually been ignored by the operators and owners of public utilities and likewise, to a considerable extent, neglected by the authorities in so far as the regulation of rates and service was concerned.

Public service commissions have been created in forty-three or more states, and the several legislatures therein have duly delegated to these commissions broad regulating powers over public service corporations coming under their jurisdiction in the matters of rates, capitalization and service. In other words, it appears that the state has practically served notice upon the public service corporations that they must from now on submit to detailed supervision over their operations, that they will be required adequately to serve the public and that they will be permitted to earn, from the commission's viewpoint, but a reasonable rate of return or profit from operations for rendering the service.

During the early speculative period in the development of the public service business, opportunity was had for great success or absolute failure. During this period commercial warfare prevailed to a degree, and the far-sighted and forehanded pioneers who were successful and avoided failure in those trying times really laid the foundation for the present wonderful development in transportation, and in gas and electricity supply. The public now uses and enjoys these highly developed facilities, and the public should freely acknowledge its indebtedness therefor, the present status having been reached at a much earlier date under so-called destructive, non-regulated competition than would have been possible under any other plan.

It is possible, and quite probable, that in many cases the more astute operators were well rewarded for the labor they performed, the risks they took and the service they furnished. The rates of charge were unregulated and were generally based on what the traffic would bear, and the costs of operation were not swelled by constant effort to improve and better the service beyond an average efficiency. However, all the property and property rights created, brought into use and now existing as the net result of past operations, legally and morally belong to the corporations now serving, and such property, under the new plan or scheme of operations, is entitled to fair and just consideration by the regulating powers.

The situation at present facing the public service corporation may be summarized as follows: The rate of return from operations from now on is to be regulated; the profits to be taken from the business are to be fair but not over-large, and the service rendered must be satisfactory to the general public.

This notice to the operators of a limited rate of return is short, sharp and severe and, recognizing the laws of commerce governing the employment of capital, there should be and must be a period of adjustment. Operations must be continued, extensions must be made to satisfy the never-ceasing demands for a better and more adequate service, and, therefore, new capital must be furnished, and the public service corporations must procure this new capital on a basis different from that on which capital was formerly secured, when profits were limited only by the skill of the management and its ability to withstand competition.

It must be admitted that, concurrent with this notion of regulation, in some places there has arisen a clamor that the service in the past has been poor and unsatisfactory, that the obligations resting upon the corporations have been ignored, that excessive profits have been squeezed out of the public by exorbitant rates, and there is prevalent an undercurrent of feeling looking toward a recovery, a spirit of retaliation, a desire to "get even," and the vociferous advocate of the "get-it-back" theory is frequently welcomed and applauded.

Public service commissions which fully grasp the significance of the problems to be solved by them in regulating these public service corporations, will realize that it is more important for a community to be furnished with an adequate and satisfactory service than that there should be a general reduction in the rates of charge for the service. Right here let us call particular attention to this matter of good service. Safe and expeditious transportation, an ample supply of high quality gas, and an ade-

"The 'cloud on the horizon' is that there is imminent danger of partial confiscation of property on account of mixed reasoning of courts and commissions and inadequate presentation of the case by the corporation."
—*H. H. Crowell.*

quate, well-regulated system of electrical distribution of energy for power and light are now considered necessities in the daily life of every municipality. Why does a municipality grant franchises? A franchise is granted because the municipality desires and expects to receive satisfactory and adequate service from the grantee. That is the reason and purpose of the grant. All artificial and unnecessary burdens should be carefully eliminated from such grants in order that the best service may be had at least cost under prevailing conditions.

The public desire is practically lost sight of and there is an ever-present opportunity to defeat it in the attempt to punish corporations, to hold them down, to hamper their activities and to reduce their rates, thus killing every incentive to give good service, to better the property and enlist more capital.

The first important duty of all public service commissions is to use their every effort toward the building up and betterment of the service rendered by public service corporations. When this has been accomplished and sufficient data have been gathered to give the commissions an accurate understanding of all the costs and the circumstances under which the service is furnished, then and not till then will it be time to move toward a general reduction in rates, if it appears that there is inordinate return from rendering the best service which the state of the art permits and which the public demands. It goes without saying that the time will never come when it would be practical or judicious to reduce rates to such a point that there no longer would be incentive to work for economies or improvements. Public service commissions will fail and "regulation" will fail unless good service is given and the corporations are permitted to make sufficient gains from operation to enlist the employment of the large amounts of additional capital that are immediately needed to make the extensions presently demanded by the communities served.

Public service commissions, when called upon to fix the rates of a public service corporation, are required to determine the amount on which the corporation is entitled to earn a fair return, the fair rate of return under all the circumstances of a given case and also the rate or rates of charge that will enable the corporation to earn such return. The commissions, in such proceedings, are required by court decisions to value the property of a corporation which is rendering the service before fixing the rate of return and rates of charge, and a crucial test of a commission's worth is its ability equitably to fix a present fair value of the property of a public service corporation. This ability to determine values is a strong indication of the usefulness of the commission to the public at large.

There are several theories of valuation, or rather, several methods for arriving at the value of the property of a public service corporation. There is some confusion and necessarily some experimentation in undertaking to determine what is meant by "value" of a public service property. The courts have decided that it is the present fair value of the property of the corporation which must be found, and the courts have indicated what kind of value shall be taken into consideration when arriving at present fair value, but there is no definite mandate as to the weight to be given to each kind of value which finally determines present fair value.

It must be conceded that the property of a public service corporation is private property owned by its stockholders, and should be treated as such up to the point of excessive rates of charge or exorbitant return from operations. In determining present fair value, commissions usually consider original-cost theory of value, continuous-property theory of value, reproduction-cost-new theory of value, and, in part, cost-of-duplicating-the-service theory of value. Each one of these theories furnishes something of worth to the regulating body, either from an ethical or an economic viewpoint, that is of use in determining present fair value. On account of the difficulty of ascertaining original cost, due to the fact that there has been no uniform system of accounting and that the plants have been built piecemeal under various managements, it is exceedingly difficult to obtain a true concept of original cost, and commissions are giving greater weight to the reproduction-cost-new theory of value, modified or guided by such information in regard to original cost as will be helpful.

The tangible property includes structurals at reasonable unit prices for labor and material plus certain legitimately related overhead construction expenses, such as engineering and contingencies, administration, interest and taxes and general contractor's profit. The intangible property includes sacrifices made or incurred in connection with promoting the enterprise, creating the tangible property proper and such values as have accrued or accumulated by reason of undistributed profits or equities earned into the business previous to the period of regulation.

Regarding these intangibles, it is a fact but little known to those who have had no actual experience in the financing and constructing of public utilities that, under the accounting methods practised in the past, but a small portion of the expenditures necessarily made in promoting and establishing public service corporations ever appeared in the corporate books of account. Practically all of the expenditures necessarily incurred, in addition to those expenditures directly related to the physical and structural plant, were represented by certain forms of junior securities and, as capitalization is given but little weight by commissions in rate-fixing proceedings, there is an apparent lack of direct evidence as to the amount and value of such costs and expenditures, and they are many times presented in rate-fixing proceedings in such an indefinite manner as to raise in the minds of investigators a grave doubt as to their actual existence.

The time and expenses of administrators, engineers, lawyers and promoters were devoted to the promotion and creation of the plant and business of the public service corporation. Locations, housings, apparatus and equipment, rights-of-way and distribution systems are not to be had without general supervision. There is need for administrative and executive ability of various kinds for the promotion of the general proposition as distinct from the overhead costs directly relating to construction, and the value or cost of this general supervision generally appears only in the intangibles. Intangible property values are much involved. There are difficulties in arriving at definite standards and in many cases indirect methods must be used properly to determine them.

A list of the principal items of value, generally classed as intangibles, which must be included in the sum total value, will include outgoes consequent upon the acquisition of real estate, plant construction and supervision of the general contractor; also costs in reference to promotion, preliminary general corporate and executive expenses, the securing of state and municipal consents and the development of plant and business, the cost of financing, the going costs during construction and deficits from operations until the time when profitable operations were begun. All these and more should be carefully weighed and determined if the corporation is to receive full credit for past sacrifices made and values accrued in creating the facility whose present fair value is sought.

After issue is joined in a rate-fixing proceeding before a public service commission, under the usual conditions it is but a short time before the burden of proof is shifted from the complainant to the public service corporation, which corporation must then show affirmatively the value of the property it may include and the amount on which a rate of return may be earned; further, that its operating expenses are normal, that its revenues from operations are reasonable and that the per cent rate of return on the property included is not excessive. The complainant is generally not called upon to make a case. On the contrary, the commission will require the company to construct a complete defense to the complaint of unfair rate of return or excessive rates of charge.

It is exceedingly difficult for the corporation, in affirming the value of its property, to demonstrate the full value of its intangibles, and the "cloud on the horizon" is that there is imminent danger of partial confiscation of property on account of mixed reasoning of courts and commissions and inadequate presentation of the case by the corporation. There is generally too much stress laid upon reproduction-cost-new value and too small an allowance made for overhead percentages; there is a general tendency on the part of commissions to eliminate going value and cost of developing the business. There is great difficulty in creating a proper conception of earned or accrued intangible values. The present status of the property, its present value as a going concern and its ability to serve its public economically and adequately is due to, and is the net result of, the trials and operations of the past, the records of which in most cases have never been written. All existing values, tangible and intangible, are the product of past expenditures or past gains from profitable operations as yet undistributed. Full credit should, therefore, be given to all existing property values that may be found and there should be no consideration given to the clamor that certain existing values should be eliminated or ignored, under the theory that they were secured through exorbitant rates of charge, it being clearly shown that there was no regulation of rates in the past and that the public service business then was unregulated and competitive and that the fittest survived. The corporation's claims for intangible values are constantly discounted and the present fair values, as found by commissions, are approaching nearer and nearer to the "bare-bones" value of the plant, and thus partial confiscation is being practised under the guise of regulation.

"This 'cloud on the horizon', * * * will go on if the present tendency to give excessive weight to the reproduction-cost-new theory of valuation continues, unless the corporations more adequately present their side of the case and more conclusively present their claims for intangibles in rate-fixing controversies."

—H. H. Crowell.

The salient facts are these: Public utilities are promoted and there is always direct need for a legal, administrative and technical organization from the first move toward the establishment of the utility to the end of the construction period. The corporation exists, past rates were legal and competitive, the profits were the remainder after operations, which remainder, if any, was partly undistributed and was used for betterments or extensions, and such property, so obtained, must now be duly considered if used to render a needed service.

The best way to arrive at truth is to examine things as they really are, with an open mind, uncolored by fancy. In rate-fixing proceedings, the determining of a reproduction-cost-new value is dependent upon opinion testimony offered by both parties to the controversy. Lately there have ap-

> **"In order to get a square deal from the general public, the public service corporation must let the people it serves know the cost and requirements of good service. * * * In the long run a well-informed public is the safer friend to depend upon."**
>
> —*H. H. Crowell.*

peared a number of self-styled experts who are offering their services for a price for the purpose of assisting the users of any public service to get a lower rate for such service—never to get a just rate. These self-styled experts, admitting their total inexperience in the business of financing, constructing or operating public utilities, will qualify as expert witnesses, engineers and appraisers before commissions and, with a maximum of assurance and a minimum of practical information, swear to values on physical plants which are but a fraction of the existing values based upon any rational theory of value. Then they further unconscionably reduce these values to their lowest terms by the application of some theoretical rule of depreciation. Next, they calmly proceed to lumber up the record with their fanciful ideas as to why this or that intangible value in the property should be neglected or excluded in fixing value as a basis for rates. The commissions are not bound by rules of evidence as to the admission of testimony, and scores of pages of irrelevant, immaterial and incompetent matter dealing with specious theories of social justice, fanciful ethics and economic fallacies are offered by these self-styled experts, making "confusion worse confounded." The testimony of this type of witness apparently weighs as heavily with commissions and referees as does the testimony of duly qualified witnesses called in rebuttal by the public service corporation whose affairs are being investigated. These self-styled experts, practically immune from indictment for perjury, and generally in no danger of suffering in the public esteem even when their testimony is in fact misleading and worthless, place no limit on their tortured estimates of the value of public service corporation property or business. Their veracity has not been formally impeached, they are treated leniently by the public service commissions, and many times are taken seriously and considered as being more reliable and capable than are the witnesses offered by the corporation itself.

Public service corporations have generally failed in the full presentation of their cases in rate-fixing proceedings before public service commissions. Their engineer witnesses are sound and exact in their testimony as to structural values, but a knowledge of the technique of the business does not necessarily presuppose a knowledge of the ethical and economic principles involved. The engineer witness, employed by the corporation on account of his familiarity with the business, lacks the sophistry and plausibility of the self-styled expert whose chief business is to testify as his employer desires (in fact, this is his chief reason for being, and his financial prosperity depends thereon) and to assist with all his ability in the attempt to lower the rates without regard to the ultimate effect on the community or the corporation rendering the service. It appears that witnesses who are thoroughly grounded in material facts regarding structural values and costs of operation are seriously handicapped when they undertake to present overhead theories of value, theories relating to overhead expenses or theories of intangible values. The self-styled experts enlisted in the cause of the complainant, however, can on demand glibly discourse on such matters to the great disadvantage of the corporation. It will make for greater justice and equity for all concerned when these self-styled experts are properly weighed and labeled in the records of every commission before which they appear.

This "cloud on the horizon," this ignoring of intangible values, this partial confiscation of values earned into the property from past operations, will go on if the present tendency to give excessive weight to the reproduction-cost-new theory of valuation continues, unless the corporations more adequately present their side of the case and more conclusively present their claims for intangibles in the rate-fixing controversies that will arise continually from now on. A public service corporation, through its representatives or attorneys, has a perfect right and it is its proper duty to appear openly and frequently before the public service commission in opposition to movements against its interests, and also to propose action that will benefit the company and the community it serves. The corporation does not perform its full duty to its patrons, creditors or owners unless it does so appear and unless it does make needful representations. Every right-minded regulating body will welcome such appearances and suggestions as to service and standards of practice, for, in the end, it is not the public service commission that furnishes the service. The commission must depend upon the management for this and can issue orders if the management does not fulfil its obligations. The majority of the commission personnel are sensible and intelligent enough to separate wheat from chaff, provided the wheat is properly presented to them.

The question is sometimes asked: "Will good service and reasonable rates relieve a public service corporation from serious attack?" The answer must be "No." Good service and reasonable rates will not carry immunity from attack because of the political demagogue who finds an easy road to travel to office when riding a public service corporation.

In order to get a square deal from public service commissions, the public service corporation must make honest, intelligent and persistent effort before them and establish the fact with a commission that it is giving adequate service at reasonable rates.

In order to get a square deal from the general public, the public service corporation must let the people it serves know the cost and requirements of good service, the progress continually being made, the extensions continually going on, the perfection and improvement of its facilities and the reasonableness and equity of its rates and charges.

Public service corporations must frankly acknowledge the obligations of their charters and franchises, that the interests of the public are first, that compensation for service and profit from operations are in the hands of the public or its duly delegated representatives. The public, when rightly informed, will be free to admit, if it accepts the service offered, that it must pay a price commensurate with its value. In the long run a well-informed public is the safer friend to depend upon. Public service corporations go into partnership with the public, and as one thrives so thrives the other. The future credit of the public service corporation and its ability to obtain money for future additions and betterments is contingent upon the protection of its property from political demagogues and from vicious misrepresentation.

Unless this "cloud on the horizon" is dissipated, unless this tendency toward partial confiscation in rate fixing proceedings is curbed and full consideration is given to the intangible values existing in public service corporation properties, and unless the reproduction-cost-new theory of value is supplemented by some element of ethical value, thus promoting substantial equity, then this "cloud" will develop into a storm of financial trouble, disastrous alike to the public service corporations and to the public at large.

ELECTRICAL RAILROADING IN UTAH

By SIMON BAMBERGER

President Salt Lake & Ogden Railway

THERE is nothing of especial encouragement to be written from the average inter-mountain state concerning electric railway development. While the progress in Utah is far beyond the average, it has been but slow.

After the lines are built there is no trouble about patronage. The public is quick to show its appreciation of cleaner travel and more frequent service. But difficulties are encountered in the promotion and construction of electric lines, nothwithstanding the rapid growth of Utah and surrounding states in wealth, population, agriculture and almost every kind of industrial enterprise.

The chief difficulties may be summed up as follows:

1. The keen antagonism of the Goulds and Harriman interests against the development of interurban lines renders it almost impossible to secure outside aid, and it is therefore necessary in the main to build electric roads with local capital.
2. Excessive freight rates are charged by trunk lines between manufacturing centers in the East and points west of the Rocky Mountains, on materials and machinery essential to the construction and operation of electric roads.
3. In many localities trunk lines have built spurs which give infrequent and unsatisfactory service but with the evident aim and the actual result of discouraging the establishment of electric railways and dividing the traffic with those which might be constructed.
4. There is no public utility commission in Utah, although its creation would stimulate the extension of electric railways and other independent lines, as it would offer some protection to such roads when built.

Without some guarantee from the State that their rights are going to be respected and their interests safeguarded against political deals and unlawful combinations men hesitate to invest their capital. A public utilities commission in Utah would aid very materially in the development of her resources.

We have an abundance of water power generating electricity, more fuel than any state of the Union, mining districts and fertile valleys to be reached, produce to be taken from farms and ore to be taken to the smelters—every inducement for the establishment of electric roads, except the guarantee of fair treatment which the State should give.

"Without some guarantee from the State that their rights are going to be respected and their interests safeguarded against political deals and unlawful combinations men hesitate to invest their capital. A public utilities commission in Utah would aid very materially in the development of her resources."

—*Simon Bamberger.*

In this and in other Western states where politics and business seem to mingle and big corporations are able to hold a balance of power, or where abrupt changes in management might follow partisan reversals, public ownership would not seem altogether practicable.

When this comes it will be after the bitterness of party warfare is diluted with deep-seated concern for the public welfare, which will obtain in the Eastern states long before it is felt here.

ELECTRIC RAILWAY SECURITIES AND FRANCHISE READJUSTMENTS

By ALBION E. LANG

Past President American Electric Railway Association

THE relations of the electric railway to the public are so many and varied that to discuss them adequately would require columns of printed matter. A subject of deep concern to many at the present time, however, is the one dealing with the proper treatment of already legally issued securities when the company's franchise expires or when some readjustment of contracts is made between the public authorities and the company. The alteration or the renewal of a franchise invariably involves the lowering of rates, or the assumption of burdens amounting financially to the same thing, and usually forces a readjustment of the outstanding securities. Some assert that the security holder has only himself to blame for being caught under such conditions; that a railway franchise at best is only a permit of limited tenure to use the streets, and that when this franchise expires or the authorities wish to change the terms of it in any way, the security holder must gracefully submit and take whatever is offered him. He knew, or he ought to have known when he acquired his stock or his bonds, that he was purchasing an interest in a hazardous business and that he would have no just cause for complaint if, at the end of the franchise term, the property should be sequestrated with the exception of the value represented by the material as scrap.

> **"Cities are entitled to receive the lowest rates of fare the company can give consistent with good service and future growth and development, but rates should be fixed under a just and fair valuation, calculated to produce exactly these results while at the same time preserving intact the capital already invested. * * * To adopt any other policy now would be not only unfair but also unwise, because it would put what ought to be a most stable business on a hazardous basis, with resulting high interest rates and retarded development."**
>
> —*Albion E. Lang.*

Others, on the contrary, assert that this was not the attitude which could properly be assumed by the investor from previous acts of the state. They fail to see why the property of an electric railway should rest on any more precarious a foundation, as far as its rights at the end of a franchise period are concerned, than that of other public utilities which operate under limited franchises, such as water works, gas and electric lighting plants and even steam railroads, all of which, to a greater or lesser extent, also use the public streets in the operation of their properties. Rate adjustments which have been made by the state with companies of these different kinds have been accompanied by fair treatment, and the investing public has been justified in the past in accepting this fact as an indication of what should follow in the case of electric railways. In general, then, it may be said that in the past this has been the accepted point of view when the securities of street railway companies have been offered by reputable bankers or bond dealers and were issued in due form, and this fact is attested by the low interest rate at which mortgage bonds of electric railway companies in the large cities have been sold.

It is fortunate for the country that this view has been accepted so widely by investors, for it has resulted in the development of our electric railways far beyond similar enterprises in foreign cities and thus has conferred vast benefits in equal measure upon both municipalities and individual citizens. The growth of the communities in particular has been stimulated by the capital invested by the electric railways and the energy with which they have extended their lines to outlying districts. These facts should make a strong appeal to public officials and citizens to protect the electric railway capital investments within their communities. Any course that retards the development of these systems of any city will inevitably be reflected in the growth of the city itself and in its real estate values. No reputable newspaper or well-informed citizen should favor the reduction of rates or an increase in the burdens of an electric railway if the result will be an impairment of its service or development. Cities should receive the lowest rates of fare the company can give consistent with good service and future growth and development, but rates should be fixed under a just and fair valuation, calculated to produce exactly these results while at the same time preserving intact the capital already invested.

Such a policy has already been shown to be the only equitable one to pursue toward the security holders, because it is the one on which the securities were bought, and the city acquiesced in the plan and reaped the benefit of it. To adopt any other policy now would be not only unfair but also unwise, because it would put what ought to be a most stable business on a hazardous basis, with resulting high interest rates and retarded development.

TENDENCIES OF PUBLIC OWNERSHIP, ILLUSTRATED BY FEDERAL EXPERIENCE

By WILLIAM J. CLARK

Manager Traction Department General Electric Company

THE undertaking of business ventures by various forms of government has invariably come through representation to, and arguments made in and before, legislative bodies, to the effect that financial benefits would thus accrue to their respective communities, states or nations, and to the population of these bodies. Disillusion on these theories eventually comes through practical experience, usually too late, however, to remedy the political and economic mistakes thus made. This is because the first result from the inauguration of public ownership is an enormous increase in the total of government employees, as demonstrated wherever public ownership has been extensively undertaken.

What has already occurred in America as regards such increases, and how numerous those now in public employ are, few appreciate, but the "Official Register" of the United States for 1911, which lists those in federal employ for the year 1909, states as follows: "The growth of the 'Register' in size and number of names contained was approximately at the rate of 50 per cent in each decade previous to 1907."

The publication also shows that in the period of two years from 1907 to 1909 this increase was proportionately much greater, as it approximated 21 per cent. It also states that the number of federal employees in 1909 was 370,065. Hence, if the last rate of increase has continued in subsequent years, their total is at present more than 500,000, which is doubtless true.

From the census returns of 1910 it is evident the employees of the states and their minor divisions of civil government now also aggregate more than 500,000. Consequently, the total number of public employees of all kinds in this country is already more than 1,000,000, or approximately one for each fifteen votes cast in the last presidential election, the result of which was decided by a plurality of only 2,173,512.

If the ownership of railroads and other public utilities should be acquired by our various characters of government, an addition of more than 3,000,000 would be made to the total present number of public employees, and one would then exist for each four of our present voting population. What an opportunity would consequently be afforded for the unjust perpetuation of political power and repression of the will of the people not in government employ need not be elaborated, for it is obvious that under such conditions even the referendum would afford a powerful means of assistance to machine politicians in the attainment of their unworthy and dangerous ends.

So, if public ownership were universally adopted in this country, bringing with it the inevitable political situation just outlined, there would never be a departure from it, no matter how unfortunate its results were to the true interests of the country and its citizens.

Let us now turn to another inherent, fundamental feature incident to public ownership.

Unquestionably, that which basically causes and encourages the development of corruption, extravagance and inefficiency of every name and nature in such connection rests in the defects, inaccuracies and misrepresentations of public accounting, the foundation for which is laid by the methods followed in legislative procedure, which alone can bring public ownership in this country. The financial riders to general legislative acts and appropriations made under misleading titles, which are so common in all of our legislative bodies, force such a condition or at least are directly conducive thereto.

> **"The total number of public employees of of all kinds in this country is already more than 1,000,000, or approximately one for each fifteen votes cast in the last presidential election, the result of which was decided by a plurality of only 2,173,512."**
>
> —*William J. Clark.*

These statements can be verified by the citation of innumerable instances where their truth has been demonstrated by experience throughout the civilized world, and volumes could be written upon the details of undesirable resultants therefrom. Time and space, however, prevent the writer from now fully demonstrating this contention through citation of many well-established facts in such regard and force him to limit his efforts in so doing to a brief and only partial description of two situations of our federal government in this respect.

The lessons thus taught, however, will apply, in principle, at least, to any and all forms of public ownership, and they have a direct and important bearing upon what might result from the legislation now pending in Congress, which would provide for the public ownership of all electric railways that are located within or enter the District of Columbia.

"One town with a population of 799, whose post-office receipts are too small to be determined, has an authorization for a post-office building estimated to cost $48,125. Another, whose population is 741 and whose gross receipts are $6,158, has a like appropriation of $60,000. Another, whose population is 836, and whose gross post-office receipts are $5,684, has an appropriation of $50,000."

—*William J. Clark.*

Official publicity has never been given to the fact that federal buildings used for post-office purposes do not cast the slightest burden of investment, with its proper interest charges, upon the Post-office Department, nor does this department pay for the care and maintenance of these buildings. The accounting methods of the Post-office Department and the statements of its net financial results are, therefore, misleading to the extreme, as the investments and expenses just referred to are cared for by Congressional appropriations made to the Treasury Department, and from which no financial return is ever shown.

It is regretted that the combined total number of public buildings partially or entirely used for post-office purposes, and the extent of the financial obligations from which the Post-office Department is relieved by their existence, cannot be readily ascertained. Descriptive of this condition, however, Henry A. Castle, formerly auditor for the United States Post-office Department, has publicly stated as follows:

"The fallacy of calling our postal system self-sustaining, even if on the face of the books and on its present foundation it should fail to show a deficit at the close of some fiscal year, does not occur to casual observers, but it is recognized by all who study the subject. A railway company doing a business of nearly $1,000,000,000 a year, which was required to pay no interest on bonds or dividends on stock, would be a financial phenomenon. It is conceivable that the mail service might be so managed by a corporation as to yield satisfactory results and pay a small dividend, provided it performed no gratuitous services for the government as a condition of its existence. As now managed the Post-office Department has no 'plant' whatever. All it owns in the way of personal property is mail bags, mail locks, letter boxes, carriers' bags, and a few similar inconsequential items of equipment. Even in public buildings it is the tenant of the Treasury Department."

The invariable arguments urged in Congress for the construction of public buildings have, however, been that monetary savings would result to the government from their erection. An official statement of the present Postmaster General also defines the construction of these buildings as an extensive business undertaking. Consequently their erection can be considered as a government owned commercial proposition, from which results of like character have, in fundamental theory at least, been intended and expected, as well as elaborately pictured.

The report of the public buildings commission made to the present Congress throws much light upon true conditions in such regard, and the members of the commission are to be congratulated upon their efforts to eliminate the more serious economic evils, extravagances and incongruities existing in connection with this matter. The patriotic, disinterested stand of the Hon. A. S. Burleson, Postmaster General and a member of this commission, is especially commendable, for the continuance and expansion of the present methods of Congress on appropriations for public buildings would, as already indicated, so operate as to improve the fallacious net showing of his department.

The following directly appears in or is made apparent by the report of the commission:

"There has been authorized for public building sites and construction in twelve years, $163,085,431, an average of $13,590,452 per year."

"The public buildings act, approved March 4, 1913, authorized the expenditure of $41,797,350 for buildings and sites through the Treasury Department."

"In the construction, maintenance and operation of public buildings, the government has entered upon a great business enterprise. For the past three years the average expenditure for sites, construction of buildings, maintenance, operation and all other expenses, was $20,000,000 per year. Of this sum $2,706,754 represents the average expenditure for maintenance, and $3,495,686 represents the average expenditure for operation of buildings. In all of these figures no account is taken of interest on money invested." In subsequent calculations, however, the commission considers the rate of such interest as 3 per cent, which is unquestionably too low in view of the present tendency toward increase in the rates of interest throughout the world, caused principally by war conditions abroad.

"The only limitation now placed upon the authorization of public buildings is the requirement that buildings for post-office purposes only shall not be authorized where post-office receipts have not reached $10,000 per year."

While, as already remarked, a full list of buildings used or authorized for post-office purposes and the particulars in regard to them is not obtainable by the writer, 129 exceptions to, or violations of, the limitation just cited, are alone shown by tabulations contained in the commission's report, entitled: "Buildings Authorized Prior to 1913 but Not Acted on by Nov. 1, 1913." "New Buildings in 1913 Act." "New Sites and Buildings, 1913 Act." "Sites in Act of 1913."

These fall far short of enumerating all existing public buildings used for post-office purposes or which have been provided for. These tabulations, however, give 394 instances where the estimated cost of maintenance, with 3 per cent interest on the cost of public buildings, far exceeds the present rental paid for post-office accommodations in such locations, and in many instances this excess is several times greater than the present rentals paid.

The report remarks upon this feature, that the average rental of 508 post-offices having receipts of $10,000 or more, not now situated in government buildings, was $822, and it estimates the additional annual cost from locating them in government buildings at an average of $2,594 per post-office—this based upon an interest charge of only 3 per cent. Consequently, if this is done, an additional and not easily discoverable annual expense will be incurred by the government of $1,317,752, which would favorably increase by that amount the already fictitious financial showing of the Post-office Department.

The Postmaster General, in supplementing the report of the commission, states as follows:

"Public buildings have been authorized in the past for places where the needs of the government do not now and probably never will require such accommodations. Authorizations have been made for buildings costing more than $50,000 in places where the population is less than 1000. Such buildings would be large enough to house the entire population, and their authorization is indefensible.

"The interest of the government, therefore, requires that a building for post-office purposes only shall not be authorized for any place unless the rental paid for government offices is as much as $1,000 per annum, and then only when either the gross post-office receipts amount to as much as $15,000, or the population as much as 5000."

The tabulations contained in the report of the commission, and previously alluded to, show the following departures from the essentials to their justifiable erection, as defined by the Postmaster General.

Post-offices for which public buildings have or are to be provided, where the rental is less than $1,000........	374
Places where the population is less than 5000.........	319
Places where the gross receipts are less than $15,000...	288

As pointed out by the Postmaster General, such glaring inconsistencies and violation of all reason as these appear in the report of the commission: One town with a population of 799, whose post-office receipts are too small to be determined, has an authorization for a post-office building estimated to cost $48,125. Another, whose population is 741 and whose gross receipts are $6,158, has a like appropriation of $60,000. Another, whose population is 836 and whose gross post-office receipts are $5,684, has an appropriation of $50,000.

Contrasted with these conditions, as is generally known, there are comparatively large cities which have no government owned buildings or appropriations therefor, yet their gross post-office receipts are much greater than those of the offices mentioned.

Results from Federal Supervision of National Forests

Receipts	**$11,967,630.09**
Disbursements	**26,515.040.81**
Deficit*	**$14,547,401.72**

*Not including a total of $2,642,519.38 contributed to states and territories on account of the national forests.

—*Statistics compiled by William J. Clark.*

Great incongruities also exist in the relative cost of public buildings as fixed by congressional appropriations, for the Postmaster General shows such wide variations therein, as from an average of $5 to more than $21.50 per square foot of floor space, and on the estimated number of employees to be cared for ten years hence, ranging from approximately $1,000 to $5,000 each.

It is almost unnecessary to remark that the "Official Report" just quoted from, and the facts which it reveals, evidence the inherent general tendencies of and the results which come from public ownership, as already outlined herein; especially as regards the inaccuracies of government accounting and the easy conversion of expected economic benefits therefrom, into financial burdens which must be borne by the public at large.

TABLE COMPILED FROM OFFICIAL GOVERNMENT RECORDS SHOWING RESULTS FROM FEDERAL SUPERVISION OF NATIONAL FORESTS.

Receipts.	Total Seven Years, 1906 to 1912 inclusive.
Timber sales................................	$5,095,821.91
Timber settlement............................	209,366.83
Timber trespass..............................	319,152.04
Grazing	6,242,279.57
Grazing trespass.............................	22,862.14
Special use..................................	281,603.28
Fire trespass................................	40,593.98
Water power..................................	50,562.98
Total	$12,262,242.73
Refunds	294,612.64
Actual receipts..............................	11,967,630.09
Amounts paid states and territories for roads and schools....................................	$2,606,431.63
Amounts paid Arizona and New Mexico for school fund..................................	36,087.75
Disbursements.	
Salaries	$11,711,486.54
Travel	729,711.14
Rent	189,704.38
Supplies and equipment.......................	460,056.30
Other general expenses.......................	1,737,253.33
Total administration and use.................	$14,828,211.69
Improvement	2,546,551.45
Fire	1,481,160.31
Total on national forests....................	$18,855,923.45
Administration, supervision, inspection, etc., properly chargeable as national forest cost..	$5,491,160.22
Forest investigations........................	2,167,957.14
Total for forest service work................	$26,515,040.81
Actual receipts as above.....................	11,967,630.09
Deficit, not including a total of $2,642,519.38 contributed to states and territories on account of the national forests................	$14,547,410.72

In recent years, both before the public and in the halls of Congress, probably no feature of federal government ownership, other than the Panama Canal, has been so thoroughly discussed or claimed to be of greater immediate economic benefit to the nation as a whole than our national forests.

Resulting therefrom has come a material increase in the number of federal employees.

Whether or not federal accounting in connection therewith reveals all expenses thus incurred is not determinable, but the table on the previous page, prepared from official government records, shows what in accordance therewith have been the recent financial results secured from our national forests.

The two amounts last mentioned have, of course, been paid for out of the general funds of the federal government that had been raised by taxation of some name or nature.

Obviously the undesirable net financial results thus shown need not be elaborated other than perhaps to direct attention to the fact that the salaries directly paid in the service alone aggregate approximately the same amount as its total actual receipts; while in addition, it has cost more than 45 per cent of this amount to administer, supervise and inspect the service.

REGULATION FROM A COMMISSION VIEWPOINT

By WALTER A. SHAW

Commissioner, State Public Utility Commission of Illinois

THE Legislature of the State of Illinois which assembled Jan. 1, 1913, appointed a committee to make a thorough investigation of the laws passed by the various states creating public utilities commissions and the work of these various commissions. The committee, after a thorough investigation, reported in detail on the subject and recommended the passage of a law creating a state public utilities commission. This recommendation was concurred in, and such a law placed on the statute books of the State of Illinois.

The law as passed provided that it should go into effect on Jan. 1, 1914, and that the commission should be composed of five members to be named by the Governor. A few days prior to the day when the law went into effect, the present State Public Utilities Commission was appointed, and on Jan. 2, 1914, assembled and proceeded to organize for business and to carry out the duties imposed upon it. One of its first duties was to establish the nucleus of a working organization to carry out and put into effect the provisions of the law and also to provide an organization sufficient in size to take care of the immediate work and capable of being increased as the demands made upon the commission increased.

As was expected, the first eight months of the life of the commission have been hard, trying months, as the commission was starting with a new and untried organization and a new and untried law, and the demands made upon the commission were varied and many.

At the present time the commission has an efficient organization to cope with the duties imposed upon it, practically all of its work has been completed up to date, and it is in shape to take up promptly and intelligently all demands which are made upon it.

> **"I believed that the public, as a mass, is convinced that as an economic proposition, combination and consolidations of public utilities, if properly managed and governed, should be allowed and will result in a benefit to all."**
>
> —*Walter A. Shaw.*

The commission finds that during the last eight or ten years large combinations have been made, both as to capital and plants for the serving of municipalities and the public in the state of Illinois. The tendency with electric and steam roads, as well as with municipalities, has been to reorganize and arrange themselves into large units. For example, in the city of Chicago, not many years ago, there were several gas companies, several electric companies supplying energy and power, numerous street railway lines serving different sections of the city, and four distinct corporations and lines of elevated railroads acting independently of each other and under different managements. Within recent years, consolidations have been made and approved by the municipality, creating one gas company, one electric company and one unified street railway system, with a universal transfer system covering the entire city, and the elevated railroads are now operating under one management, and a passenger may ride for one fare to any part of Chicago to which the elevated roads extend. As to telephones, Chicago has been, I might say, fortunate in having practically but one system. In years past such cities and municipalities as Evanston, Oak Park, Blue Island, etc., which are suburbs and tributary to the city of Chicago, had independent plants for the furnishing of light, power, heat, transportation, etc. Now, we find that these various corporations and plants have been combined, and in the main, with the exception of transportation, are operated as one company.

Through the State of Illinois, in many localities and municipalities, holding companies have been formed and have purchased the plants in the various cities and localities, and what have heretofore been operated as individual plants are now operated as one unit, the tendency being to abandon many of the individual plants and to supply the energy, as far as possible and practicable, from one central plant, located at a point most advantageous for the serving of the surrounding cities and community. The theory of the combinations has been that great savings can be made in operating expenses, maintenance, etc., as well as great savings as to duplication of plants, distribution systems, appurtenances, etc., by the installation of larger and more economic units whereby the cost of production is greatly reduced. At least this has been the representation to the people, and, in general, the various governmental bodies having jurisdiction have accepted this theory, and have given permission for the forming of such combinations and consolidations. Theoretically, the statement is correct, as it necessarily follows that where there is a duplication of this kind, someone must pay, although temporarily, through competition, the people might obtain those commodities at a less cost; but if there is not a fair return upon a fair value, somebody eventually must lose, and if an analysis is made that somebody will be found to be the public.

I believe that the public, as a mass, is convinced that as an economic proposition, combination and consolidations of public utilities, if properly managed and governed, should be allowed and will result in a benefit to all. The question that now confronts the public is, how shall they be governed? Naturally, in one of two ways: either through the agency of the legislative bodies of the various municipalities or through the agency of the state through a properly organized public utilities commission, exercising the police power which is inherent in the state.

The police power, which is practically the only power for the regulation of utilities, as I have said before, is inherent in the State and remains so unless by an act of the Legislature a municipality has been authorized to make a special contract. Therefore, it naturally follows that the State has the direct power to regulate properly all utilities within the State whether they are owned by holding companies, single corporations or individuals. In the exercise of this power the rights of all parties interested, including the public, should be properly protected.

As between the party investing his capital and the party served, the law provides that capital invested shall receive a fair return for a fair value. Therefore, any state utilities commission, in treating with companies serving the public, must insist that the public shall receive sufficient and adequate service for a fair compensation based upon a fair value of the investment.

> **"Both the public utility corporations and the public ought to receive their legitimate shares in all reductions in the cost of manufacture and distribution of the output of the companies."**
>
> —*Walter A. Shaw.*

One of the first duties which a state public utilities commission owes to its citizens is to see that adequate service is rendered by the corporation serving the public. Hence some of the more important things with which a commission has to deal is the investigation of all legitimate complaints, the adoption of proper rules and regulations and the exercise of a proper supervision of the public utilities through the agency of a service department so that it will know that the utility companies carry out and live up to the rules and regulations adopted and that adequate service is rendered. The commission should also see that proper rates are charged for the service performed, and by this I mean rates which will return to the utility companies a net income, which, after the deduction of all legitimate charges, will be a fair return upon money invested.

These important acts in the regulation of utilities are undertaken by the state utilities commission in the states in which they exist. Where there are no commissions, this regulation is undertaken and performed by City Councils. In Illinois the commission may take up the subject of rates upon complaints filed by associations, individuals, City Councils, etc., or the subject may be taken up by the commission upon its own initiative. The adoption of a proper rate which will give fair return upon a fair value for the property used and needed by the company in serving the public is fixed after a complete investigation by competent experts. In addition to a fair return upon a fair value, the utility company should also be allowed to make its charges for services rendered sufficiently high to take care of maintenance, depreciation, obsolescence, etc.

In making a rate for a large city where the capital invested is large, it often happens that both the company and the city are represented by experts, and it sometimes happens—on account of past grievances between the municipality and the companies—that the object in view is lost sight of by both sides. The people have become prejudiced because of inadequate service given in the past, and in many instances exorbitant rates are charged. Often the utility companies have taken the position that they had a right to charge a rate based on an overcapitalization and to have a return upon a plant in which, for various reasons, the cost of construction has been excessive. In other words, they use all possible excuses to make the rate as high as possible, and they ignore the principle of a fair return based upon a fair value.

After a rate is finally fixed and determined, after thorough investigation and consideration, to be fair both to the public and the capital invested, the corporation may appeal from the findings of the commission. If the corporation honestly believes that it has not been treated fairly and that a fair return is not allowed upon a fair value, it cannot be blamed for resorting to the courts. But it ought to realize the interpretation which will be put upon such action by the public, namely, that it is an attempt on the part of the corporation to gain delay in putting in force a proper rate and the hope that the courts will legalize an exorbitant charge. The company should also take into consideration the tendency of the times, which is the regulation of public utilities by commissions rather than by competition, that regulation by commission is beneficial to the companies because it prevents a waste of capital and that the principle is one which the companies should support. Is not capital short-sighted when it resorts to tricks of law and other means at its command with the object of finally establishing a rate which is not just and reasonable?

If, in the future, the process of rate making by public utilities commissions is handicapped with expensive proceedings before commissions, if methods are employed by the investor that are unjust and unreasonable, and the adjusting of a rate is followed by long and continued fights in the courts, will not the people become disgusted and the method of governing utilities by commissions be a failure? And will it not be a fact that, as a natural consequence, municipal ownership will follow? At present, the people, as a mass, are inclined to believe that the attitude of the corporations before the public is unfair and has been unfair; that the prime object of the corporations is, and has been, to charge rates which are excessive, and that their purpose is to return dividends upon securities that represent little or no value. Why is this? I believe the reason is that in the past many corporations have been unreasonable in their attitude towards the public. Capital has not taken the people into its confidence to the extent that it should. It seems to me to be a fair proposition that the public is the principal and the utility corporation the servant.

Finally, the writer believes that both the public utility corporations and the public ought to receive their legitimate shares in all reductions in the cost of manufacture and distribution of the output of the companies, secured by economical management and by taking advantage of improvements in the art, in machinery, etc. The public can obtain the best results only when there is an inducement to the capital invested in these undertakings which supplies the incentive to maintain and keep the plants strictly up to date and to be continually on the alert to take advantage and adopt the most modern methods known to the art. Utility commissions of various states could well give this thought serious consideration, and possibly much good would result if the various commissions would interchange ideas on this subject.

THE EXPIRING FRANCHISE

By CALVERT TOWNLEY

Assistant to the President Westinghouse Electric & Manufacturing Company

Franchise. A particular privilege conferred by grant from a sovereign or a government and vesting in an individual or individuals a right or privilege conferred by a superior jurisdiction or government and not belonging of common right to the members of the public.—*Webster's Dictionary.*

A STREET railway cannot be operated without a franchise. A street railway is expected to continue in service indefinitely; therefore there never will come a time when its franchise may cease. But the public will neither trust the trolley companies with perpetual franchises, nor will the public trust themselves now to make terms which they are willing should endure beyond a limited term. They know that a franchise will be necessary perpetually, but they believe that only by granting it for a limited term will they be able, at its expiration, to impose on the street railway conditions more favorable to themselves and more onerous to the company than would be acceptable now. Now, confidence begets confidence and distrust engenders distrust. If the public will not trust the street railways it can hardly be expected that the street railways will trust the public.

If the street railway is to be deprived entirely of its power to earn money at the expiration of a fixed period on pain of submitting to unknown burdens at that time, the street railway will only be built now if its projectors can feel reasonably sure of getting their money back, and their profits as well, by the time the franchise expires. If a street railway could be constructed for a fixed sum and thereafter required no additional money, the amortization of its investment in any given period could, of course, be readily calculated. Under these circumstances an estimate could be made in the beginning as to whether there would be sufficient profits from operation to amortize and retire the capital investment at the maturity of the franchise. Unfortunately such is not the case. If anyone were to suggest that the public to-day could properly be served with the street railway construction and equipment common twenty or even ten years ago the proposer would be ridiculed, yet there are apparently many otherwise well-informed people who seem to think that the street railway of to-day will give sufficient and satisfactory service ten or twenty years hence. No one can claim accurately to forecast the future, but judging by the results of the past we shall be within the bounds of reason in saying that in twenty years it will be necessary at least to double the amount of money required to-day to construct an up-to-date street railway system, suitable to give sufficient and satisfactory service in the average American city. As the additional money will be needed in varying amounts from year to year any advance amortization calculation is put entirely out of the question. It might be possible to take sufficient money out of earnings annually to amortize the investment in fifty or forty or, may be, even in twenty-five years, provided no additional money is put into the enterprise. But if this is done, and it will have to be done from year to year if the property is kept up to date, the amortization period for this additional investment becomes shorter and shorter as the time for the expiration of a limited franchise approaches. The result is that toward the end of the franchise period the impossibility of amortizing any additional capital during the short period of life remaining in the franchise will prevent any additional investment in the business, and this will mean impaired service, a dissatisfied public, rows, recriminations, and all sorts of disagreeable occurrences. In the last analysis the blame for this condition cannot be placed on the railway, but squarely rests upon the shoulders of those who originally insisted upon an entirely uneconomical and unworkable term franchise.

The foregoing facts are by this time well known to almost everybody, and the vital question is: What workable arrangement can be made?

I take it that the controlling necessity is suitable transportation facilities. In view of the present public temper it is probably futile to suggest a perpetual franchise. It is equally sure that unless investors believe they will get their money back they will not put it into street railway securities. There is a hazard to this business as there is to every business. In the past it has been developed with great rapidity because along with the hazard went the chance of a considerable profit. If we take away this chance of profit we remove one of the greatest incentives to street railway growth, and that means the retardation of all sorts of civic growth in the communities served by its railways, and no one wants to lose this distinctively American aid to the country's progress. It is easy to point out objections to either the perpetual or the fixed-term franchise. It is by no means so easy to propose a general plan which will avoid these difficulties and objections, but probably the plan which comes nearest to meeting most of the objections from either side is that of a franchise irrevocable for a liberal fixed term, and continuing thereafter under the same terms and conditions until renewed on terms mutually agreed upon or until the municipality elects to purchase the property at its then "fair value." If a municipality refuses to trust a company for longer than a limited term of years it must accept a like refusal on the company's part to trust the municipality. The bargain is made for a fixed term. If the company loses money or if it makes money it should stand the loss or be entitled to the profit, but both it and the municipality should be in the same free and independent positions as regards bargaining rights when a new franchise is to be negociated as when they first made the trade for the original franchise. There must be no duress. This is secured when the municipality is obligated to take the property at its fair value. There can be no honest objections and no commercial hazard in buying a business at its real worth. "Fair value" is a term already pretty clearly defined by the courts. Its meaning will almost certainly be more fully settled as time passes. Something must be left undetermined, and as no one desiring to buy or sell at an "unfair value" has any logical claim to consideration, why not trust the courts to say what really is fair? There is no agency having or likely to retain the confidence of all concerned to any greater degree.

> **"Probably the plan which comes nearest to meeting most of the objections from either side is that of a franchise irrevocable for a liberal fixed term, and continuing thereafter under the same terms and conditions until renewed on terms mutually agreed upon or until the municipality elects to purchase the property at its then 'fair value.'"**
>
> —*Calvert Townley.*

Something certainly must be done. It does no good to rail at the municipalities or to call the companies hard names. Neither franchises nor the much-needed money will be secured by this means.

No plan is perfect; and an obvious objection to the foregoing one is the fact that no one can foretell that capital will continue to be attracted to street railway investments during the next, say, fifty years, even if no additional burdens are imposed on the investor. Security selling is competitive, and it may very well be that the chances for larger returns will be so much better elsewhere that greater inducements than exist at present will have to be offered to secure capital for street railway additions and betterments. However, should that condition arise, those in command at the time will have to face the situation and show the commissions or other regulatory bodies that through increases in rates of fare or by some other means the necessary additional yield must be forthcoming.

CO-OPERATION AND HARMONY BETWEEN COMPANIES, COMMISSIONS AND PUBLIC

By TRAVIS H. WHITNEY

Secretary New York Public Service Commission, First District

IN 1907 the State of New York created two public service commissions for the regulation of gas and electric companies, railroads, street railroads and allied transportation companies. This, with the Wisconsin commission, marked the commencement of so-called strong commissions, that is to say, commissions with power to investigate, to hold hearings, to make orders and to approve franchises, leases and securities. Prior to that time there had been in existence a considerable number of state commissions with mere power to investigate and make recommendations to the companies but without power to make orders. Following the New York and Wisconsin precedents a number of states have since created similar commissions, until now practically every state in the union has a commission of one form or another. Representatives of the companies interposed strong objections to such legislation, alleging infringements of their constitutional rights and predicting constant interference with their internal affairs and disaster to their success if such commissions were created.

> **"One might almost say that the companies and the public have ceased to criticise each other because of the love of criticising a common enemy."**
>
> —*Travis H. Whitney.*

Although in the beginning there was active criticism, first by the companies which alleged a too close supervision by representatives of the public, and second, by the public that there was lack of sufficient supervision, one might almost say that the companies and the public have ceased to criticise each other because of the love of criticising a common enemy. Due to the great growth of public opinion and the change of attitude of the corporation officials towards the public the commissions are now the means of co-operation between the public and the companies, the value of which is recognized by both.

The Public Service Commission for the First District of New York has jurisdiction within the city of New York, and the commission for the Second District over the remainder of the State. The companies within the jurisdiction of the former, of which I can speak more particularly, do about 20 per cent of the entire business of the country within their respective fields. The exactions of the enormous population concentrated within this small area are constant and require prompt attention. The average state commission deals largely with freight rates and freight service. This commission has chiefly questions of the adequacy of passenger service on urban lines, street, elevated and subway. The receivership and reorganization of the largest street car system in the city, as well as the various gas and electric rate cases, have required the appraisal of approximately $300,000,000 worth of corporation property. Such appraisals have been detailed and thorough. The commission has continued its work to the best of its ability and the present indication is that the commissions are permanent institutions and that the forthcoming constitutional convention will include them as constitutional offices with a broad grant of power.

It is not my desire, however, to give any detailed review of the work of the commission, but in a very general way to indicate what is perhaps the most important future field of regulation work. Public service corporations are under the affirmative duty (imposed not only by statutory law but by the common law) of rendering adequate service at reasonable rates with safe and adequate equipment. To see that they complied with these duties the commission received the following general powers:

1. To order adequate service.
2. To order safe and proper equipment.
3. To order reasonable rates.
4. To prescribe uniform systems of accounts.
5. To require periodic and other reports.
6. To approve securities.
7. To approve franchises and leases.
8. To investigate.

The first three indicate the results expected by the public. The other powers are given as means to secure such results.

If the duty of rendering adequate service at reasonable rates with safe and proper equipment is to amount to anything standards must be established by superior public authority; such standards must be uniform for similar classes. In my opinion this constitutes the chief field for future regulatory work, namely, the establishment and necessary gradual modification of uniform standards, inspection and supervision to secure compliance and finally publicity to the resulting reports. Effective regulation is dependent upon faithful performance by the commissions of these duties.

The Interstate Commerce Commission long ago prescribed a uniform system of accounts for steam railroads. This is the basis for similar uniform systems of accounts for steam, electric and other public service corporations, modified for the various classes and sizes of corporations. The form of annual report prescribed by the Interstate Commerce Commission and based upon the uniform system of accounts has likewise been the basis for periodic reports required of other corporations. The First District commission has found it necessary to make various modifications in these systems and reports to meet the conditions within its jurisdiction. In the way of reports it requires annual, quarterly and monthly statements and, with respect to certain phases of operation, daily reports. Prompt and adequate publicity is given to such reports or to summaries thereof by the issuance of bulletins to the press and to individuals who are interested in having them.

If corporations of a similar class are required to keep their accounts in accordance with a uniform system and to make frequent reports, and if publicity is given to such reports there will be in the hands of prospective investors such adequate information with respect to the corporations in question that the market price of securities will be a true index to the real value of the property of such corporations. As a consequence the mere approval of the issuance of stocks and bonds becomes relatively unimportant, although the retention of such approval would seem to be wise in order to keep in the hands of the commission a further occasion for the checking or rechecking of the methods by which a company is complying with the requirements of the commission with respect to its accounts and property. For example, at the present time various corporations in New York City which have made additions to property are keeping the commission fully informed with respect to such work in order that the commission's engineers may examine work during its progress and pass upon the bills as they are paid. When such companies subsequently apply for approval of bonds to pay for such permanent additions the work of investigation will have already been done and the matter of approval is to that extent routine but nevertheless important.

If accounts are kept in a manner prescribed, including allowances for depreciation and other accounts so often neglected in the past, the operating men can more adequately maintain and operate their equipment and service. To aid in this, the commission has prescribed standards for such matters as fenders and wheelguards, ventilation, brakes and protection for employees of electrical companies. In the matter of equipment it requires companies to submit plans and specifications of rolling stock about to be purchased in order that suggestions of possible improvements may be made. Orders respecting electric railway service have been made in which continuing standards are attempted, that is to say, that cars must be run either to the physical maximum of the line or sufficient to have the seats equal the number of passengers within a limited period, such as ten or fifteen minutes.

"In my opinion, this constitutes the chief field for future regulatory work, namely, the establishment and necessary gradual modification of uniform standards, inspection and supervision to secure compliance and finally publicity to the resulting reports. Effective regulation is dependent upon faithful performance by the commissions of these duties."

—*Travis H. Whitney.*

In the beginning it was apparently the general idea that the commission was a great tribunal to redress every complaint that might be made. The very name "Public Service Commission" denoted a commission for the benefit of the "public service." One day a man came to the office to dictate and have typewritten his answers to certain inquiries he had received. He was indignant when a stenographer was not placed at his disposal, for as he said he understood that this was a "public service" commission.

Pertinent complaints are received and have a prompt hearing and disposition, but, after all, complaints, if well founded, arise from defects and deficiencies of equipment, operation or management. Complaints are sporadic and therefore do not furnish sufficient evidence for thorough improvement. Orders made only as the result of complaints are like new shingles in an old roof. Careful and patient study of conditions antecedent to the establishment of standards and compliance therewith produces a thoroughgoing improvement—a new roof with no opportunity for leaks.

Finally, nothing succeeds like publicity, telling the patrons of the difficulties, showing them the machinery by which service is rendered to them, asking their co-operation and improving conditions. One of the most important phases of present-day attitude is the readiness and anxiety that the public shall have full knowledge and shall understand. In my opinion the commissions have been of immense aid in securing this attitude, that is to say, the readiness of the commissions to be a tribunal for the disclosure and publicity of grievances has accelerated a desire to forestall the embarrassments of commission or even legislative investigation by a straightforward "appeal to the people." Much remains to be done in the way of more complete publicity by public service corporations for the benefit of investors, patrons and the public. But the period of co-operation and harmony as between the companies and the commission and the public has begun. The work of the commissions has been of immense aid in this and should not be hampered. Legislatures should not plan laws infringing on the powers of the commissions. The companies should not try to throttle the impartial and energetic attitude of the commissions.

PROPOSED CO-OPERATIVE ARRANGEMENT AT PHILADELPHIA

By A. MERRITT TAYLOR

Director Department of City Transit, City of Philadelphia

PROLONGED conferences between the Department of City Transit (city of Philadelphia) and the management of the Philadelphia Rapid Transit Company have resulted in the submission by the conferees of a program for rapid transit development with universal free transfers.

The salient features of the program are as follows:

The program provides for a total investment of approvimately $63,000,000 in the transit development, of which about $45,500,000 would be invested by the city in building the subway and elevated lines (which the city would own), about $12,000,000 would be provided by the Philadelphia Rapid Transit Company for the equipment of the municipally owned lines, and about $6,000,000 would be provided for the Rapid Transit Company by outside interests in constructing the Camden tube. The Philadelphia Rapid Transit Company, as operator, would be allowed to deduct from the earnings of the municipally-owned lines 6 per cent on the cost of the equipment supplied therefor, and, after ten years, an additional 1 per cent on the cost of equipment, which would be deposited in the fund to be accumulated toward the amortization of that cost, and that fund would be available to the city in paying for and taking over the equipment at the end of fifty years.

The company would also be protected to a reasonable extent against such decrease in the net income of the company-owned lines (except the Camden tube) as would result solely from the diversion of such normal net income as may have been gained by the company prior to the opening of the municipally-owned line or lines, by the preferential payment, the necessity for which it is calculated would be eliminated by the normal growth of the company's business within a few years after the opening of the municipally-owned high-speed lines.

From any preferential payment due to the company out of the earnings of the high-speed lines there would be deducted:

1. The net income resulting from the operation of the Camden tube.
2. The difference between the interest rate paid by the company and the amount allowed, namely, 6 per cent on operator's equipment investment.
3. The rental paid for the temporary use of the Market Street Subway-Elevated line, between Thirtieth and Market Streets and Front and Arch Streets, by the Frankford-Darby line, until the Chestnut Street Subway is required.

Subject to these prior deductions, the city would receive all interest and sinking fund payments accruing on the city's investment, before any further division of earnings would be made to the Philadelphia Rapid Transit Company.

Upon the city being paid its interest and sinking fund accruals on the city's investment in full, any remaining annual surplus resulting from the operation of the city-built lines would be divided between the city and the company in proportion to their relative investment therein (Market Street Subway investment excluded).

Thus the city gains the advantage of these items as credits on any preferential payments and also, in calculating the preferential which protects the company, gains the advantage of any economies or savings which the company is enabled to accomplish in engaging in this co-operative program.

> **"The program, as a whole, assures to the people of Philadelphia a splendid modern rapid transit system, operated in conjunction with the existing lines as one great unit, in a manner which will render the public the greatest service at a minimum reasonable cost."**
>
> —*A. Merritt Taylor.*

The program further provides for the operation of the existing and new transit facilities of the city as a unit, in such manner as will best serve the public, including the elimination of all exchange tickets; and further, for the issuing of free transfers wherever surface lines intersect high-speed lines (city's and company's—Camden tube excepted) at station points, and at all points of intersection between high-speed lines (Camden Tube excepted). The intent of this provision is to make all high-speed lines (city's and company's) available as a link in a complete journey in a forward direction between any two points within the city for one 5-cent fare.

All exchange tickets on the existing system would be eliminated outside of the district bounded by Arch and Walnut Streets (both inclusive) and the two rivers, on Jan. 1, 1916, after which one free transfer would be allowed outside of that district to each passenger using the company's surface lines at all points of intersection. On Jan. 1, 1920, the remaining exchange tickets would be eliminated, and one free transfer would be allowed to each passenger using the company's surface lines at all points of intersection within the city of Philadelphia.

Upon the elimination of all exchange tickets outside of the district bounded by Arch and Walnut Streets (both inclusive) and the two rivers, on Jan. 1, 1916, a passenger would be enabled to reach any point in that district by taking a line running east and west, either north of the district or south of the district, and by transferring free to the north and south line leading to the point in the delivery district which the passenger wishes to reach. The effect of this arrangement is to give the people a free transfer to the delivery district, subject only to such restrictions as are necessary to avoid the serious overloading of the east and west lines in the delivery district before the city has time to build the Subway Delivery Loop to relieve such congestion as would otherwise result.

In consideration of the elimination by the company of exchange tickets on the existing system and the substitution of free transfers therefor, as above provided, the city would agree to release the company from the payment of the tax now paid upon dividends of subsidiary company stocks, as provided by ordinance, in the amount of approximately $116,000 per annum for a period of six years only, or a total amount of approximately $696,000. The city would also surrender to the company the accrual in the sinking fund (established under the contract of 1907 between the city and company to amortize the company's capital stock) and permit the company to postpone future payments into the sinking fund for ten years from July 1, 1914. The sinking fund payments so surrendered and postponed are to be made up by such larger annual payments by the company, after the aforesaid ten years, as will be required to produce the same amount in the sinking fund at the expiration of the 1907 contract extended for seven years, as would, with interest included, have been produced by the original sinking fund payment at the end of the fifty-year term.

Thus the city pays only $696,000, as above stated, in consideration of the elimination of all exchange tickets and the issuance of free transfers at all points, as already described.

It is further provided that ultimately, when the Market Street Subway becomes overloaded (which will not be for many years) and when the city builds the Chestnut Street Subway at that time, or other delivery facilities or connections to the Frankford and Darby lines, or when the city builds any additional rapid transit lines or extensions, the city would have the right to require the company to equip and operate such lines on the basis prescribed.

The city would further have the right to require the company to extend its present surface system from time to time, as such extensions are reasonably justified.

> **"It provides that the city is to own the new facilities and all their future net earnings excepting such reasonable payments as are allowed the operator, including 6 per cent on operator's investment."**
>
> —*A. Merritt Taylor.*

In making the proposed extension of the present contract between the city and the company for seven years beyond the present term thereof, in order that longer term bonds may be issued by the company for its financing, the interests of the city are safeguarded by providing that after the present fifty-year term expires all surplus earnings on the stock of the Philadelphia Rapid Transit Company in excess of 6 per cent on the par value shall be turned over to the city.

Provision also has been made for both city and company to capitalize practically all of the interest and sinking fund payments accruing on their investments during construction and during the first year of operation, so that such payments would not be a burden to the taxpayers of Philadelphia. This is the method pursued in many great constructive enterprises, and provision therefor is made in the proposed amendment of the state constitution now in process of adoption.

In consideration of the Philadelphia Rapid Transit Company allowing the use of its present Market Street Subway-Elevated line for the through-routing of Frankford-Darby trains, the city would allow the company a rental out of the earnings of the high-speed line for the use of this subway-elevated line, but that rental would be limited to such proportion of the fixed charges accruing against that portion of the structure of the Philadelphia Rapid Transit Company which is used by the Frankford-Darby line as shall bear the same proportion to the whole fixed charge on that portion of such structure as the proportion of car miles operated by the Frankford-Darby trains through that portion of the subway bears to the car mileage of all trains operated through that portion of the subway. The fixed charge against the operation of that portion of the subway which is used for surface cars is not included in the calculation.

The 1907 contract between the city and the company provides that "The company shall not declare or pay any dividends to its stockholders beyond a return of 6 per cent per annum, cumulative from Jan. 1, 1907, on the actual amounts of capital paid into the treasury in cash, calculated from the date of the several payments, without at the same time appropriating from earnings and surplus and paying into the city treasury a sum equal to that portion of the total dividend which is in excess of the said 6 per cent return, so that the city shall share with the stockholders equally in all net earnings properly distributable as dividends over and beyond a return of 6 per cent per annum, cumulative

"The cost will be slight, and furthermore the cost will be more than completely and generously offset by the 1-mill tax on personal property which has been turned over by the State to the city as a practical subsidy in the aid of transit developments, by the great increase in property values and therefore in tax returns which will accrue to the city treasury, and by the cancellation of the present exchange ticket charge on the public of $800,000 per annum, which amount would have increased from year to year. * * * The city's growth will be accelerated. The efficiency of the population will be increased by time saved, which, capitalized on the basis of 15 cents per hour, would amount to upwards of $38,000,000."

—*A. Merritt Taylor.*

from Jan. 1, 1907, upon the paid-in capital stock of the company."

As the company has not paid any dividends on its stock since Jan. 1, 1907, and under the 1907 contract is entitled to 6 per cent dividends from that date, before sharing one-half of the profits with the city, a large amount of back dividends, amounting to about 42 per cent, or $12,000,000, would have to be paid to the Philadelphia Rapid Transit Company stockholders out of any future net income of the company, in addition to 6 per cent after this time on the par value of their stock, before the city could hope to have any return from the company's present system.

The program provides that all dividends accrued on the Philadelphia Rapid Transit stock, up to Dec. 31, 1914, shall be waived and cancelled, thereby cancelling what is equivalent to a $12,000,000 obligation of the Philadelphia Rapid Transit Company to its stockholders, which would otherwise have to be liquidated before the city could share in the profits above 6 per cent on the company's capital stock and which result from the company's own operations.

The program also provides that the Department of City Transit shall have free access at all times to the books, accounts and records of the company and the right to audit the same. This is in addition to the present provision in the 1907 contract, which gives the city comptroller the right to audit the company's books.

It is provided in the program that the Union Traction Company and the Market Street Elevated Passenger Railway Company will become parties to and be bound by the terms of the program.

It is contemplated that the company shall forthwith make such changes in its routes and lines as will enable it to take advantage of the economies which may be gained by the substitution of free transfers for exchange tickets. This means that such people as are now carried by indirect routes (which are so arranged for the protection of the company's exchange ticket business) will be carried more directly than heretofore to destination for 5 cents instead of for an 8-cent fare.

The Union Traction Company will be expected to aid in securing only such funds as will be required for the normal extension of the existing surface system, the requirements for which will be greatly lessened by the establishment of the new high-speed lines.

The program, as a whole, assures to the people of Philadelphia a splendid modern rapid transit system, operated in conjunction with the existing lines as one great unit, in a manner which will render the public the greatest service at a minimum reasonable cost.

It provides that the city is to own the new facilities and all their future net earnings excepting such reasonable payments as are allowed the operator, including 6 per cent on the operator's investment.

It assures to the city and the people the added prosperity and comfort which every such great constructive enterprise and added convenience brings; the cost will be slight, and furthermore the cost will be more than completely and generously offset by the 1-mill tax on personal property which has been turned over by the State to the city as a practical subsidy in the aid of transit development, by the great increase in property values and therefore in tax returns which will accrue to the city treasury, and by the cancellation of the present exchange ticket charge on the public of $800,000 per annum, which amount would have increased from year to year.

The indirect advantages must not be overlooked. Present and ever-increasing congestion will be eliminated. The city's growth will be accelerated. The efficiency of the population will be increased by time saved, which capitalized on the basis of 15 cents per hour at 5 per cent, would amount to upwards of $38,000,000. The city's areas available for development will be so enlarged as to make comfortable and economical homes readily available to all, and undue congestion of population will be prevented.

There has been a great world-wide awakening to the view that communities must collectively, for the good of all, undertake wider spheres of service, and that the community itself should retain, to a greater degree, the unearned increment in values which is created by the concentration of its own population and by its own activities. In Philadelphia there is an undoubted urgent need for additional and better transportation facilities. Private interests cannot handle this proposition without municipal aid. No one can reasonably doubt that the comprehensive transportation system proposed will in time develop ample direct earning capacity, not only to carry itself but actually to relieve taxation for other purposes.

PUBLIC VERSUS PRIVATE OWNERSHIP

By WILLIAM D. KERR

Director Bureau of Public Service Economics

THE function of a public utility is a public one.[1] The establishment of regulating commissions and the acceptance by public utilities of the principle of regulation give recognition to the public nature of the function. Commission regulation is an attempt to provide safeguards without which the performance of public duties could not be entrusted to private hands. Regulation is one of the alternatives so clearly set forth in the following language in the report of the National Civic Federation Commission on "Public Ownership and Operation":

"First, we wish to emphasize the fact that the public utilities studied are so constituted that it is impossible for them to be regulated by competition. Therefore they must be controlled and regulated by the government or they must be left to do as they please or they must be operated by the public. There is no other course. None of us is in favor of leaving them to their own will, and the question is whether it is better to regulate or to operate."

We make no secret of our belief in the ability of private organization and private capital to meet every fair test of approval in the contest with public ownership. The burden of proof, however, rests on private organization. Apparently this is an inevitable consequence of the responsibility that attaches to the possession of power. Philosophically and practically it must be conceded, however, that *prima facie* public functions should be discharged by the public and not by private organizations. In its attitude toward regulation, and particularly rate regulation, private organization has its most favorable opportunity to overcome this presumption.

An element of certainty has come into the regulation of public service rates which a decade ago did not exist. The uncertain or indefinite factors of the equation have been largely eliminated. To representatives of the public, at least, the economics in general of public utility services are known in all their manifold intricacies. This was not the case when regulation began to be practised on a large scale. It was not the case when the courts began their difficult struggle with legislative rights of interference and with principles of valuation. Practical limitations of knowledge and experience are fairly well understood regarding construction costs, operating expenses, depreciation requirements, service economics and margins of profit. In practical discussions the available data are not always used, or they are abused, but the foregoing statement applies to the representative public service commissions. Practically the sole factor of downright uncertainty in the whole situation is property and its value.

This uncertainty as to the limitations of value, as will later appear, seems an inevitable result of the very nature of that which is known as value. Not only, however, is this thing called value, for the protection of which the courts have thrown a mantle against legislative interference, a factor indefinite in itself, but with the clarification of the other factors in rate making it has become the residuary legatee of the animus engendered by the questioning of supposed vested rights. Value and the principles governing its determination are the fortifications before which promises to be fought the last great battle between public and private ownership.

> **"Value and the principles governing its determination are the fortifications before which promises to be fought the last great battle between public and private ownership."**
>
> —*William D. Kerr.*

The value of property employed by private agencies of public service is the most important limitation on legislative rate-fixing powers. Protected by the courts under constitutional limitations property is alike the citadel of entrenched monopoly and the *bête noir* of overzealous champions of supposed public rights. The resulting situation as presented in countless cases before administrative bodies and courts suggests one of these three conclusions:

1. Rules resulting in under-valuation throttle private initiative and leave the field to public ownership.
2. Rules resulting in over-valuation throttle legislative action, nullify regulation and encourage recourse to public ownership.
3. Fair rules of valuation impose on the public burdens not appreciably greater under all the circumstances and in the long run than would be experienced under public ownership.

The effect of under-valuation is self-evident. Neither flattery, nor cajolery, nor injunction of law will prevail to induce capital to enlist in a known losing cause. If the rules of value claimed in isolated cases were the established rules of the land,

---

[1] "A railroad is a public highway and none the less so because constructed and maintained through the agency of a corporation deriving its existence and powers from the state. Such a corporation was created for public purposes. It performs a function of the state." Smythe vs. Ames, 169 U. S. 466, 544. See also Snell vs. Clinton Electric Light Company, 196, Ill., 626; San Diego Water Company vs. San Diego, 118 Cal. 556.

"If the rules of value claimed in isolated cases were the established rules of the land, private building would stop instantly and a wild scramble would ensue to save as much as possible of existing investments. On the other hand it needs no argument to demonstrate that rules which effect overvaluation will lead speedily to public ownership. In no other way can the public protect itself."

—*William D. Kerr.*

private building would stop instantly and a wild scramble would ensue to save as much as possible of existing investments.[2]

On the other hand it needs no argument to demonstrate that rules which effect over-valuation will lead speedily to public ownership. In no other way can the public protect itself.[3]

The Supreme Court of the United States saved the country from the curse of immediate government ownership of railroads by discarding emphatically and completely the rule of railroad right-of-way and terminal land value advanced by the railroads and approved by the trial court in the Minnesota rate case.

Fair value is not value but equity. It is a reduction to a common denominator of all the multifarious, divergent and sometimes seemingly inconsistent factors entering into relations between the public and the private agencies. Value as an economic conception is a comparative measure of exchange worth. In rate regulation there is neither occasion for comparison nor effort to exchange. Application of the economic conception would defeat the purpose, as value depends on return and return depends on rates. Rate regulation presents not a hypothetical case for the application of abstract theories as to value but a practical case for the determination of fundamental equities. Every case must stand on its own feet and be decided on its merits. The extreme caution with which the Supreme Court has treated valuation questions raised in litigated cases would seem to indicate recognition by the Court that rules applicable alike to all cases do not exist. The only infallible rule is the one of equity and good conscience propounded by the learned Lord Mansfield. The determination of value that will enjoy permanence is the one that appeals to the reason, judgment and good conscience of the layman.

The contest between public and private ownership is not to be decided on "authority." Authority, as such, is no more infallible than the men who made it. It is characteristic of modern times to discard authority as such in all the realms of the mind—religious, economic, social and political. The administration of the law has suffered in the opinions of many by its too rigid adherence to authority. Progressivism, if it means anything at all, means conscious movement toward the highest known conception of justice. Any material deviation to one side or the other from a just conception of value under the circumstances of each particular case widens the breach between public and private ownership and hastens the progress of the former. Equity seeks the substance, not the form.

If these observations in a measure are correct they counsel recognition and application of the following definite policies:

1. Moderation and fairness in valuation claims made to commissions and courts. Immoderation tends to produce immoderation and not "judicial fairness."[4]

2. Excessive care on the part of commissions and courts to do equity according to the circumstances of cases as they arise.

3. Removal, certain even though gradual, by corporations on their own initiative, of causes, just or unjust, which lead to the supposed necessity of making extravagant claims of value when confronted by rate revision. This, it will soon be recognized, is a duty of management to stockholders second not even to the economical and efficient administration of the physical property.[5]

Finally, let it be observed that while natural economic laws conduce to monopoly in the supply of public services, there is no monopoly of agencies for the rendering of the services. Public ownership is everywhere a potential if not an actual competitor of private. The general administrative inefficiency of public ownership under normally existing conditions alone in most cases has sufficed to hold the balance for private ownership and may continue for some time to do so. Actual safety, however, lies only in the squaring of values with the fact. In this connection it is important to remember that individual establishments in the several industries are so related sentimentally in the public mind that unsatisfactory conditions found to exist in one establishment are likely to be attributed to all. The wise conduct of each is the concern of all.

The ultimate verdict lies with the public. The testimony on which strongest reliance is placed is the conduct of private corporate enterprises. The psychology of salesmanship forbids detraction of a competitor's wares and lays emphasis on convincing the customer of the essential merit of one's own goods. Private enterprise in the furnishing of public services has a product to sell composed of high efficiency and the economical combination in practice of the factors of production. To win and hold success, however, it must make buyers for its product to-day, to-morrow and every day.

---

[3] See report and attached papers, with discussions thereof, of committee on railroad taxes and plans for ascertaining fair valuation of railroad property of the National Association of Railway Commissioners in Proceedings of 1913 Convention, page 259 *et seq.*

[4] "It is my singular experience that in no case brought to my attention has the utility before the commission failed as a result of the activity of its sworn experts, to justify rates as high, and usually higher, than those which had voluntarily been accorded. Certainly this is a tribute to the generosity of those in charge of utilities beyond the generosity of the rest of us, and a demonstration that all expense and time expended in the regulation of monopolies is worse than wasted." Commissioner Eshleman in concurring opinion in Town of Antioch vs. Pacific Gas & Electric Company, Case No. 400, decided July 6, 1914, by Railroad Commission of California, page 55.

[5] See *Re* Capital Account of Brooklyn Borough Gas Company, V Reports of Decisions of the Public Service Commission, First District, New York, 203, in which an agreement was reached whereby a plan was placed in execution for amortizing the excess of the company's capitalization above the fair value of the property.

STOCK DIVIDENDS; WHY AND WHEN JUSTIFIED

By PHILANDER BETTS

Chief Engineer Board of Public Utility Commissioners of New Jersey

A DISCUSSION of this subject appears to be desirable, because of the applications which have been made for such approval by the public utility commissions. At the outset, it should be stated that the opinions here expressed have been formulated by the writer in his position as chief engineer of the New Jersey Public Utility Commission. They have, however, up to the present time met with the approval of the commission to such an extent that all actions so far taken have been along the lines herein discussed.

The desirability of discussing this subject at this time is due to the fact that in the minds of many persons there appear to be two bases upon which such issues are justified. The first is the assumption that where moneys from earnings have been expended in connection with extensions and additions to the permanent plant of a company, the later capitalization of such extensions is justified up to the full cost of such extensions. This does not take into account the requirement that various items should be amortized from earnings. These items include bond discount, extraordinary organization expenses, most of the intangibles, accrued depreciation, etc.

The second basis on which stock dividends are justified is that a property now has a value in excess of the outstanding capitalization. This basis does take into account the amortization of all such items which ordinarily result in a situation where the outstanding capitalization exceeds the value of the property represented by it.

Up to the present time there have been before the New Jersey Commission seven applications for approvals of issues of stock for the purpose of distribution as dividends. Of these seven applications, two have not yet been acted on; one was disapproved, and four have been approved.

The first application which came before the commission was that of a gas company operating in southern New Jersey. The financial history of this company had been so well preserved that a complete analysis was readily made. This analysis is illustrative of the various elements which should be considered in passing upon the justification for the declaration by a company of a stock dividend.

This company built its plant in 1857 and furnishes gas exclusively entirely within a city having a population of about 19,000. The financial history shows that in the period from 1857 to 1870 the plant increased in value from $21,000 to $34,700, the average value during the period having been $22,730. During this period the dividends amounted to $14,230, or 4.9 per cent on the investment. In addition about $160 was invested in the plant from surplus earnings. This statement shows that on the basis of a 5 per cent return the cost of building up the business, including all deficits and lack of early profits, had been made up by the year 1870. Up to 1870 the capitalization of the plant kept pace with the actual cost of the plant.

Table I shows the amount of surplus earnings invested in the plant.

TABLE I—SHOWING SURPLUS EARNINGS INVESTED IN PLANT

Surplus earnings invested in plant, 1870.........	$169.35
Surplus earnings invested in plant, 1870-1875....	7,620.50
Surplus earnings invested in plant, 1875-1880....	9,083.97
Surplus earnings invested in plant, 1880-1882....	6,271.17
Surplus earnings invested in plant, 1882-1887....	6,080.84
Surplus earnings invested in plant, 1887-1892....	17,859.38
Surplus earnings invested in plant, 1892-1908....	95,037.32
Surplus earnings invested in plant, 1908-1912....	28,788.55
Total	$170,893.08

The par value of the capital stock outstanding in 1870 was $31,040, and no stock was issued from that time up to 1912. In 1870 there were loans outstanding to the value of $3,500, making a total capitalization in 1870 of $34,540. Standing for this, there was a plant which had cost $34,699.35.

Table II shows the cost of the plant at the beginning of each of the periods; the average cost of the plant during each period, which is also taken as the average capital invested in plant; the dividends paid during each period; the surplus earnings invested in the plant; the total net earnings during each period, and the ratio in percentage which the net earnings bore to the average value of the capital invested during each period, the average for the entire fifty-five years being 8.9 per cent.

Table III shows the dividends paid during each period, also the percentage which the amount bore to the capital stock outstanding.

TABLE III—SHOWING DIVIDENDS PAID AND YEARLY RATE IN PER CENT.

	Amount	Average Yearly Rate, Per Cent.
1857-1870	$14,230.20	5.2
1870-1875	10,864.00	7.0
1875-1880	18,582.40	11.8
1880-1882	6,208.00	10.0
1882-1887	23,900.80	15.4
1887-1892	20,796.80	13.4
1892-1908	93,740.00	18.9
1908-1912	44,232.00	35.6

The net result of the operations of the company has been to create in the period from 1857 to 1912, fifty-five years, a plant having a value as carried on the books of $170,893.08, against which is outstanding capital stock to the par value of $31,040.

It will thus be seen that approximately 82 per cent of the company's present plant was provided for from earnings in excess of the amounts paid out in dividends, this surplus, however, having been built up in approximately forty-two years, or at about an average rate of 2 per cent per annum. We can easily conclude that plant in excess of capitalization exists, and if this is the only basis on which stock dividends are to be justified, no further investigation is necessary.

TABLE II—SHOWING COST OF PLANT, DIVIDENDS PAID AND OTHER DATA FOR DIFFERENT PERIODS FROM 1857 TO 1912
BRIDGETON GAS LIGHT COMPANY

1880-1882	51,403.82	54,539.45	6,208.00	6,271.17	12,479.17	11.5	5.7	5.8
1882-1887	57,674.99	60,715.42	23,900.80	6,080.84	29,981.64	9.9	7.9	2.0
1887-1892	63,755.83	72,685.52	20,796.80	17,859.38	38,656.18	10.7	5.7	5.0
1892-1908	81,615.21	134,133.87	93,740.00	95,037.32	108,777.32	8.8	4.3	4.5
1908-1912	176,652.53	191,046.80	44,232.00	28,788.55	73,020.55	9.6	5.8	3.8
Average per annum:								
1857-1912	....	80,160	4,228	3,108	7,336	8.9	5.3	3.6
1870-1912	....	97,937	5,198	4,066	9,264	9.5	5.3	4.2

It appears desirable, however, to inquire into the rates charged by the company during the period in which the surplus was built up. Were these rates in themselves reasonable, and did they result in more than a fair return to the owners of the property?

Table III, already mentioned, is a statement of the dividends paid and the ratio between the amount of dividends and the amount of capital stock outstanding, but it does not fairly represent all of the pertinent facts.

TABLE IV—SHOWING REVENUES, EXPENSES AND OTHER DATA

	1887-1892	1892-1908	1908-1912
Gas sales	$77,715.13	$399,069.11	$191,417.50
Miscellaneous operating revenue	7,282.06	75,836.68	39,631.23
Gross operating revenues	$84,997.17	$474,905.79	$231,048.73
Operating expenses	51,913.53	307,334.33	157,047.14
Net operating revenue	$33,083.64	$167,571.46	$74,001.59
Non-operating revenue	2,396.85	21,206.66	2,705.88
Gross revenue	$35,480.49	$188,778.12	$76,707.47
Thousand cubic feet gas sold	52,698	360,622	191,417
Gas sales per thousand cubic feet	$1.48	$1.10	$1.00
Operating expenses per thousand cubic feet	.99	.85	.82
Net revenue	$0.49	$0.25	$0.18

Table IV is a general statement of revenues and expenses of the company divided into three periods, showing the gas sales and operating expenses.

Table V is a statement of the rates charged since the organization of the company in December, 1857. This table shows that there has been a gradual reduction in the rate charged, and that since 1906 the rate has been $1 per thousand for all purposes and to all customers without discrimination of any kind. This rate bears very favorable comparison with the rates charged in municipalities having similar conditions and comparable population.

Independently of the analysis of cost made up from the books of the company, an appraisal of the physical property was made which developed that the cost to reproduce the property new was not far from $240,000. The present value of the property, allowing full theoretical depreciation, was not far from $190,000. The variation between the figures representing the appraised values and the costs as indicated from the books is explained by the fact that many large items of replacement were charged to operating expenses at the time the work was done, in addition to which depreciation was written off from time to time, much as is customary with commercial concerns.

TABLE V—SHOWING RATES CHARGED FOR GAS PER THOUSAND FEET SINCE COMMENCEMENT OF COMPANY'S BUSINESS

Dec. 1, 1857, to Oct. 1, 1864	$4.00
Oct. 1, 1864, to Oct. 1, 1866	5.00
Oct. 1, 1866, to July 1, 1875	4.00
July 1, 1875, reduced to	3.50
July 1, 1877, reduced to	3.00
July 1, 1878, reduced to	2.50
July 1, 1882, reduced to	2.00
Jan. 1, 1886, reduced to	1.80
Jan. 1, 1887, reduced to	1.70
Jan. 1, 1888, reduced to	1.50
May 1, 1894, reduced to	1.35
July 1, 1897, reduced to	1.25
July 1, 1898, reduced to	1.20
Jan. 1, 1899, reduced to	1.10
Nov. 1, 1906, reduced to	1.00

The present rate of $1 per 1000 feet is the uniform rate to all consumers, large or small.

We are next concerned with the question as to the proportion of the net earnings which was paid out in dividends and the proportion invested in plant. It will be readily agreed that the management of a company would have the right to invest its net earnings in extensions to the plant instead of paying them out as dividends. Examination of the seventh column of Table II shows the percentage which the dividends paid bore to average cost during the period in which the dividends have been earned. The sixth column of Table II shows the percentage the net earnings were of the capital invested during the corresponding period. This shows that the average net earnings for the entire fifty-five years amounted to 8.9 per cent while the average for the period since 1870, at which time the company appears to have made up all of its operating deficits and to have paid a dividend averaging 4.9 per cent, is 9.5 per cent. This amount has been disposed of in two ways. Column 7 in Table II shows the per cent paid out as dividends, and column 8 in Table II shows the per cent invested in plant.

If it is conceded that an average net return on capital legitimately invested amounting to 9.5 per cent is not excessive and unreasonable, then no fault should be found with the method which this company has pursued.

As to whether an average return on capital invested amounting to 9.5 per cent is excessive and unreasonable must be looked at from various standpoints. A comparison of this figure of 9.5 per cent with the average net return on utility properties generally shows that this figure is probably higher than is usually obtained in such investment. Comparison with industrial undertakings shows that textile mills, foundries and many other manufactories produce net incomes available for dividends ranging from 10 to 18 per cent. Indeed, it has been the custom with many of these larger industrial establishments to pay either 6 per cent or 7 per cent on the original capital invested, and to invest the balance in building up the business and adding to the plant. Almost all of the large department stores and large commercial establishments have been built up in this way, so that we are forced to the conclusion that an average net return of 9.5 per cent should not be considered as excessive and unreasonable.

This must however be viewed from another standpoint. What has been the result to the users of the product of this plant? This is best answered by an examination of the list of rates charged by this company from 1857 down to the present time. This list of rates is given in Table V. From this table it is seen that since 1906 the rate for gas to all persons and under all conditions has been $1 per thousand cubic feet.

It appears that the service rendered by the company has been generally satisfactory in regard to the quality of the gas and the conditions under which it has been delivered. The operations of this company extend over practically the entire city, and the population served is approximately the same as that of the city, which is about 19,000.

A study of the rates charged in a number of cities having a gross revenue somewhat similar to that of this company shows the average of a large number of such companies in New York State to be $1.20 per thousand cubic feet, and of a number of gas companies in Massachusetts of about the same size and average of $1.17 per thousand cubic feet.

> **"In the opinion of the writer the company in this case was fully justified in issuing capital stock sufficient fully to represent the present value of its property. The rates in themselves have been and are reasonable; the net result to the stockholders has not been excessive; the property created by means of revenues in excess of that paid out as dividends is undoubtedly the property of the stockholders and should therefore be represented by the proper certificates of ownership."**
>
> —*Philander Betts.*

In the opinion of the writer the company in this case was fully justified in issuing capital stock sufficient fully to represent the present value of its property. The rates in themselves have been and are reasonable; the net result to the stockholders has not been excessive; the property created by means of revenues in excess of that paid out as dividends is undoubtedly the property of the stockholders, and should therefore be represented by the proper certificates of ownership.

It will be noted that the case referred to was determined by analysis of the relation between value of property and capitalization representing it but not without due consideration of the rates as a result of which the surplus had been accumulated.

Conservative financing, in the opinion of many, requires that bond discount be amortized and that extraordinary costs for establishing business be also amortized. Many financial houses in accepting trusteeship under corporate mortgages include provisions for these items and provide also in many cases for the amortization of accrued depreciation, the result being in the end that the outstanding capitalization will bear a fair relation to the present or depreciated value of the property.

It has been the contention of some that the mere investment of earnings in extensions to the permanent plant of the company is sufficient justification for later capitalization of such expenditures. Those holding this view lose sight of the real purpose of capitalization.

Commissions, under certain conditions, have allowed the issuance of securities for the purpose of paying interest, rehabilitating property, replacements and other similar items not strictly chargeable to the permanent capital account. Such approvals, however, have always been coupled with the requirement for amortization of the amounts so expended. Capitalization represents property, nothing more and nothing less, and attempts to inflate capitalization are due either to misunderstanding or to a desire to deceive or mislead.

Equally improper and unwise, in the writer's opinion, was a decision of one of the commissions rendered some months ago refusing to approve the issuance of securities for the purpose of constructing new plant. In this case the company, which was a gas company, had been in the habit of paying for a large portion of its annual extensions from earnings. The commission decided that the policy theretofore actuating the company had been a wise one and concluded that the company should continue to be guided by the same policy.

In conclusion, capitalization ought to be approximately equivalent to the property which it represents, and wherever excess capitalization is present amortization should be provided, a plan which will ultimately result in reducing the capitalization to its proper relation to the property which it represents. On the other hand, a "stock dividend" is justified where the capitalization is below the fair present value of the physical property. This ideal condition is found in very few properties, but it is one to be heartily wished for by financiers, as well as by operators and investors.

PUBLIC UTILITY LEGISLATION

By MATTHEW S. DUDGEON

Lecturer on the Law of Public Utility Regulation, University of Wisconsin, Madison, Wis.

LEGISLATIVE regulation of public utilities which will insure adequate service at reasonable rates without injustice and without checking enterprise and initiative is alike most desirable and most difficult of attainment. Intelligent effort in any state to provide for such a regulation is worthy of consideration. The advanced ground Wisconsin legislation has occupied and the satisfactory operation of the law itself justifies reference to the public utility law of that State.

In considering regulatory statutes it is well to remember that centuries ago it became the common law rule, and that ever since it has continued to be the common law, that every public utility: (1) Must serve the public without discrimination; (2) must serve it adequately, and (3) must perform the service at a reasonable rate. By the terms of the federal constitution it may be said that a fourth principle is added: The public utility cannot be deprived of reasonable compensation for the use of the plant employed in furnishing the service. These four principles constitute a statement of the law as it is independent of the existence of regulatory statutes. In other words, the purpose of present-day regulatory statutes is to declare and enforce the law as it has existed for centuries, rather than to put any new duties or burden upon the public utilities.

With this conception of the law the framers of the Wisconsin measures had in mind certain other principles which found expression in the act, as follows:

a Absolute justice to the public utility as well as to the public must characterize an effective regulatory statute.

b Regulation is a function of the Legislature, but certain administrative duties connected with regulation can be well performed only by an expert commission.

c The commission should be a state body, rather than a municipal board, but certain purely local matters may be left to municipal control.

d The commission should correct abuses and supervise without attempting to become a managing board for the public utilities.

e A correct valuation is a basic condition precedent to effective regulation.

f Since all accounts and records must be accurate, honest, easily understood, and available for purposes of comparison, a uniform system of accounting is indispensable.

g The utmost publicity is desirable.

h The fullest facilities for collecting data must be provided.

i Dilatory court proceedings should be made impossible.

j Fixed-term franchises involve many difficulties in regulation.

k Wasteful competition is unwise and detrimental to the public and to the public utility.

l Municipal ownership should be made a possible alternative for ineffective regulation.

m There should be some incentive for initiating improvements and economies.

n Prior to enactment, every interest, private and public, should be heard from and its contentions considered.

The framers of the law felt that neither harshness nor injustice toward the public utility was a wise public policy. They sought, therefore, to regulate, but to regulate in a manner that would work no injustice to the utilities. The law bears witness that its framers, while taking a determined stand in defense of the rights of the public, have not countenanced any injustice to the owners of public utilities. The principle of reciprocal justice everywhere crops out.

It is universally conceded that to regulate public utilities is legally a function of the legislative branch of government. No thoughtful man maintains, however, that a legislative body is itself in

---

[NOTE.—Mr. Dudgeon took an important part in the drafting of the Wisconsin public utility law.—EDS.]

a position to exercise this function directly. It meets only occasionally; its members have no special knowledge of public utilities; its time is fully occupied in more purely legislative duties, and it has no facilities and no machinery for the collection of the data necessary to a decision as to the details of public utility service. So it is better that the Legislature first perform the purely legislative function of enacting a law that rates must be reasonable and that service must be reasonably adequate and non-discriminating. It then delegates to a commission the administrative duty of investigating and collecting the data relating to a disputed rate or service, so as to be able to determine whether or not a rate is reasonable or the service adequate. The distinction between the purely legislative function of lawmaking which cannot be delegated to a commission on the one hand, and the quasi-legislative or administrative functions of investigating the facts, and applying and enforcing the law which may be delegated, was clearly conceived and observed in drafting the Wisconsin measure.

If it be granted that a commission is the proper regulatory body, the question as to whether the commission should be a state or a municipal body arises. The considerations that led the Wisconsin lawmakers to give jurisdiction of public utilities to a state commission rather than to any municipal board were: (1) Many of the problems of public utility regulation involve inter-city transactions; (2) the intricacies of valuation, uniform accounting and computation of rates, and the difficulties of investigating adequacy of service cannot be successfully coped with by city councils of transient existence; (3) one large force of experienced experts will work more economically and efficiently than a less experienced force hired by, and working in, only one city, and, of necessity, often inadequately paid.

At the same time the democratic desirability of reserving to the municipalities as liberal powers of home rule as possible was recognized. The framers of the bill felt also that it would not be well to burden the commissions with determinations of questions purely local in their nature. The law, therefore, gives to the municipality, in certain cases, the power to determine by contract or ordinance the character of the service which will meet local needs, and to prescribe the terms and conditions upon which a public utility may be permitted to occupy the streets. The municipality also has the power to require of any public utility such additions and extensions as shall be reasonable and necessary in the interests of the public. These powers are exercised, however, subject to appeal to the railroad commission as to reasonableness.

There are limits to commission regulation. No commission, however well qualified and equipped, is competent to conduct all the details of the affairs of the diversified public utilities within an entire state. It cannot be a substitute for the management. In the Wisconsin law it was planned to make the commission not a managing, rate-making board, with multitudinous duties which would swamp any commission, but rather a supervising board. No wholesale overhauling of rates or service was contemplated. The schedule of rates and service in force at a certain date, arbitrarily designated, was declared the legal schedule until rates or service were investigated and changed upon complaint of a patron, upon petition of the public utility, or because of some inadequacy or unreasonableness discovered by the commission.

> **"The distinction between the purely legislative function of law-making which cannot be delegated to a commission on the one hand and the quasi-legislative or administrative functions of investigating the facts and applying and enforcing the law which may be delegated, was clearly conceived and observed in drafting the Wisconsin measure."**
>
> —*Matthew S. Dudgeon.*

All commission-made rates must provide for a reasonable percentage of profit computed upon the value of property employed in furnishing the service. The value to be used in the mathematical computation necessary to determine this percentage of profit is of basic importance and must be definitely fixed. If the value be too high the result would be an unreasonably high rate. If the value be too low the result might be a rate so low as to be unconstitutional. Any system of regulation which does not include a proper valuation of the property actually used and useful for the convenience of the public is a failure, no matter how perfect it may be in other particulars. The Wisconsin law emphasizes the importance of this process of valuation.

Among the charges to be paid out of the receipts from the rate imposed is the current expense of operation. The possibilities and intricacies of accounting are such that if given a privately devised, uninspected, unregulated system of accounting, any expert accountant would have the public and the commission at his mercy. It would be possible to conceal from casual inspection practically unlimited profits. Almost any extravagant schedule of rates might be demonstrated to be justifiable. Hence, next to a correct valuation nothing is more essential to proper regulation than an open, honest, uniform system of accounts. Under the Wisconsin law, the public utility is required to keep its accounts in such form as the commission may prescribe, and no accounts other than those either prescribed or approved are permitted. Secret sets of books or accounts are made illegal. Examination and audit of the accounts may be made by the commission or its agents, and all items must be allocated to the accounts as the commission may direct.

It is expressly made the duty of the commission to require the utility to keep its accounts in such a

> **"Certainly some device which will preserve to the investors the fruits of energetic improvements should be incorporated into a regulatory measure."**
> —*Matthew S. Dudgeon.*

manner as to distinguish clearly between operating expenses and the cost of new construction. This is obviously to prevent any attempt to justify high rates by charging the cost of new construction to the operating expense account.

The public utility must in its report show in detail every item of expense going to make up the cost of producing a unit of service. Tables showing unit costs are important for comparative purposes. They are not only an aid to the commission in determining reasonable rates, but are of service to the utilities in the study of the efficiency of operation. The reports of the commission containing these details are comparable with the valuable English publications known as "Field's Analysis" and the "Gas World's Analysis of Accounts."

The law requires the publication of annual reports from the commission and permits such monthly or occasional reports as the commission may wish to issue. No facts or information in possession of the commission can be withheld from the public, except in cases where the commission determines that the interests of the public require secrecy. In such a case, information may be withheld for a period not exceeding ninety days. Full publicity prevents actual fraud and allays unjustified suspicions of fraud. It compels open and fair dealing between corporations and the public and tends to establish between the two a mutually helpful co-operation. It protects the commission and all public utilities from a multitude of ill-considered and unfounded complaints. It also places the commission itself under the constant surveillance of the public, a not unwholesome situation.

The Wisconsin law is not aimed simply at certain specific evils. The theory upon which it is framed is that absolute publicity coupled with full power to regulate and supervise will prevent any wrong from being perpetrated upon the public now or hereafter. It, therefore, gives to the people and to the commission opportunity for honest and complete knowledge of the affairs of the public utility.

The law does not expressly grant to the public utility any new right of recourse to the courts for the vacation or modifications of the orders of the commission. Recognizing, however, that such rights have a constitutional existence, the law undertakes to insure a speedy procedure which will prevent dilatory tactics upon the part of the corporation interested. It accomplishes this by providing for short periods of notice and prompt hearings, and by giving actions for review precedence over all other civil actions both in trial and appellate courts. The determinations of the commission are made in all cases *prima facie* reasonable and lawful, and the burden is placed upon the party complaining to prove them otherwise. The orders of the commission go into immediate effect and no injunction can issue suspending or staying any order, except after hearing upon notice to the commission.

The law has also the somewhat unique provision that if evidence is introduced before the court different from or additional to that offered upon the hearing before the commission, the court must transmit forthwith to the commission a transcript thereof and stay all proceedings for fifteen days. The commission must consider this additional evidence upon its receipt, and may thereupon modify or rescind its previous order and report its action to the court. This provision tends to induce all parties to present their case fully and fairly to the commission, and to a certain extent secures the co-operation of court and commission.

The plant of a public utility operating under a fixed-term franchise is likely to be, at the end of the term, of little more than scrap-heap value. With rates unlimited it has always been possible for the public utility to earn, besides interest on the investment, profits sufficient to replace rapidly the amount expended in construction. With the prospect of regulated rates, the public utilities were prepared to make the claim that rates must be high enough to provide for the accumulation of a sinking fund aggregating the value of the plant before the expiration of the term of years provided for in the franchise. The courts seem not to have settled whether such a position is tenable or not, but it is a question that would seriously embarrass any commission.

Facing these conditions, the framers of the Wisconsin law provided in the law that all franchises hereafter granted shall have the effect of permits "which continue in force until such time as the municipality shall exercise its option to purchase as provided in the act." The holders of the present terminable franchises may exchange them for indeterminate permits.

The demand for state control evidences the failure of open competition to regulate. Such failure is the justification for state interference. There is genuine justice in the claim that if regulation is to rob the companies of all but the most meager profits, it should protect them from losses which result from unjustified competition and which cannot be recouped from the limited earnings permitted under state regulation. The framers of the bill realized that the interests of the public and of the public utilities alike demanded that competition be so limited as to prevent uneconomic waste. The law provides, therefore, that no franchise or permit shall be granted to operate any plant in a city where there is already in operation a public utility engaged in similar service, without first securing from the commission a declaration that public convenience and necessity require such second public utility.

Where unregulated private ownership has failed to furnish adequate service at reasonable rates, there are but two alternatives, public control or public ownership.

Commission control of corporations has not always succeeded in the past, and future failure is still possible. Recognizing this possibility and recognizing also the right of the community to save itself from such a failure by employing the alternative of public ownership, the law provides, first, for the construction of a competing municipal plant if the commission certifies that public convenience and necessity require such competing municipal plant; and, second, for the acquirement of the plant of the existing public utility by purchase or through condemnation proceedings, whenever the municipality determines to take over the plant. No certificate from the commission is required to authorize the condemnation of the existing plant, since condemnation may be a refuge from inefficient regulation by the commission.

The indeterminate permit, which supplants the old form of franchise, contains an agreement that the municipality may purchase the plant for a just compensation to be fixed by the commission, subject to the review of the court.

It is often contended that state control entirely eliminates motives for initiating new improvements and economies, since increased earnings will eventually result, not in larger profits, but in an order to reduce rates. The Wisconsin law makes an effort to preserve the incentive of self-interest by permitting a sliding scale or other arrangement for the division of profits with customers or employees. This is an effort in the right direction. Certainly some device which will preserve to the investors the fruits of energetic improvements should be incorporated into a regulatory measure.

Such are some of the features which should characterize public utility legislation. Such legislation cannot be enacted, however, unless the Legislature is inclined to be absolutely just to the pubilc utilities, yet firm in its purpose to secure an effective law. The method used in drafting and enacting the Wisconsin law will be suggestive. The legislators were evidently anxious to frame an effective law, but were equally anxious to avoid every unfair feature. The committee having the measure in charge requested the Wisconsin legislative reference department to assist in drafting the bill.

The department at once detailed one of the lawyers employed in the department as draftsman. Prof. John R. Commons of the University of Wisconsin, who had long been a student of questions relating to public utilities and who had made extensive investigations in America and abroad, was called in for consultation and placed himself at the service of the committee. Several conferences were held and the general plan of the bill which the legislators desired was mapped out. The draftsman and Professor Commons with the committee then began the work of drafting the bill. Existing regulatory statutes were carefully considered. The decisions of the various courts relative to regulation of public service corporations were studied. Wherever possible, language which has been construed by the courts was used. In some cases a phrase or word was used only after an exhaustive study of decisions lasting several days. Experts in various parts of the country were consulted as to special features and their suggestions carefully considered. When a complete draft of the bill was made it was printed and copies sent to every man who was supposed to have any special knowledge of the subject or any feature of it. These copies of the bill were sent to economists, to practical experts, to managers and superintendents of public utilities, to lawyers and judges, and to mayors and aldermen of various cities. Each was asked to comment upon and criticise the measure. The public utilities themselves were specially urged to present their views. Many, financially interested, responded in a disinterested manner with valuable suggestions. The representatives of the legislative reference department were present at these hearings. All arguments advanced before the committee were taken in shorthand, and a typewritten transcript was later used by the committee in its executive session. The facts stated, the court decisions cited, and the economic principles advanced by those making arguments upon the hearings were subjected to careful verification. After the hearings closed the committee took up in detail all suggested changes. Arguments pro and con were considered and weighed. Some suggestions were accepted and incorporated into the measure; many were rejected. Special attention was given to any suggestion of unconstitutionality, and no claim that injustice would result from any feature of the law was ignored.

A somewhat unique situation thus developed. Here were legislators, experienced draftsmen, eminent university economists, high-priced legal counsel and experts representing the special interests affected, state and city officials, as well as public-spirited lawyers, and citizens interested in behalf of the public, all centering their efforts and contributing their best thought toward the framing of a single law.

The law has been in operation for seven years. Its provisions have been tested, and both public and public utilities seem to agree that it is at once effective, just and practical.

FINANCIAL RELATIONS BETWEEN CITIES AND UTILITIES

By BION J. ARNOLD

Chairman Board of Supervising Engineers, Chicago Traction

IN a number of cities in this country arrangements of one sort and another have been made recently by which the municipalities share directly in the profits of the local electric railways and exert managerial influence in their operation. This movement is so vital in its nature and so far reaching in its consequences that each experiment must be studied carefully in order that its lessons may be well and promptly learned.

The partnership arrangement in Chicago has now been in operation for seven years, long enough for the determination of the wisdom of its provisions. It will be remembered that the city agreed with the railroad companies, as a condition preliminary to any settlement, that a valuation should be made and agreed upon which should be accepted as the initial price of the property. The difference between this amount and that of the outstanding securities was to be either sacrificed by the holders thereof or taken care of out of such net profits as the companies were allowed to make under the ordinances.

> **"During seven years the companies have paid themselves 7 per cent on their investment, * * * and have put about $14,000,000 in cash into the city treasury. By the end of twenty years I estimate that there will have been so deposited a fund, which * * * will, with accrued interest, amount to $90,000,000 at the end of the twenty-year period."**
>
> —*Bion J. Arnold.*

The railway companies saw fit to make this arrangement because almost every main franchise had expired, and operation was being conducted under temporary permits in the business districts of the city. One of the companies contended that it had a ninety-nine-year franchise under a certain ruling of the Illinois Supreme Court, but shortly after the settlement was made the United States Supreme Court ruled otherwise.

The valuation ultimately agreed upon was $50,000,000, the city allowing actually $11,000,000 more than the physical property was considered to be worth, partly because the legal decision mentioned above had not been handed down when the agreement was concluded and partly as the price of peace. Thus the $11,000,000 was in reality mainly allowed for unexpired ordinances and obsolete plants.

The most important provision made in the arrangement was that for the rehabilitation of the property and the extension of the system under public supervision. The agreed purchase price to the city, which is practically the bonding limit of the companies, was to be increased by the amount of the expenditures made for these purposes, and the expenditures were to be authorized by a board consisting of three men; one representing the city, one the company, while the third was to be chosen by both. The last-named was to be independent of both interests and his name was to be written into the ordinance. During the past seven years under this arrangement the purchase price to the city has been increased to about $140,000,000 by the cost of the rehabilitation of the old property and by extensions to it.

A second important provision of the contract provided for the acquisition of the railway property at any time by the city upon six months' notice, the price at any time to be the original $50,000,000, plus the amounts that had been added for rehabilitation work and extensions with the approval of the board. This will continue to increase by the method mentioned until in 1927, when the present twenty-year franchise expires. The amount will then be about $204,000,000.

A third provision is concerned with operation. The city granted a twenty-year franchise to the company, the maximum which could be granted under the state laws. The company operates the property, paying all operating expenses, including maintenance, insurance, taxes and a contribution to a renewal and damage fund, and receives 5 per cent interest upon the agreed purchase price of $50,000,000 plus additions as above. The balance of the receipts is divided between the company and the city, 45 per cent to the companies and 55 per cent to the city. During seven years the companies have paid themselves 7 per cent on their investment, including the above 5 per cent interest, and have put about $14,000,000 in cash into the city treasury. By the end of twenty years I estimate that there will have been so deposited a fund, which if invested in suitable securities netting 5 per cent income will, with accrued interest, amount to $90,000,000 at the end of the twenty-year period. The city can then buy for $114,000,000, which is $204,000,000 less this $90,000,000, a property having a tangible value of $150,000,000. In other words, this fund which the companies are putting into the city treasury is in reality an amortization fund, if it is allowed to accumulate properly, although it is not so called. It is thus seen that the price of the properties is automatically fixed and the machinery provided so that the city can acquire them at any time without dispute. When it is remembered that the present scheme was worked out after the municipality had endeavored to inaugurate municipal ownership, the wisdom of the present arrangement is obvious, as such ownership is automatically provided for whenever it is deemed necessary.

The question may be raised as to why there will not be a property worth $204,000,000 at the termination of the franchise. In the first place the new arrangement started with $11,000,000 in intangible assets. The railways of Chicago first operated horse cars, then cable equipment was substituted, next light electric cars were used and finally heavier electric cars became necessary. Thus not only was the sum of $11,000,000 paid for "junk" and franchises, as previously stated, but provision had to be made for the old cable system, obsolete cars, etc., which had to be eliminated, and for 400 miles of track which had to be rehabilitated. Hence the purchase price when all these things are done is about one-third higher than the tangible value.

We made a mistake, some of us now believe, when the ordinance was passed in not providing that all or at least some of the profits should be used as an amortization fund for the purpose of retiring this intangible value. This will probably be rectified in the consolidation plan now being worked out under which it is proposed that the surface, elevated and subway lines will be operated as one system.

The city of Cleveland made a solution of the traction problem quite different from the Chicago plan. Instead of an agreed purchase price a certain capitalization was agreed upon, and the company was allowed to earn 6 per cent upon that capitalization and no more. This capitalization may be increased from time to time under the supervision of a city railway commissioner. The fare was also reduced to 3 cents with provision for increase under certain conditions. That is, there was incorporated in the franchise a clause providing some flexibility by stipulating that if a reserve fund of from $300,000 to $500,000, established by the terms of the ordinance, cannot be maintained with a 3-cent fare the fare can be increased or the income can be increased by means of a charge for transfers. Since the company has some outlying roads to which the 3-cent fare does not apply and the fact that cash passengers pay 5 cents unless they happen to have the exact change ready, the actual average fare now collected is 3.24 cents. At present the operation is experimental at this rate, and the rate may have to be raised still higher, and I understand that it has recently been decided to charge 1 cent for a transfer in addition to the initial fare. It is possible to operate on a low fare in Cleveland because the agreed capitalization is very low. The plan is, in my opinion, an experimental one. If it succeeds it should be remembered that the citizens of Cleveland are getting and will continue to get only such service as a 3-cent fare or a 3.24-cent fare or a 3-cent fare plus 1 cent for a transfer will yield. They will never get a 5-cent service for a 3-cent fare.

> **"While I think that Kansas City has the best solution of the partnership arrangement so far worked out, the Chicago plan has worked very smoothly for seven years. * * * Chicago has watched with pride the growth of the city's fund, now amounting to about $14,000,000, and the citizens as a whole seem not displeased that the railways have earned 7 per cent."**
>
> —*Bion J. Arnold.*

The recently adopted Kansas City arrangement is a modified Chicago plan in which the "oversights" which I have mentioned have been eliminated. In Kansas City the railway was operating under a receivership. The citizens were rabid in their antagonism to the railway, as they believed that they had been misused. They felt that the system was overcapitalized, so much so that one of the leading papers of the city stated that the property was worth not more than $14,000,000, although, to be fair to it, this was before an actual valuation showed it to be worth much more. In fact, the company had vouchers to show that $35,000,000 had actually been spent upon the property. Under the settlement the company is to be allowed to earn 6 per cent on $30,000,000, and all surplus above this is to be invested in an amortization fund to be used in gradually retiring the intangible value of the property. The tangible property, as shown by my valuation, is actually worth more than $21,000,000 to-day so that the amount to be amortized is about $14,000,000. This is a fundamentally sound proposition for, if the railway is finally acquired by the city, it will be purchased for what it is actually worth, or if the property is continued under private ownership and management, the rate of fare can be adjusted on a basis of paying a fair return on real value where the intangible value has been amortized.

In conclusion I would say that while I think that Kansas City has the best solution of the partnership arrangement so far worked out, the Chicago plan has worked very smoothly for seven years. Of course we have had differences of opinion in Chicago from time to time as to the wisdom of the board's judgment on one point or another, but these have thus far been easily adjusted. Chicago has watched with pride the growth of the city's fund, now amounting to about $14,000,000, and the citizens as a whole seem not displeased that the railways have earned 7 per cent. While I personally believe that the $14,000,000 fund should be used as an amortization fund so that in time, after the intangible value has been eliminated, the patron of the street car will not be paying a higher price than it costs to render the service he receives, nevertheless the Chicago arrangement taken as a whole can be considered sound and successful.

COMMISSIONS AND THE N. E. L. A.

By T. C. MARTIN

Secretary National Electric Light Association

IT is a generally recognized fact that in the earlier days of all the great modern public utilities very little thought or care was given to the subject of regulation from the standpoint of safeguarding the public welfare, protecting the utility companies themselves, or insisting with equal emphasis upon the rights of the investors and the employees. The change that has come over the scene in all these respects in the last twenty-five years and more particularly the last ten, is little short of incredible. As one looks back it is now seen that what has come in the way of regulation by public service commissions was there to come and sure to come. But the main point is that regulation cannot be effected until there is something to regulate; until the new agency for public service and benefit has taken some kind of definite shape, and presents itself in concrete form as an entity that can be dealt with. New industries or utilities like the electric street railway or the electric light, or the industrial transmission and supply of electrical energy, have first to place themselves on the map before the legislative function can very well be applied to them. There had to be some wonderful periods and stages of invention, some strenuous times of financial and manufacturing competition, some tremendous efforts to raise capital for the installation of extensive plants; and it cannot yet be said that this introductory epoch or era has closed, for the advances in all the electrical arts are still frequent and often revolutionary. As in the case of the present dreadful war in Europe, it is extremely difficult to figure where and how it is all going to work out, but it would seem that in the public utility field we have in the public service commissions our Hague Peace Tribunal started, and some ruling body that can help to cut out an awful lot of trouble, turmoil and waste, the net gain to the public being in direct ratio to the efficiency of the commissions. We now have some forty-eight state commissions whose work applies directly to the regulation and control of public utilities, and while at the moment perhaps only about half of these have so far been developed from "railroad commissions," or created specially to deal with all public utilities generally, it is evident that in the long run every such body of officials will have entire utility regulation placed in its hands. That is the proposition before us, although in many quarters legislatures having substituted this kind of stable administrative control for their own spasmodic butting in, show an inclination to hamper the system thus wisely set up.

The National Electric Light Association may fairly and reasonably be credited with an early appreciation and acceptance of the new conditions. As far back as 1905-1906 it organized its first public policy committee, whose gait and scope may be inferred from the fact that its sub-committees, all making reports, were: (1) on municipal ownership; (2) on public regulation and control; (3) on London sliding scale (gas) as applied to electricity; (4) on taxation and franchises; (5) on industrial insurance, rewards and pensions; (6) on publicity and popular education; (7) on rates and methods of charging. This looks like a large program, but the writer, as secretary of the association, can testify that at the very instant of writing, every one of these points of service, of development, of attack on economic heresies, of better service to the public, is being followed up either by the public policy committee or by similar committees to which it has delegated part of the work. All of this is based on the statement made in 1907, to which every progressive street railway man subscribes: "There is a community of interest between the public served and the corporation serving it. The goal of the regulating body should be to seek that happy medium as to prices charged and return upon capital arrived at which will result in maximum benefits in the way of service."

An illustration of the important work undertaken immediately after it thus got into action by the National Electric Light Association, was the codification and issuance in pamphlet form—really a bulky book—of the public service commission statutes of the states of Wisconsin, New York and Massachusetts. This was an intensely interesting and useful analysis and comparison which not only showed the trend of regulative legislation but quite surely helped to shape it in other states falling into line under the new régime. It was an expensive job and it was absolutely colorless as it offered no criticism or suggestion, but it was worth the price as a flat-footed proof of the tendency to variation and the hideous danger that lay in the future of the great central station industry and every manufacturer supplying its essential materials, if every state in the Union were to set up standards and criterions of its own. It sounds like a modified form of treason to say that any art shall dictate to a sovereign commonwealth what the art deems best, but, on the other hand, has any state the right to set up and dictate local standards which shall not be common to our whole 100,000,000 people?

Fortunately the National Electric Light Association has been able to enforce and insist upon its national point of view, and it is at once the duty and the pleasure of its secretary to state that it has been able to maintain reciprocity and co-operation with all the various public service commissions. It is in frequent, friendly daily communication with them. It has already established what is perhaps one of the most complete collections of their literature that exists anywhere in the world. Only those who are in close touch with the situation can have any idea as to the immense amount of matter thus coming out, much of it doubtless merely temporary and of fugitive value, but much of it charged with dynamite, opening up new conceptions of law and doctrine, not necessarily destructive but, let us say, reconstructive; a great deal of it intensely instructive and suggestive; on the whole sane and solid and reflecting the American ideal of treating everybody on the square.

Next to its codification of the Public Service laws in the three great States of Massachusetts, Wisconsin and New York, comes the work that the N. E. L. A. has done in trying to "keep tab" of all the essential decisions affecting utilities in its field, by the issuance of a special bulletin known as "Rate Research," now ending its fifth volume, a most useful and valuable compilation of commission rulings and decisions, supplemented by references to general literature on the subject and on such important matters as may be covered along this line in the technical press or in other ways. This sixteen-page weekly publication has nearly 1000 subscribers, which is at least an evidence of its value, and it now seems likely that through some process of broad co-operation among utility groups in the various fields, the pioneer work thus undertaken and so far carried on with brilliant success by the N. E. L. A. may flower and bear fruit in something much better. It may be noted incidentally that the commissions have been glad to assist in this work and share in its benefits.

Accounting has been another important subject on which distinctive effort has been made, and with success, to co-operate with the commissions. For some years the association has had a standard classification of accounts adopted by a great many of its member companies, which have control over a very large percentage of the income and expenditures of the industry. The intrinsic value of the system of accounts has been more or less directly acknowledged by all of the commissions, and as in the case of Maryland has been authorized, which means adoption. Work of this kind done in mutuality is still going on actively, as, for example, in the extension of part of the system to give a fuller expression to the significance of hydroelectric work, so that the system of accounting may conform as closely as possible with the requirements of commissions on the Pacific Coast, where so large a proportion of the electrical energy needed in the business is derived from water power. One example of the manner in which the association strives to secure national uniformity is given in the work this year of the accounting committee in collecting for examination the annual report forms and accounting orders prescribed by the various state commissions. The exhibition thus made of frightful heterogeneity, of moderate requirements in some cases and of illimitable micromania in other directions, and in general of a total lack of unanimity in applying the powers given to the commissions—is in itself sufficient reward for the effort. Obviously, the best thing any such public utility body can do is to help the commissions "find themselves."

> **"It sounds like a modified form of treason to say that any art shall dictate to a sovereign commonwealth what the art deems best, but, on the other hand, has any state the right to set up and dictate local standards which shall not be common to our whole 100,000,000 people?"**
>
> —*T. C. Martin.*

This last remark applies to even another line of work of vital interest to central stations, that which embraces the whole field of meters, a branch of development in which the central station differentiates wholly from the street railway, whose basic feature is the "register" as modified by the pay-as-you-enter method. The N. E. L. A. has a meter committee which does important work from year to year in watching and guiding the progress and perfection of consumers' meters, one type after another being needed as the art gets closer to its problem of universal supply. This year the committee prepared and issued with its report a large chart showing at a glance all the public service regulations, or laws, now in vogue bearing upon the installation and use of meters. It is a most instructive survey of quite unnecessarily conflicting conditions in a very highly specialized electrical art, in which for the production of the best instruments, of the highest precision, at the lowest possible cost, universality and uniformity are needed for the consumer, the utility company and the manufacturer, without any peculiar advantage to be derived by any group or class.

Other examples of this kind might be cited, but it is probably needless to pile them up. A final paragraph may be in order as to the attitude taken by the association as to the commissioners themselves. Here one deals with such a changing personnel, it is most difficult to maintain continuity of touch. A public utility company that changed its management every one, two or three years would be condemned at once as being in a "parlous," which means perilous, condition, but in the commissions men come and go, for politics are vicissitudinous, and the archangel of to-day may be the outcast of to-morrow. This is in itself one of the biting reasons why public utilities have been so ready and willing to submit to regulation provided it be but regulation that can regulate itself and be consistent. Where the people of the state have insisted that

"A public utility company that changed its management every one, two or three years would be condemned at once as being in a "parlous," which means perilous, condition, but in the commissions men come and go, for politics are vicissitudinous, and the archangel of to-day may be the outcast of to-morrow."

—*T. C. Martin.*

politicians should keep hands off, tolerant relations have been established between the utility and the commission, but this can in no wise be characterized under the head of friendship. The utility now has the respect and regard that any decent and competent lawyer has when appearing before the bench of the court in which he practices his profession. From the first, the N. E. L. A. has regarded it as both a duty and a pleasure to ask the various public service commissioners to participate in its conventions. In 1912 every commissioner on the Pacific Coast was invited to attend the Seattle convention. At the Chicago convention of 1913 every commissioner within range was invited to be a guest. At the Philadelphia convention of 1914, the head of the state commission was properly regarded as a guest of honor. There are very few national meetings for years past at which the head of the Massachusetts commission has not been gladly hailed as a guide and adviser, apart from his pre-eminence as a judge of unswerving rectitude, trying to hand out the square deal as between man and man. Equally noticeable is the fact that at all the meetings of the N. E. L. A. state or geographic sections, the effort has been made, mostly with great success, to secure the presence of some member or officer of the commonwealth commission, from whose presentation of its point of view help and illumination could be secured as to what the utilities must do, or are expected to do, by the commissioners, to live up to the full measure of their opportunity in service to the public.

It is perhaps at this juncture that further evolutions of relationship appear in order or are gradually putting themselves in evidence. There is in reality to-day no central authority among the commissions to which resort can be had to secure uniformity of action in regard to very large problems in the central station field. To some extent, the member companies of the American Electric Railway Association come within the purview of the Interstate Commerce Commission; and of course there are the meetings of the various railway commissions in convention duly assembled when traction questions dominate and all else is forgot. This does not help the central station industry at all, and makes it most difficult for such a body as the National Electric Light Association, aiming at uniformity, unanimity and universality of apparatus, methods and practice, to suggest, let alone enforce its ideals, in such respects. Evidently there must come for the best interests of all concerned—the nation itself in these electric days—a *modus vivendi*, a getting together. The symptoms of this are seen in the work already being done in some of the state or geographic sections of the N. E. L. A. in co-operating with the state commission by way of standing or special committees of the organization to consult on any new proposition that may come up. Let it be recognized that fundamentally the real underlying idea of any commission is regularity and uniformity, in the enforcement of which the largest number of people possible get the same treatment in the shape of justice and equity. To such an end all most co-operate, or admit themselves advocates of discrimination and difference. Failing a central commission body—not forgetting the admirable work being done by the United States Bureau of Standards—there is thus developing among the state branches of the N. E. L. A. a system of co-operating by committee with the local state commission, so that when a serious question comes up the commission can get the utility point of view and the best technical data or advice that its utilities can give, before any vital action is taken. This process is already in evidence, and as it advances it may happily lead on to the condition where no one commission will assume infallibility but will be guided, as must we all in the long run, by the force of mature public opinion.

Possibly a sympathetic note may be struck within the American Electric Railway Association when reference is made to the amount of time and energy consumed in regard to public service commission work by members of the National Electric Light Association. Once and again, and then again, men whose heart is in their work, whose one aim is to reach higher and highest efficiencies in serving the public, are called off their jobs to take care of some minor order, ruling or sleight complaint or criticism that filters through the commission office. We have heard of breaking a butterfly on the wheel, but these are ghastly instances of breaking the useful wheel at the instance of some giddy, evanescent butterfly. The writer knows something from observation of the discouragement of spirit and the bitterness of heart, the inevitable lowering of efficiency on the part of many central station men at the point of physical exhaustion seeking to deliver the goods to a million people, but quite often tripped up and baited and mauled and overworked by incessant hearings and inquiries. Out of that wretched stage we are already emerging, but some of us feel that the central station men who have loyally helped to carry out the public service commission principle, who believe in it heartily, and desire its utmost development along national lines, as an essential part of our modern system of government of the people, by the people, for the people, are entitled to fuller praise and consideration than has yet been accorded to them.

PUBLICITY ON ELECTRIC RAILWAYS

This Article Describes Typical Methods of Securing Publicity in Use on a Number of Electric Railway Systems. It also Contains a Newspaper Editor's Views on the Subject

IN several of the contributed articles published elsewhere in this issue stress has been laid upon the importance of full publicity on the part of the electric railway companies of their actions and problems, so that the public may be better acquainted with both. There is also a unanimity of opinion that publicity is useless without good service. An attempt to bolster up a deficient treatment of the public by publicity in any form is useless. No amount of fine printing or exuberant oratory will take the place of the good service to which the public is entitled, but if this is supplied, every advantage is to be gained by publicity. No service can be perfect, and even the struggle to make it better may cause inconvenience to the public. Hence it is always important for the riders to understand why delays are necessary, or why they are obliged to transfer at unusual points. A large steam railroad has recently adopted the practice of reporting directly to the passengers the reasons for unexpected hold-ups. What is true in regard to traffic conditions is also true in larger matters such as financing, franchises, etc.

A most obvious way of reaching the public is through the reading and advertising columns of the newspapers, but posters, circulars, or useful articles such as drinking cups, fans and even hatpins have been used to good purpose. Public service commissions have been organized partly to insure publicity of public utility matters, and while this function should possibly not have been necessary, they are now very important publicity agents for the electric railways.

Systematic publicity work among electric railways may be said to be a development of the last decade. Before that practically all the news on electric railways which appeared in the daily papers was secured by the newspaper men from unofficial sources, and when such information came from headquarters it was obtained by the reporter only after a great deal of effort on his part and often at serious inconvenience to one or more of the officers of the railway. The point lost sight of at that time by the railway officials was that the daily newspaper man had to publish the news as it came to the office of his paper, and that after an unsuccessful attempt to interview the railway officials, the reporter would use such information regarding the company as came to hand from outside sources. Mistaken attempts to thwart newspaper men simply serve to whet their appetites. In the words of an editor who has contributed his views to this chapter the tip which is in the newspaper office is sure to appear. But as this gentleman says, the manner and form of its appearance remain largely with the railway man. Attempts at suppression are retroactive. Never was censorship more strongly enforced than in the present crisis in Europe, yet there was that terrible story in the staid London *Times* saying that the British force in France had been "broken to bits." If there had been no embargo on news it is very improbable that there would have been any such sensational dispatch. As the New York *World* said editorially in commenting on attempts made to throttle the press: "One of the surest ways to promote falsehood is to suppress the truth. When facts cannot be had, people are thrown back upon the imagination, and there is no terror in this world like that which exists only in the mind."

With the line of demarcation fixing the responsibility for giving out news not sharply drawn by the railways, it was only natural that railway men, fearing misquotation and misconstruction, were loath to speak for publication. In short, no one making a statement for the press knew how his utterance might be viewed by the man higher up. From this rose the practice of designating some official of the company, or of appointing as official some one with a newspaper experience, who would know what the papers wanted and could secure it readily. This plan has now been adopted by such companies as the Brooklyn Rapid Transit Company, the Boston Elevated Railway, the Interborough Rapid Transit Company, the Portland Railway, Light & Power Company, the Illinois Traction System, the Southern Pacific Company, the Detroit United Railway, the Toledo Railways & Light Company, the Empire United Railways, the Public Service Railway, the Washington Railway & Electric Company, the Puget Sound Traction, Light & Power Company, the Twin City Rapid Transit Company, the Bay State Street Railway, the International Railway, the Northern Ohio Traction & Light Company and many others. It was deemed advisable to secure for this chapter as far as possible the ideas of men in charge of publicity work of representative city and interurban companies and to present the views of these men only as they concern their respective properties. Men on other properties entrusted with similar duties can thus see what has been attempted and accomplished elsewhere and appropriate to their own use such ideas and suggestions as may appeal to them as suitable for application to their own needs. The companies whose practice is described, however, by no means comprise all of those which have established publicity departments. They are simply examples illustrative of modern custom. Other, and possibly more conspicuous instances, may occur to the reader, such as the Toledo dispute where one of the most elaborate and aggressive campaigns has produced markedly good results.

This much has been firmly established. Publicity work to be successful must be founded on confidence. The work of the man to whom this phase of public relations is entrusted is always intensive, frequently educational and sometimes must be preventive. The soft answer will not, however, turn away wrath unless the management lives up to promises which are made. It is infinitely worse to break the promises made than never to have made them. The late J. P. Morgan was not so much concerned with the present financial ability of men to whom he made loans as he was with the reputation which men had for carrying out their promises. The credit system which Mr. Morgan set up as a criterion for judging men does not differ materially from that set up by editors.

BOSTON ELEVATED RAILWAY

The Boston Elevated Railway was the first company in the United States to establish a publicity department, and since the inauguration of this service in 1897, under the presidency of Col. William A. Gaston, its work has been continuous under his successor, Gen. William A. Bancroft. Within the past two years the financial burdens of the company have necessitated some curtailment of what might be called "originating publicity," but the duties of the publicity agent closely resemble those outlined in the ELECTRIC RAILWAY JOURNAL of Oct. 26, 1907, in so far as response to outside inquiries is concerned. The publicity agent reports to the second vice-president under the present organization of the company, and a broad co-operation is maintained between all of the general offices and the publicity agent, whose office thus becomes a general informational clearing-house.

Inquiries from outside sources directed to the publicity department cover such subjects as operation, construction, equipment, legislation, plans, policies, accidents, etc. The office is open daily from 9 a. m. to 5 p. m., except on Sundays and holidays. Inquiries received after the close of the office are referred to the superintendent of the day, who is located at the company's general office on Milk Street in Boston. During the late arbitration hearings the publicity department performed valuable service in supplying the press with copies and digests of statements, tables of data, etc., and the newspapers utilized this material liberally in the accounts of the hearings, which extended through several months and included a large amount of technical testimony. A small library is maintained as a part of the publicity department's office, located on the same floor as the general offices of the company and in close touch with these. Complete files of clippings bearing upon the company's work are maintained.

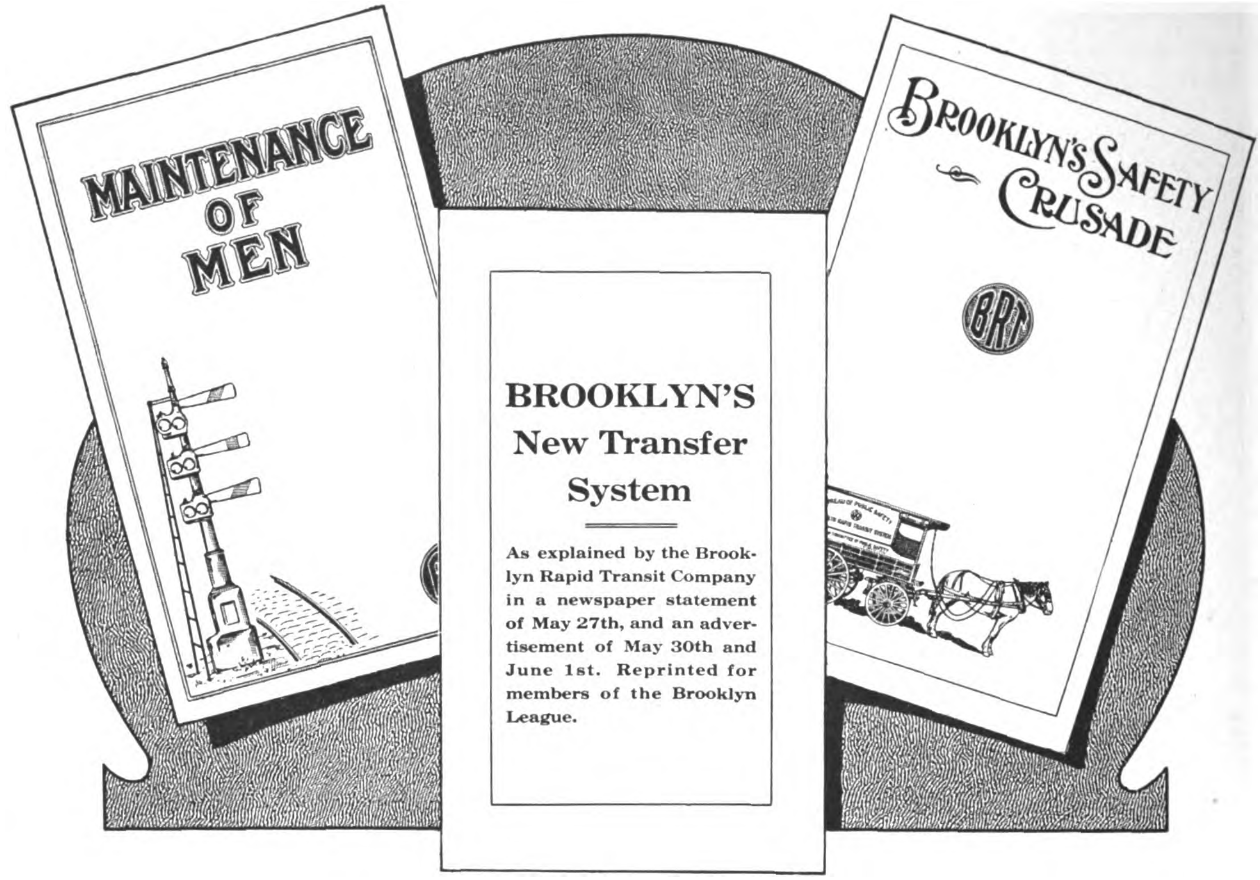
THE BROOKLYN RAPID TRANSIT COMPANY

The Brooklyn Rapid Transit Company has no regularly organized department of publicity but pursues a general policy of giving out freely all information solicited when it can be properly given to the public. President Timothy S. Williams makes it a rule personally to receive inquiries relating to the work and policies of the company, and in this informational work he has the active co-operation of H. A. Bullock, his staff assistant.

As an important element in maintaining proper relations with the public all departments keep in close touch with their employees through bulletins issued from time to time. For example, the transportation department, in addition to the regular bulletins of an instructive character calling attention to existing rules or establishing new ones, also puts out special bulletins under such titles as "Health Hints for the Summer Months," "Health Hints for the Winter Months," "Concerning Profanity," "Safety Always—A Holiday Motto." Whenever matters of general importance seem to require it, the company issues bulletins to all employees in convenient pocket folder form. Recently when the workmen's compensation law became effective in the State of New York, a special pamphlet was issued. In this, as in other such publications, the employees were not merely furnished with the bare legal requirements of the law, but they were supplied with information intended to explain the essential relationship of the company and the men under the new law. The company has a means for keeping in close touch with the employees through the Employees' Benefit Association, in which the social activity of the employees is centered.

In its direct relations with the public the company's main problem is to insure an accurate knowledge of the facts connected with the operation of the system. It has not been found necessary to use means to stimulate traffic, as the territory has grown, in many instances, more rapidly than it was possible to provide facilities to accommodate the new business. Whenever specific matters relating to traffic need to be called to the attention of the public, this is done through large posters placed in the cars, supplemented occasionally by the distribution of leaflets. On the whole, however, the principal purpose of the publicity work of the company is to improve public relations in general. The basic policy underlying this work is that the public should be kept fully advised in regard to the affairs of the company and especially of the peculiar problems which have to be met. The company has had an unusual opportunity to become acquainted with the public, and to explain its work and methods, during the present expansion in Greater New York.



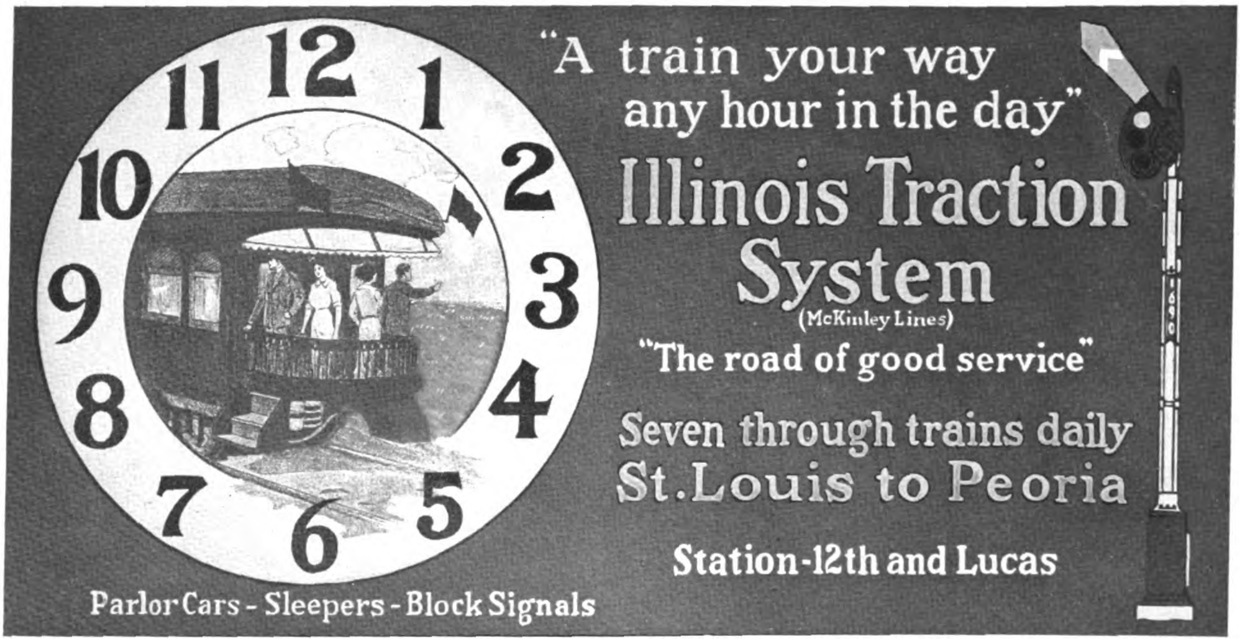
As explained by the Brooklyn Rapid Transit Company in a newspaper statement of May 27th, and an advertisement of May 30th and June 1st. Reprinted for members of the Brooklyn League.

COVERS OF THREE CIRCULARS ISSUED BY THE BROOKLYN RAPID TRANSIT COMPANY FOR GENERAL CIRCULATION

In the effort to improve public relations four general methods are used, as follows: Newspaper inquiries are responded to fully and frankly as received; from time to time formal statements of the company's attitude on important questions are issued; newspaper advertising campaigns are carried on for special purposes, and reprints of important advertisements are distributed on the cars when some special message is to be given to the public.

Elaborating somewhat on these four subdivisions of general publicity work it should be said first that the success of this work is due largely to the personality of Colonel Williams, who is noted for his frankness in responding to newspaper inquiries. Any properly accredited newspaper reporter can see him without difficulty any day when he is in his office. If the inquiry is of a general nature or relates to subjects requiring specific attention by departments it is handled by Mr. Bullock, who obtains the information direct from the company official most directly in contact with the subject under inquiry or puts the inquirer into communication with this official. As a result of this practice newspaper men accept the statements of the company at their face value when it is necessary to tell them that a subject cannot be discussed at the time of an inquiry. Experience has shown them that the company will furnish the information whenever it can properly be published.

The formal statements of the company's attitude on important questions, which are issued from time to time, are generally signed by the president, although sometimes they are issued simply over the signature of the Brooklyn Rapid Transit Company. Letters to public officials explaining the attitude of the company on subjects of public concern are also sometimes given out. The endeavor is made not to overdo the issuance of statements by attempting to drag in discussion which is not properly a matter of news. As a result, the statements receive better consideration than if the company attempted to force publicity by issuing statements on all sorts of subjects or attempted to secure the publication of prepared matter not given out over the signature of the company itself or some responsible official. When formal statements are volunteered by the company or issued in response to inquiries, all of the morning or the afternoon papers, as the case may be, receive them, but when information is obtained in response to specific inquiries for particular papers these papers are protected in their news as it is withheld from others unless another newspaper asks the same questions. It is sometimes found difficult to draw a line between a question which justifies a general reply and one which entitles the newspaper asking it to receive protection in its information. The company finds that the safest criterion is whether the subject matter of the answer is something which the company would normally be giving out itself if no newspaper inquiry had been made.



TYPICAL CARD USED IN ADVERTISING THE TRAIN SERVICE OF THE ILLINOIS TRACTION SYSTEM

During the past year the company has been advertising extensively in the Brooklyn newspapers. During the preceding rapid transit campaign, conducted during the previous year, extensive advertisements were carried in the Brooklyn and Manhattan papers. The recent campaign was a continuation of this one. The principal feature was a series of advertisements entitled "Why We Need the Nickels." In these chaptered advertisements various problems were discussed and the difficulties which beset the operation of the company were frankly stated. These advertisements formed a continued story and were recently issued in a special booklet.

Mention has been made of the distribution of reprints of important advertisements in the cars. This is a very efficient way to secure a large and immediate circulation of such material. As many as 375,000 copies of such reprints have been distributed in a day when the subject at issue was one of a very heated discussion. On another occasion, without any special stress or excitment, a circulation of approximately 100,000 per day was maintained for several days. The company has now under consideration plans for systematically utilizing this means for distributing educational material.

One of the recent very effective means for giving out information on the new rapid-transit construction work is a monthly bulletin showing the status of the work. This is issued in mimeograph form, and the newspapers have given it very fair attention. It has a distinct value in the present situation, when a great many inconveniences are experienced in different parts of the city as the result of pending reconstruction of existing facilities and the construction of new ones.

THE "TWIN CITY" SYSTEM

The publicity work of the "Twin City Lines" is in the hands of A. W. Warnock, general passenger agent, who believes that "making the public your friend is a fine art, and like most arts, it is an extremely simply one, once you know how." Mr. Warnock's experience shows that friendly public sentiment can be developed through the giving out of accurate information on such subjects as "Why Present Rates of Fare Are Not Unreasonable," "How the Electric Railway System is Operated," etc. In reaching the general public the company has found the best mediums are the daily and weekly newspapers, window cards in the cars, folders and time-tables.

The company uses a great deal of advertising space in the local newspapers, utilizing such space liberally whenever there is any important announcement to be made, such as changes in schedules or any other matter which requires the co-operation of the public. In the news columns the company makes no attempt to play up new construction or development work, feeling that the papers are somewhat chary of printing matters of this sort. Mr. Warnock is, however, always ready to co-operate with the newspapers in getting up stories, and the company is on the friendliest relations with all of the local papers.

Window cards in the cars are found to be very effective means for reaching the public. The endeavor is made in these to teach some lesson of importance in promoting efficient transportation. Among the titles of these cards may be mentioned "Please Read Your Transfer," "Suggestion to Passengers," "For the Comfort of Passengers," "For Better Service," "Regarding Small Children," etc.

The "Twin City Lines," to an unusual extent, makes use of folders and time-tables, advertising particularly its steamboat line on Lake Minnetonka, the White Bear Lake Resorts, Minnesota State Prison, and points on the Stillwater line. In getting up this printed matter the underlying motive has been to produce something of a very high class, in the belief that cheap printed matter is not acceptable to the public and does not hit the mark. Handsome folders like one recently issued under the title, "The Twin Cities—1914," are highly prized by the public, and local publicity organizations of a civic nature are glad to send these out to people inquiring as to the merits of the "Twin Cities" as a permanent residence. The 1914 folder was the ninth annual publication. Of the folders just mentioned 52,000 copies were printed this year, and time-tables giving information regarding the Lake Minnetonka and Stillwater lines have been printed in editions of 35,000 to 50,000 copies each. A local company distributes these folders in all hotels, ticket offices and folder racks, and the steam railways use quantities for distribution to prospective tourists. For a period of five weeks at the beginning of the season the company advertised that this folder would be sent to any address on receipt of 6 cents in stamps. From this advertising an average of nearly a hundred inquiries a day were received from people who

COVERS OF EMPLOYEES' MAGAZINES PUBLISHED IN KANSAS CITY, SAN FRANCISCO AND DENVER expressed an intention of spending a day, a week or longer in the twin cities. The steamships on the Great Lakes, from Buffalo to Duluth, are also supplied with these folders, and tourists destined for Minneapolis are given copies. The same holds true on the Mississippi River steamboats.

In reaching its own employees the company uses no regular publication, but prepares small bulletins occasionally which can be handed to the men with their pay checks. The bulletin boards posted in the clubrooms are also useful for this purpose.

To quote Mr. Warnock in a recently published statement: "I hardly agree with the sweeping statement that the public is always unreasonable. It is our experience that the average public is a pretty decent public. Perhaps, who knows, what unfriendly feelings the public may entertain toward us may be largely our own fault. Don't we usually get what we give in all other relations of life? Maybe the same principle obtains in this matter."

THE INTERBOROUGH RAPID TRANSIT COMPANY

The policy of the Interborough Rapid Transit Company of making a systematic effort to keep the newspapers informed of its activities dates back to the inauguration of the present management under Theodore P. Shonts, as president. The beginning, which was made at that time toward providing a center where correct information of the doings of the company could be obtained, has been developed until now the work of the department, which is under Henry Porter Waugh, has been extended to include the supervision of the publication of two monthly papers for the employees: the *Interborough Bulletin* and the *New York Railways Magazine.* Mr. Waugh was engaged in newspaper work for eight years in Atlanta, Knoxville, Nashville and Chattanooga. He then came to New York and for twelve years, up to 1909, was connected with the New York *World,* of which he finally became assistant city editor.

The bureau of which Mr. Waugh is the head secures records of all matters of public interest affecting both companies, such as new construction, changes in personnel, financing, accidents, etc., and makes such material available for the newspapers. Through it are also given out the monthly statements of earnings of both the Interborough Rapid Transit Company and the New York Railways. On these statements and such other information as is deemed advisable, a release hour is placed, as competition is particularly keen in New York in regard to financial matters, there being two independent financial news bureaus with ticker services. The bureau gives information wherever it is necessary to foster a correct understanding of any matter, and Mr. Waugh arranges for interviews between newspaper men and officials of the company. He is on call at all times either at his office or at his home. All the daily and other papers received at Mr. Waugh's office are scanned by him, and matters relating to the company are clipped and placed before the president, who forwards them to other officials who may be interested. The eclippings are afterward filed permanently for reference.

TYPICAL COVERS OF MAGAZINES PUBLISHED IN THE INTEREST OF THE EMPLOYEES OF THE SUBWAY AND ELEVATED, AND THE SURFACE LINES IN MANHATTAN AND THE BRONX

Mr. Waugh makes it a practice to inform the newspapers promptly of all the functions and activities of the company. An illustration of the method followed is shown in connection with the opening of the stores for employees where foodstuffs are sold at cost by the company. All the newspapers were informed in advance of the company's purpose, and on the afternoon of the day preceding the opening of the first store Mr. Waugh showed the newspaper men around. He left the talking largely to the man engaged as supervisor of all the stores, who gave the reporters such information as in his discretion would be of value to them in preparing their stories. Mr. Waugh also makes it a point to look after the needs of the newspaper men in connection with the other welfare activities of the companies, such as athletic events, picnics, theater parties and entertainments. He has also made it a practice to attend the public hearings before the Public Service Commission affecting matters concerning his company so as to be readily available to the newspaper men should any question arise on which an expression of opinion might be desired by the papers from some one in authority in the company.

The *Interborough Bulletin* was started less than four years ago. It is a paper of and for the employees of the company, and is distributed free. The circulation is about 18,500, and its appearance is eagerly awaited by the employees. Besides the circulation which it has among the employees, it is sent to a large mailing list of technical papers, magazine editors, city editors and others. It is delivered to subway employees at the Brooklyn Bridge station and to elevated railway employees at South Ferry. A superintendent leaves the necessary supply at the station and also delivers copies at the shops, power houses, etc. In each of the six recreation rooms of the Interborough Rapid Transit Company 500 copies of the bulletin are delivered. The *Bulletin* was such a success that after the sale and reorganization of the old Metropolitan Street Railway, controlling the surface lines, a similar publication was started for the employees of the successor company. This is called the *New York Railways Employees' Magazine*. It has a circulation of 8500 copies. The first issue was in May of the present year. The matter for these magazines is furnished mostly by the men, and information is collected by the chief clerks of the different departments, who send it to Mr. Waugh at the information bureau.

In the employees' magazines of both subsidiary companies explanations are made to the employees of criticisms of the companies which have appeared in the public press. Marked copies containing such explanations are sent to city editors. Some of the material in each issue of both magazines is also written with the special end in view of explaining some particular phase of the companies' work, and many of these articles, written by department heads or prepared from information supplied by such officers, have been reproduced *in toto* by the daily newspapers.

THE PUBLIC SERVICE RAILWAY

The fundamental principle of the work done by the publicity department of the Public Service Railway of New Jersey is simplicity. The work is in charge of J. L. O'Toole, who was for many years a newspaper editor on that effective paper, the Newark *Evening News*. In his present work Mr. O'Toole endeavors to put himself in the editor's place again and to supply only the kind of information which he as an editor would have "hunted down" as news. His ambition is to be considered by the editorial staffs of the newspapers in his district as one of themselves and to convince them that they can depend upon the authenticity of the news which he furnishes. If they want information on a subject not ripe for public discussion, he prefers to tell them so frankly rather than to give out ambiguous and misleading statements.

When a city editor Mr. O'Toole was disgusted by the vast amount of "stuff" with which editors are deluged and which is prepared to serve the purpose of the writers, regardless of the style and character desired by the publishers of the papers. He realized that discreetly prepared copy would be conspicuous through its rarity, and if the supply from one source was not too voluminous its welcome would not be worn out. This vital fact underlies all of the company's publicity work. Another important principle is that, to have news value, items must relate to local territory and conditions. Hence the characteristics of the different localities in which the company operates are studied, and news items are prepared to have local interest.

In order that the publicity department may have inside information as to the occurrences of interest, Mr. O'Toole attends conferences when important matters are discussed. He thus becomes a general center of information. This fact is appreciated not only by the newspapers but by the general public as well, as is indicated by the invitations which Mr. O'Toole receives to address associations of one sort and another, amounting to four or five a month during the winter season.

The Public Service Railway issues no periodical for employees at present, although projects for this purpose have been considered. The amount of printed matter distributed is not very large, the public being reached principally through the news columns of the papers, advertisements being sometimes, but not often, employed. The company gets a great deal of very desirable publicity through its safety crusade, and will get more in the future through a film, recently released by the Edison Company, which was prepared through the co-operation of the film company and the Public Service Railway Company.

THE PENNSYLVANIA RAILROAD

The fundamental ideas underlying the publicity work of the Pennsylvania Railroad are described in an article by Ivy L. Lee, executive assistant, printed elsewhere in this issue. In the practical working out of the policy based upon these principles different types of circulars and bulletins are issued to the press, the public and employees. Through the press announcements which can be given news value are circulated. In these circulars, statements such as the following are made:

"Difficulty has been experienced by railroad passengers from time to time in learning the causes of delays to trains on which they were traveling. In order to remove this source of irritation, the Pennsylvania Railroad has issued instructions to all conductors of passenger trains that when traffic is interrupted trainmen shall pass immediately through their trains and freely announce the conditions, advising passengers without reservation the reason for the delay, and, if necessary, the best means of proceeding on their journey.

"When a train is disabled at or near a station, trainmen are to notify the passengers as to cause and probable extent of the delay in order that they may continue on their journey, or return on an available train. If passengers desire to communicate with their friends from the station they are to be accorded promptly the use of the telephone or telegraph.

"Similar instructions have been given to station agents to post on their bulletin boards, or in other conspicuous places in their stations, a notice giving the location of whatever obstruction to traffic is taking place, the probable length of delay, and any other information in their possession, as to the cause and extent of the difficulty.

"The management of the Pennsylvania Railroad has for some years made public full details of accidents. It realizes, however, that passengers upon trains or passengers waiting at stations for the arrival or departure of trains, have a right to prompt information as to the cause and details of any delays which may take place either to the train on which they are traveling, or that for which they may be waiting. It also realizes that passengers should have every opportunity to allay unnecessary anxiety on the part of friends or families, due to train delays or accident."

The public is reached directly through station posters which are changed frequently. These not only state some definite points of vital interest to travelers, but they explain the reasons for the practices described. The announcements and the accompanying facts are therefore coupled and false impressions are thus avoided.

The most extensive circulation of facts to the newspapers is through the little magazine—*Information*—published at irregular intervals of about one week apart. In these a great deal is made of the human element referred to by Mr. Lee in his contributed article in this issue. *Information* is usually a 4-page leaflet, 6½ x 9 in. in size, printed and illustrated with great care. Each issue is devoted to a particular topic and there is a wide variety in the choice of topics, as is shown by the following titles: "He Risked His Life to Save Another," "The Railroad Roll of Honor," "Providing Increased Facilities for Handling Grain," "Pennsylvania Railroad System Owns Nearly 3000 Steel Cars," "87,000,000 Passengers on 680,000 Trains—All Safe," etc.

Especial attention is paid to retiring employees, portraits of the more prominent of whom are published.

THE NORTHERN OHIO TRACTION & LIGHT COMPANY

On the system of the Northern Ohio Traction & Light Company the general passenger agent, James A. Braden, is also manager of publicity, although the department was originally simply the advertising department. The chief activity of the department, after the regular advertising, is the publication twice each month of a four-page paper entitled the *Traction Bulletin*, of which 30,000 copies are printed at each issue. They are placed in small boxes in all city and interurban cars and passengers are invited to help themselves. Just before each number appears a poster is placed in car windows announcing the next number and date of issue, with a strong line calling attention to the chief article.

The work of the publicity department is handled by Mr. Braden, with the help of a stenographer and the co-operation of other employees, particularly for clerical work. The employees are reached by bulletins and circular letters through the safety department in charge of E. H. Clinedinst, safety supervisor. Aside from the *Traction Bulletin* the company reaches the general public by newspaper advertising and by posters announcing change of time or special events. The company depends primarily on the bulletin in connection with work on public relations, but furnishes the newspapers with matter calculated to work toward the same end. Photographs, cuts and text for the papers are prepared with the end in view of meeting the various newspaper requirements so far as it is possible to anticipate them. The experience of Mr. Braden in newspaper work, extending over ten or twelve years, has of course been of great value in this work. The company invites complaints and looks into them, answering promptly all letters. On one or two occasions Mr. Braden has improved opportunities to talk before local clubs on electric railway subjects. It is his opinion that the *Traction Bulletin* has been the most effective work the company has undertaken in the promotion of better relations with the public.

THE ILLINOIS TRACTION SYSTEM

This large interurban system has a fully organized department of publicity in charge of E. E. Soules, manager of publicity. Among the different lines of work which fall to the publicity department of this company are the following: Placing of all display advertising in newspapers and magazines, including the making of the necessary contracts; preparation of special articles from time to time when requested by publications for use in special editions, etc.; preparation of "news stories" on the subjects of equipment, extensions, change of schedule and service, changes in organizations and other such topics as are acceptable to a newspaper as desirable news matter; arranging copy, printing and distributing folders and time cards for the use of the public, and planning and executing various advertising campaigns that may be considered advisable from an operating and traffic standpoint.

Digging the Railroad Out of the Snow

The blizzard of March, 1914, crippled New Jersey railroads worse than any other storm in their history. It paralyzed the Main Line of the Pennsylvania Railroad between New York and Philadelphia — one of the busiest pieces of railroad in the world — for 24 hours.

87,000,000 Passengers on 680,000 Trains —All Safe

The lines of the Pennsylvania Railroad System carried 87,000,000 passengers in the six months between January 1 and July 1, 1914—and not one of them was killed in a train accident.

In the calendar year 1913 the Pennsylvania Railroad Lines East of Pittsburgh carried 108,000,000 passengers, and not one was killed in a train accident.

The Pennsylvania Railroad System has 11,729 miles of line and 26,198 miles of track. More than 113,000 passenger trains are operated on these tracks every month. This record of six months means the safe operation by day and by night, through fog, snow, storm and clear weather, of 680,000 passenger trains, while at the same time approximately as many more freight trains are being cared for.

On the Pennsylvania Lines East of Pittsburgh no passenger has been killed in a train accident since 1912. During this period these lines alone have carried more than 161,000,000 people without the loss of a passenger's life in a train accident.

* * * *

The Pennsylvania Management regards every accident of any kind as one too many. Every effort is being continually directed to the end that the number of accidents of all kinds may be steadily reduced and if possible prevented.

He Risked His Life to Save Another

James Irwin, Pilot of Pennsylvania Railroad ferryboat Wildwood, plying between Camden, N. J., and Philadelphia, jumped from the upper deck of his boat into the Delaware River and saved the life of a woman who had leaped into the river from another ferryboat. The following account of Mr. Irwin's heroic act is reprinted below from The Philadelphia Bulletin of March 19, 1914.

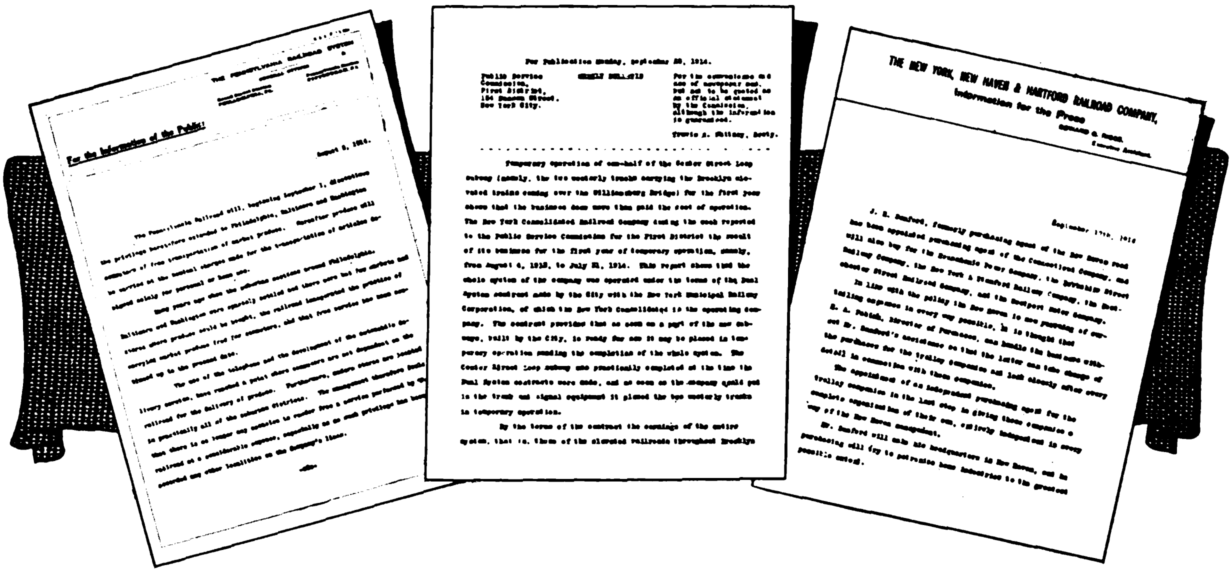
FRONT PAGES OF THREE INFORMATION CIRCULARS OF THE PENNSYLVANIA RAILROAD

The manager of publicity reports to the vice-president executive and general manager of the company. Every agent or representative of the company is considered an assistant to the publicity manager, for it often happens that the local representative, acting in co-operation with the publicity department, can be of great assistance in handling the publicity problems in his particular territory.

Mr. Soules finds that the methods to be employed in reaching the general public for the purpose of stimulating traffic depend largely upon the local situation. For instance, the territory served by the company is not so well supplied with summer resorts as are many of the Northern and Eastern electric properties and it is a case, therefore, of keeping up the every-day travel, with the exception of inducements that may be offered in the shape of excursions into some of the larger cities on the lines, such as St. Louis, Mo.; Peoria, Ill.; Springfield, Ill., and other points.

The experience of the company has been that the daily and weekly newspapers are the best mediums for reaching the public with the story of an excursion rate or special attraction, and a large amount of newspaper display advertising is used for this purpose, supplemented with the usual window cards and "fliers" in interurban cars. The advantage of the newspaper is that, in connection with the display advertising, the excursion or attraction is usually given notice in the news columns. Recently the motion-picture playhouse has opened up a valuable medium for reaching a class of people likely to patronize the excursion, and this medium has been used to a considerable extent with the display of artistic curtain slides in "picture" and vaudeville houses. The slides tell concisely the story that it is desired to convey to prospective patrons of the road. This department and the traffic department co-operate to a considerable extent with organizations giving excursions on the company's lines, in the advertising of such movements.

The company has found that newspapers consider "feature" stories on the subject of interurban operation as desirable matter for their columns, and some time ago a newspaper supplement was prepared by this company and offered to newspapers in its territory. It was eagerly accepted, and two other supplements have since been issued. The last one was put up in magazine style, containing twenty-four pages of reading matter and illustrated with cuts of street scenes in cities served, views along the line, pictures of equipment, track scenes, terminals, etc. The supplement had as its basic theme the story of the advance in the use of electricity in the transportation world in the last ten years, and contained a number of original articles written by officers of commercial organizations in cities along the lines of the company on the subject of "The Advantages of an Interurban Railway to a City." It also contained articles depicting the resources of the various cities and communities along the lines of this company, and the principal daily and weekly newspapers considered it a desirable addition to their regular editions. Where desired a page was donated to the newspaper for its own advertisement or to the commercial organization for an advertisement of the city itself.



MIMEOGRAPH AND PRINTED NEWS BULLETINS OF THE PENNSYLVANIA RAILROAD, THE PUBLIC SERVICE COMMISSION OF NEW YORK AND THE NEW HAVEN RAILROAD

This company has from time to time taken the public into its confidence in various ways. For instance, in connection with the annual State fair which is held in Springfield, Ill., an important point on the system, patrons were asked to make suggestions for the improvement of service. Each passenger traveling into Springfield on the company's lines during the fair was entitled to make a suggestion by depositing a slip in a ballot box located in the company building at the fair, and prizes were offered for the best suggestions. A number of valuable suggestions were received, and the plan attracted considerable attention.

A "phrase" contest was also conducted in connection with the State fair. Prizes were awarded for the best three phrases containing three words beginning consecutively with the letters "I," "T," "S." Nearly four hundred suggestions were received and a committee of newspaper men awarded the prizes. The first prize was awarded for "Ideal Train Service," and this phrase has since been used to a considerable extent in company advertising.

In connection with the State fair this company also conducts an information bureau on the fair grounds and, in addition to supplying information in regard to railway connections, details of the fair, etc., an opportunity is afforded for a large amount of advertising.

When sleeping and parlor-car service was established on the system the first car to be put in operation was sent on a trip over the lines and placed on exhibition at each city and town. At the time block signals were first installed, full-sized models were exhibited on the street corners in the principal cities and the operation of the mechanism was demonstrated.

In the "playing up" of construction and development work this company affords every facility possible to the newspaper man. This kind of information is considered "live stuff" by the news departments of the city paper, and assistance in securing such information is appreciated by the working newspaper man. From time to time groups of newspaper men have been taken over the lines for the purpose of allowing them to see new construction work and development of the properties and to give them an idea of the operation of the system. Photographs and in many cases cuts are supplied where desired.

Folders and time-tables are distributed direct to agents from the publicity department of this company, and agents are required to see that stocks are well kept up. Requisition for folders is made direct to this department and when a supply is sent out it is accompanied by a slip stating the number of folders forwarded, date, etc. A receipt is attached which the agent fills out and returns to the publicity office indicating that he has received the shipment. An arrangement with a distributing company provides for a supply of folders to all hotels. In addition to folders this company issues a "terminal time card" for the principal points on its lines, which gives briefly the arriving and departing time of all trains and other information in regard to connections, etc. These are displayed in hotels and public places. In distributing other advertising matter where the services of a professional distributer are required, the assistance of the local agent is depended upon. Advertising matter of this kind is sent to the local agent and the distributer is instructed to call on the agent for it. The agent is then supposed to check up on the distribution and report back to the publicity department.

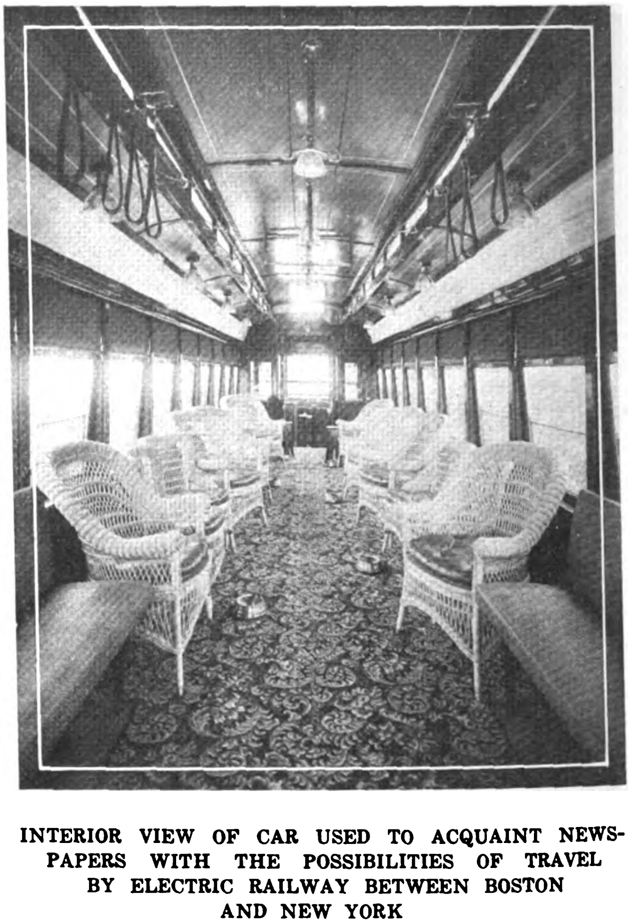
MAP OF ROUTE FOLLOWED TO ACQUAINT NEWSPAPERS WITH THE POSSIBILITIES OF TRAVEL BY ELECTRIC RAILWAY BETWEEN BOSTON AND NEW YORK

A 350-MILE CITY AND INTERURBAN SYSTEM

The head of the publicity department of a large city and interurban system has supplied information regarding the publicity work of his company. On this system the publicity department was created in 1911. Its work consists in keeping the company management fully informed as to articles appearing in the press throughout its territory which, directly or indirectly, affect its interests; giving such information to the press as may be deemed advisable concerning the company's policy or undertakings, and controlling the company advertising.

The reporters of the daily papers call or telephone to the publicity department every day for items and always receive courteous treatment. The effort is made to see that nothing except correct information concerning matters with which the company is connected appears in the newspapers. This work has been accomplished well, as the city editors know that the publicity man is at their service, day or night, to assist them in every way to secure an accurate account of the subject under consideration. Copies of "hand out" articles are sent to all publications of similar class. Where a publication asks for information on a special subject, the facts are reserved exclusively for it. By strictly observing well-framed rules as to the giving out of information the company has been spared attacks arising because of the rivalry of local publications.

In the matter of public relations, reliance is placed chiefly on news items and paragraphs supplied to reporters as they call. Extended articles are also prepared for the press, as needs demand, and put into the form of "time copy" material for the magazines covering the company's field. Last year a series of traffic talks was prepared and appeared in the company's regular advertising space with good effect. The opinion of the publicity manager of the company is that such talks should appear in serial form so as to keep up a day-to-day interest, rather than as longer advertisements published spasmodically. The company's development work is played up in every possible way and the reporters are supplied with data, photos, etc., ac-



INTERIOR VIEW OF CAR USED TO ACQUAINT NEWSPAPERS WITH THE POSSIBILITIES OF TRAVEL BY ELECTRIC RAILWAY BETWEEN BOSTON AND NEW YORK cording to their requirements. Every facility is afforded to newspaper men who desire personally to visit the scene of any operations which are being carried on by the company.

Efforts are made to stimulate traffic through advertisements in the daily press. All attractions, whether of a public or private character, are advertised if they are likely to create traffic. For attractions running at fixed times throughout an entire season special folders are prepared and sent out with the company's lighting bills. Considerable publicity regarding special attractions is also obtained through news paragraphs and articles prepared along lines of indirect appeal. During the summer season the company usually issues folders suited to the demands of tourists. Where the probable return would seem to warrant the expenditure special folders are prepared to cover special excursions. These folders are distributed through hotel racks in the centers of traffic.

In the line of advertising the newspapers are supplied with fresh copy according to existing conditions. Copy for the daily papers is generally changed every day, and for the weeklies it is changed according to circumstances. In this work close touch is kept with the various departments of the company, and every advertisement is framed in such a manner as to make it likely that the company will, directly or indirectly, reap some benefit, financial or otherwise, as a result of its appearance. All publications of a similar class are treated in the same manner as to advertising space, and extra space taken in one is also taken in others of the same class.

All advertising propositions are classified under their respective headings, and a definite policy is established regarding each class. All applications from any one class are similarly treated as to rejection or consideration. By putting up the barrier of a definite policy regarding rejection, and showing the advertising canvasser that his proposition and every other of his class are being treated alike, the work has been greatly simplified. In short, the criterion adopted on this property regarding public service advertising is one of freeing the advertising appropriations from the burden of payments authorized because of sentiment. Where such expenditures are deemed necessary, they are placed under their proper classification of donations or grants.

The department is under the charge of the publicity agent who acts directly under the general manager. Its staff consists at present of the publicity agent, a clerk who takes charge of the clipping system, indexing, etc., a stenographer and an office boy, who assists in the work of handling the clippings. The "clipping" system covers all publications within the company's territory. Every morning a letter is sent to the chief officials containing a digest of each clipping. This makes it possible for incorrect or misleading statements covering the work of any department to be corrected promptly. The clippings are pasted on loose leaf sheets, indexed by card system and are filed permanently in the publicity agent's office for reference. The office also scans the periodicals and technical journals dealing with the business which the company carries on and memoranda of paragraphs or articles are sent to the departmental heads as the demand arises.

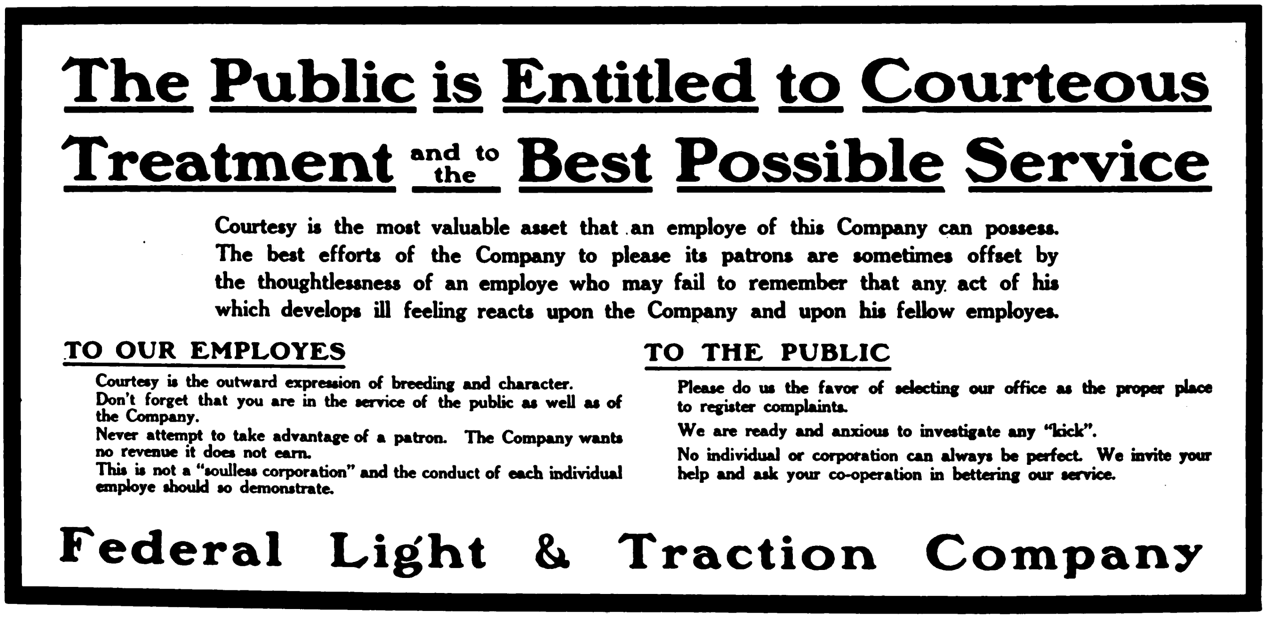
CAR USED IN THE TRIP TO ACQUAINT NEWSPAPER MEN WITH POSSIBILITIES OF TRAVEL BY ELECTRIC RAILWAY BETWEEN BOSTON AND NEW YORK

THE ATTITUDE OF THE NEWSPAPERS TOWARD PUBLIC UTILITY PUBLICITY

In connection with the account of the ways in which the utilities keep in touch with the newspapers it will be interesting to have the viewpoint of the newspapers in regard to public utility publicity. To secure this from one newspaper editor the ELECTRIC RAILWAY JOURNAL requested an interview with Fred G. Buffe, secretary-treasurer of the Peoria (Ill.) *Herald-Transcript*. Mr. Buffe has had experience with public utility publicity, both from the standpoint of the railway and that of the newspaper, having formerly been connected with the Illinois Traction System, and so has had exceptional opportunities for seeing both sides of the question.

Mr. Buffe commenced by quoting an editor of a great newspaper who said that anything that affected the streets was good news. The streets were the arteries of the city for the common good of all the citizens, and anything that assisted or interfered with rapid communication and transportion was front-page "stuff." This is true also of water, gas and light, because on these depends the comfort of the average citizen. Mr. Buffe considers that public utility news as a general thing, therefore, is good copy. The people are interested in anything that influences their comfort and convenience. They are pleased to read of improvements being made, whether by the utility company or the department store. The extension of a car line is as interesting to the people of the city as the building of John Jones' new barn is to the village.



The Public is Entitled to Courteous Treatment and to the Best Possible Service

Courtesy is the most valuable asset that an employe of this Company can possess. The best efforts of the Company to please its patrons are sometimes offset by the thoughtlessness of an employe who may fail to remember that any act of his which develops ill feeling reacts upon the Company and upon his fellow employes.

TO OUR EMPLOYES

Courtesy is the outward expression of breeding and character.
Don't forget that you are in the service of the public as well as of the Company.
Never attempt to take advantage of a patron. The Company wants no revenue it does not earn.
This is not a "soulless corporation" and the conduct of each individual employe should so demonstrate.

TO THE PUBLIC

Please do us the favor of selecting our office as the proper place to register complaints.
We are ready and anxious to investigate any "kick".
No individual or corporation can always be perfect. We invite your help and ask your co-operation in bettering our service.

Federal Light & Traction Company

CARD ON COURTESY DESIGNED TO BETTER PUBLIC RELATIONS

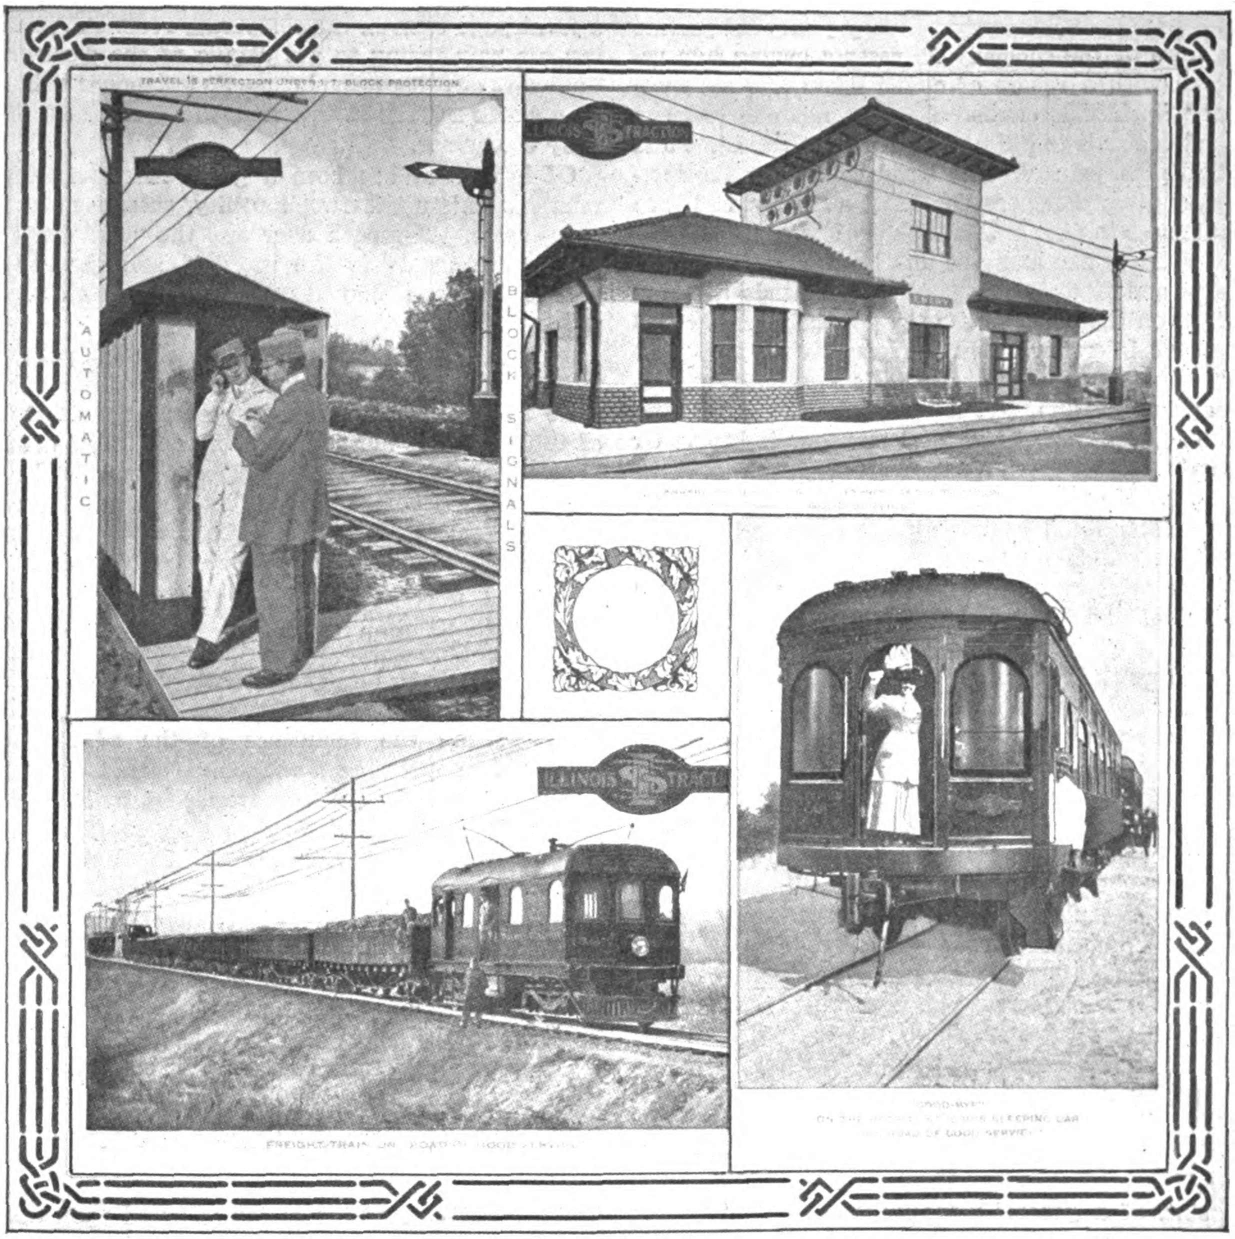
The way in which an editor looks upon public utility publicity varies with different varieties of editors and different types of utilities and utility executives. If the point of view were reversed and the attitude of the public utility toward the editor investigated, the conditions would be about the same. If two and three make five so do three and two; likewise one is paid in the same coin that he gives. Whether a company is "a myriad-headed octopus sucking the life blood of the community," or "a highly efficient, up-to-date, capably managed, soundly financed institution" is in a great measure determined by the man who heads the payroll of the company.

It is safe to say that the attitude of the editor toward public utility publicity is the same as it is toward that of the street-cleaning department, the police station, the circuit court or any other source of news. He is paid to see that what happens in his town that is news is gathered, well written up and printed. If the public utility has legitimate news he will print it. Of course, in many cities, extraneous things enter the relationship, and influences outside the editor's control are determining factors. It may be that the company and the publisher are at outs, or that the paper is allied with a city administration or a political organization which makes political capital by "lambasting" the public utility. It may be that because of past misdeeds or poor service, public sentiment has crystallized against the company. In that event this sentiment may be shared, reflected or even fostered by the newspaper. But these are special cases, for, in a city where the relations are neutral and where there is no political bias, the editor—the man in charge of the news end of the paper—will approach public utility publicity with an unprejudiced mind. If he is treated fairly he will be willing to give the company more than an even break in the news.

This subject brings in labor and franchise matters, according to Mr. Buffe. For a newspaper these are dangerous questions and have to be handled with gloves. The news must be carefully edited and written without bias. An editor cannot be expected to jeopardize the success of his paper and his position by espousing the cause of a public utility company. But unless the policy of the paper is partisan he will be willing, if treated courteously and given the facts, to print them fairly.

The editor, contrary to the frequently expressed opinion, is quite human. It may be that long experience with hypocrisy has made him cynical or that his dealings with press agents have made him prone to "examine the band on the gift cigar," but, as a matter of fact, his human qualities are generally uppermost. He is engaged in the absorbing occupation of giving the people what they think they want, and his waking hours are spent in quest of news. He is glad to welcome facts, but views "bunk" with "a cold and clammy eye." He resents having anyone attempt to put something over on him with the "gold brick" of free advertising. While the editor is supposed to be divorced from the business department he is aware of the source of his salary and does not feel at all unfriendly if now and then he observes utility publicity in the display advertising.

The public utility manager must put himself in



TRAVEL IS PERFECTION UNDER I. T. BLOCK PROTECTION

ROAD OF GOOD SERVICE

FOUR OF THE PICTURE POSTCARDS DISTRIBUTED BY THE ILLINOIS TRACTION SYSTEM TO AFFORD ITS PATRONS AN EASY MEANS OF "WRITING HOME" the editor's place. Assume, for example, that some news has leaked out that the manager would prefer not to see in print. If the "tip" is in the newspaper office it will appear, but the manner and form of its appearance is largely up to the manager. The editor is a pretty busy individual. He is trying to make the "deadline." When the editor sends an inquiring pest of a reporter to pry into the private affairs of the company he resents having him return with a report of closed doors and stubborn and implacable clerks. He does not like requests and demands to kill news when it is legitimate and should be printed. His blood boils when the company gives the opposition sheet a "scoop" and then attempts to placate him with excuses and apologies.

Perhaps like many editors he is cursed with too few and inefficient reporters. He sends a young man on the jump to see the general manager and get an interview. So the reporter makes haste to the general office where he finds a secretary guarding the sanctum. He is told that there is "nothing doing," or that the general manager is busy. Or perhaps he is given a manifolded typewritten statement. He fails to reach the "Presence," does not get the story, and returns to his office sore, mad and disgusted. When he reports, the editor says, "We can't print excuses. Write what you have for a 'follow' and I'll write the 'lead.' I'll bet the big stiff sees the next man I send over." And a big black mark is chalked up against that general manager in the mind of everybody from the editor to the office boy. And red-headed office boys seldom forgive and never forget.

The reporter isn't like the supply salesman. He cannot wait when the general manager is busy. The hands of the clock are racing to press-time, and neither time nor the press will wait on the manager's pleasure or convenience. No matter what the business of the moment may be he should see the reporter and be pleasant. It may be an annoyance to interrupt an important conference to interview a reporter, but it should be done by all means and at once. By so doing the manager is creating a correct attitude of the editor toward the railway property and also the attitude of future editors.

Mr. Buffe enjoys telling a story, much to the point, of a general manager who is liked by the newspaper men in three states. He has the newspaper instinct highly developed. One stormy night in winter one of his cars made a skating rink out of the track and banged into a loaded car ahead, smashing windows and injuring several passengers. The editor of the morning paper, who was a good friend, called up the manager and asked him about the story and halfway apologized for having to use it. "You print the news, that's your business," was the reply. "I'll call the superintendent and have him send someone up with the names and the facts."

This same manager, on the occasion of a disastrous wreck on his interurban line, loaded his private car with newspaper men, picking them up along the line, put the company telephone at their service and gave them every facility to get the news. He was able to put himself in the place of the fellow at the copy desk, 50 miles away, holding a front page open in the composing room and tearing his hair trying to get details of the disaster. That sort of thing helped make an attitude that has been worth a lot in favorable publicity for his company ever since.

Of late there has been a great change in the relations existing between utility executives and newspapers. The open door and the "glad hand" are now elements in the accepted and generally practiced policy, and excellent results naturally follow.

To facilitate the working out of this policy, public utilities should have certain officials who come in contact with the newspaper men as part of their duties. Most utilities now have publicity departments, and, properly handled, these should be among the most valuable cogs in the machinery of the organization. They should be in charge of men with newspaper experience, whose duties should not be merely those of the "press agent." In fact, nothing is so certain to make the editor unfriendly, for he has been afflicted with this gentry for years and views their inspired utterances with much suspicion.

By getting the confidence of the editor, by making him understand that there is no disposition to grab free space for advertising, by showing him that the company desires only to give him legitimate news, the head of a publicity department can make himself a welcome visitor in the editor's office.

Like the public utility, the newspaper depends for its success upon service. Every day it has so many columns of reading matter to fill, and its readers are entitled to these columns with the most interesting and attractive matter it is possible to put together. The advertisers pay for the display columns, but the news end is paid for by the subscribers. The public utility office should be a good news center. And the management will find that the attitude of the editor is based upon this fact if he is given half a chance. The public utility serving the public should have little difficulty informing the public of changes and improvements in that service through the medium of the newspaper, the duty of which is to print the news.

In general, then, Mr. Buffe believes that the attitude of the editor is but a reflection of the attitude of the utility, and mutual understanding and helpfulness will exist if consideration is given to the requests and to the work of the gentleman with the blue pencil.

Electric Railway Journal

Published by the McGraw Publishing Company, Inc.
Consolidation of Street Railway Journal and Electric Railway Review

Vol. XLIV NEW YORK, SATURDAY, OCTOBER 10, 1914 No. 15

RAMIFICATIONS OF SAFETY WORK

The article in this issue describing the lines of activity of the safety department of the Public Service Railway suggests the extent to which it is possible for this movement to go. There is practically no resistance to its expansion, and the only limit seems to be set by the appropriation which the railway company feels justified in making for the work. The returns for the expenditure are difficult to measure in dollars and cents. In this the safety movement is like advertising. We know instinctively that it is a good thing and that, up to a certain extent, it will pay good returns. Just what this extent is cannot be scientifically determined, but we can be sure of a good return on all of the money that a railway is likely to spend on the movement. At the moment the safety movement has caught the public fancy. It fits in well also with a number of civic movements. It is well that the electric railway industry, being an inherently hazardous one, should make the most of its opportunity and should keep up the good work. The electric railways will thus take their places as leaders in their respective communities and will reap a direct reward in reduced accident costs.

ASSISTANCE FROM THE HOME GUARD

The attendance at the Atlantic City convention will be large, but necessarily a larger body of men must remain at home to keep the wheels going round. Many of those best qualified to take part in the discussion of papers and reports cannot break away. They can be represented, however, if the remarks which they would have spoken if at the convention are sent to the secretary by mail either this week or early next week. It is possible that all of these compositions cannot be read at the convention, but undoubtedly most of them can be, and in any event they will enrich the printed proceedings. Chairmen are always glad to have ammunition in reserve ready for use at some juncture when verbal manifestations of interest lag. Written contributions are second only in value to spoken ones, and often they are better, for many men can write better than they can speak. This should, however, not be taken as an excuse for staying at home, for there are reasons for coming to the convention other than to increase the volume of eloquence. The preprints of many of the reports and papers were distributed so early this year that there has been ample opportunity to study them. A large crop of written contributions would furnish good evidence that they have been studied.

A MEANS OF ECONOMY

If we think of the convention principally as a means for securing greater efficiency in the operation of individual companies, as it undoubtedly is, any question as to the desirability of a member-company being represented at Atlantic City this year disappears. This is a time when many, indeed most, railways are enforcing systems of strict economy. The need for this has been accentuated by the financial stringency resulting from the war, and stern efforts are being made on most properties to keep all expenses down to the minimum. This is entirely proper, but expenses may be cut so close as to defeat the object sought. With the five associations which will meet at Atlantic City and the opportunities afforded there for comparing notes and getting new ideas, more than enough benefit should be derived from the meeting, in suggestions for practical economies, to pay the expenses for a good delegation from each member-company. It should be remembered that these meetings occur but once a year. It seems that at least once during that length of time the accountant, the engineer, the claim agent and the transportation manager on every electric railway could gain enough advantage from discussing their problems with the corresponding officials on other properties to warrant their being sent to attend such a gathering. This argument for attendance at the convention is based purely on the self-interest of the individual railway concerned, the only question being the most effective way of saving money in the long run.

VALUE OF INDUSTRIAL SIDINGS

The value of a side track connecting an industrial plant with a main line is obvious, and it is a question if any other single agency is so potent a factor in cutting the cost of handling manufactured products and raw material between the stock room and the railroad. The development of electric freight and express business has in many localities dated in a large way from the use of side tracks which entirely eliminated the obstructions and sanitary inconvenience of teams, saved labor formerly devoted to costly rehandling, and insured prompt shipments of both perishable and durable material. Unfortunately local municipal authorities are sometimes slow to appreciate the convenience and desirability of electric railway sidings as compared with steam-railroad private tracks which cross sidewalks and streets at grade. Something may very properly be said against permitting the indiscriminate use of steam locomotives on the public highways, but very little objection is tenable relative to the handling of freight and express in and out of such industrial plants by electric cars or locomotives. To cite a typical case now pending, an electric railway company desires to build a side track in connection with the erection of a new creamery whose owners are prepared to expend about $30,000 to secure a model plant. In order to make the site available, the siding must cross the sidewalk at grade. The daily traffic amounts to about 9000 quarts of milk at present, and this can be handled by a single car. However, it appears that if the siding is not installed, the product of the farms must be brought into the plant by several motor truck trips each day, and at a public hearing on the company's petition the point was well made that one or two car movements a day across the sidewalk would constitute a far smaller hazard to pedestrians and children than would the automobile truck service. The matter is, of course, one of mainly local interest, but it suggests the greater fitness of the electric railway for handling such traffic and has some general significance thereby. On the grounds of cleanliness, restriction of route, minimum number of movements for a given load, and quiet effectiveness, to say nothing of economical transportation, the electric railway is much superior to its gasoline competitor. When it has a fair chance to show its merits in districts of the distinctly wholesale or manufacturing type a trolley express and freight service with industrial sidings meets a need which should be generally recognized by public authorities.

MONOGRAPHS IN COMMITTEE REPORTS

Recent years have developed a decided departure from the practice of having convention papers or reports prepared by individuals, at least so far as the larger technical questions of the electric railway industry are concerned. The committee method now in vogue has much in its favor, for it facilitates the collection of data, and the deductions from such data are based on a greater fund of experiences than any one man, no matter how expert, could be expected to possess. Furthermore, the danger of a colorless compromise in harmonizing the divergent views of committee members is much less than the acceptance of conclusions which embody the unchecked bias of one man.

While such matters as the selection of standards, forms of specifications and analyses of data sheets are best handled by committees, it is evident from the reports this year that very good supplementary work has been done by individuals in the form of monographs on matters which are of great present interest but do not call for committee work as a whole. One of these monographs, for example, is that by L. M. Clark, who describes in the report of the committee on equipment, Engineering Association, the wonderful advances recently made in more economical and better distributed car lighting. Much information of this character has already appeared in the technical press, but necessarily in fragmentary form, while the monograph marshals all the important facts to date in most convenient fashion. Thus the association member is really presented with an up-to-the-moment handbook as only one of many membership benefits. Among other monographs in committee reports are those given as appendices by the committee on power generation, Engineering Association. They are as follows: "Status of Automatic Stokers," by J. S. Pigott; "Control and Safety Devices for Power Stations and Feeder Circuits with Special Reference to Reactance," by J. W. Welsh and Fay Woodmansee, and "Advantages and Disadvantages of Sixty-Cycle Apparatus with Particular Reference to Rotary Converters for Railway Service," by L. P. Crecelius and W. H. Sawyer.

Aside from these signed monographs, other committee reports will be found to contain similar supplements which are apparently the work of individuals and form most readable and instructive statements of advances in the art.

MOTION TIME STUDY OF FREIGHT HANDLING

It seems somewhat strange at first thought that an efficiency study of a steam railroad freight terminal should be undertaken by a corps of electrical engineers. Yet the principles of engineering analysis are the same in electrical as in other branches of engineering, so that the selection of Professor Pender and several of his associates at the Massachusetts Institute of Technology to study the Boston freight terminal station is not really illogical. Professor Pender's conclusions, presented in a paper before the New York Railroad Club recently, are naturally of primary interest to the steam roads concerned, but the unusual process itself of applying motion time studies to freight handling will appeal to electric railways as well.

In a study of freight-handling methods on interurban electric railways published in our 1913 convention number, we noted the congested conditions as a rule existing in freight terminals. The central location of such terminals in limited areas on account of high land values has generally caused freight congestion. The margin of profit under present rates does not warrant extensive freight terminals. In fact, several electric interurban railways have been forced to stop the solicitation of less-than-carload freight simply because the cost of the needed extensions was too great. Under such conditions a motion time study of the handling methods in order to eliminate lost motion is advisable in order to secure the complete utilization of the property already owned. The principles used in Boston are applicable to electric railway freight terminals, whether large or small, and the success of the investment there may well lead many electric railway managers to resort to such means before authorizing expenditures for enlarging congested terminals.

The percentages obtained in Boston are not intrinsically valuable to electric railways, of course, but they do indicate the lines along which time may be saved in handling freight. An analysis of the total time spent by wagons in the freight yard showed that 6 per cent was taken up by inquiries at the cashier's office, 9 per cent in searching for freight, 15 per cent at the freight-house door, 7 per cent in loafing and 35 per cent in loading and unloading. It was concluded that the time required at the cashier's office could be reduced 40 per cent by employing more accurate methods in handling delivery checks. The time necessary for finding freight, including calls without load, could be reduced 60 per cent by grouping consignments and keeping identification marks in view.

In an analysis of the time between the arrival of trains and the delivery of freight, the most interesting point was the time interval between the making of delivery checks and the removal of freight. At one freight terminal the average delivery time was about eighteen hours after the beginning of the free storage period of seventy-two hours. Only 55 per cent of the freight was removed on the day of the first notice. There seems to be no remedy for this abuse of the storage privilege except through the establishment of a store door delivery. Another point especially interesting to electric railways was the inefficiency of the average loads of less-than-carload freight. The low tonnage on some divisions represented only 20 per cent of the normal capacity of the cars. When the high cost of handling the unused equipment is compared to the time and expense of concentrating the shipments in only the cars actually needed, the opportunity for saving on this item will be seen.

OUR CONVENTION ISSUE

We believe that we do not owe our readers an apology for the selection of the subject of public relations for our convention issue this year. As President Black says, it is the paramount question to-day before the electric railways of the country. Indeed, it underlies their financial existence. The reason for this is that the electric railway industry is undergoing a process of change so far as its relations with the public are concerned. This change began some ten years ago with the establishment of public service commissions with broad powers of supervision and regulation. It has been hastened by many economic factors, among which the increased cost of operation is probably the most important.

The consequence has been that the electric railway has ceased to be an enterprise largely private in its character, subject only to such limits as apply to mercantile enterprises and liable also to the hazards of those enterprises. Instead, it has become very similar in character to a public undertaking. The service is being regulated in the interests of the public, and the belief is general now that these companies should be protected in their investments against competition, like other public enterprises. The only difference is that they are managed and owned privately and not publicly. These conditions have introduced important questions in connection with the subject of regulation and rates. These questions are acute in cities where the franchises have expired or are about to expire, but they are also the cause of considerable concern even for those companies which are operating under perpetual franchises.

The subject of public relations naturally divides itself into three parts—namely the proper attitude of the companies and the public toward each other, the improvements possible in operating conditions and the broad question of regulation. These are the main divisions of the contributed articles in our convention number. We do not intend here to review the different articles in that number. The authors speak for themselves in better and more convincing language than we command; but it might be well to touch briefly upon the general conclusions reached.

No one can read the articles in the convention issue without being impressed with the fact that the managements of our electric railway companies realize to the fullest degree the importance of establishing the proper kind of relations with the public which they serve. They must not only keep their service up to the proper standard, but they must give full publicity to their accounts and actions and let the public know what they are doing. They must be prepared to receive criticisms and complaints graciously and to show that they are ready, within their ability, to improve any conditions of which legitimate complaint is made.

This attitude does not mean the sacrifice of dignity or of any right possessed by a public utility. Where advantage is taken by the public of this attitude to extort unreasonable privileges, or in case of other oppression, the electric railways should not hesitate to explain their position clearly and definitely and to defend it, and if they have established a reputation for fair dealing with the public they should expect and demand equally fair treatment in return.

The question of the proper character of regulation is a basic one in any consideration of the relation of public utility companies to the public. Granted government regulation, the first questions to be determined are whether there should be state or municipal regulation and the proper qualifications and powers of the regulators. Another question closely allied with this is that of the most desirable form of franchise for a public utility company. On this point we consider ourselves fortunate in being able to present to our readers a number of most interesting discussions, including a series of articles on the subject of partnership relations. This series discusses in detail the partnership arrangements in four cities in which this plan has been adopted or proposed, namely, Chicago, New York, Kansas City and Philadelphia. Other articles in this section discuss the functions and powers of commissions and the importance which the questions of valuation possess in connection with railroad properties. In conclusion an article describes methods and policies of public utility publicity from various standpoints.

We believe that our readers are greatly indebted to all of the gentlemen who have contributed their thoughts to this symposium and that their statements will be of great assistance to the industry, as they should help to secure that great desideratum at present —a better condition of public relations for the public utility companies.

New Shops and Carhouse of the Atlantic City & Shore Railroad

These Recently Completed Shops Show the Influence of the Experience of Steam Railroad Engineers in Shop Layout as Applied to Electric Railway Conditions—Owing to Local Conditions the Shops Have Been Made Remarkably Complete, Considering the Size of the Road

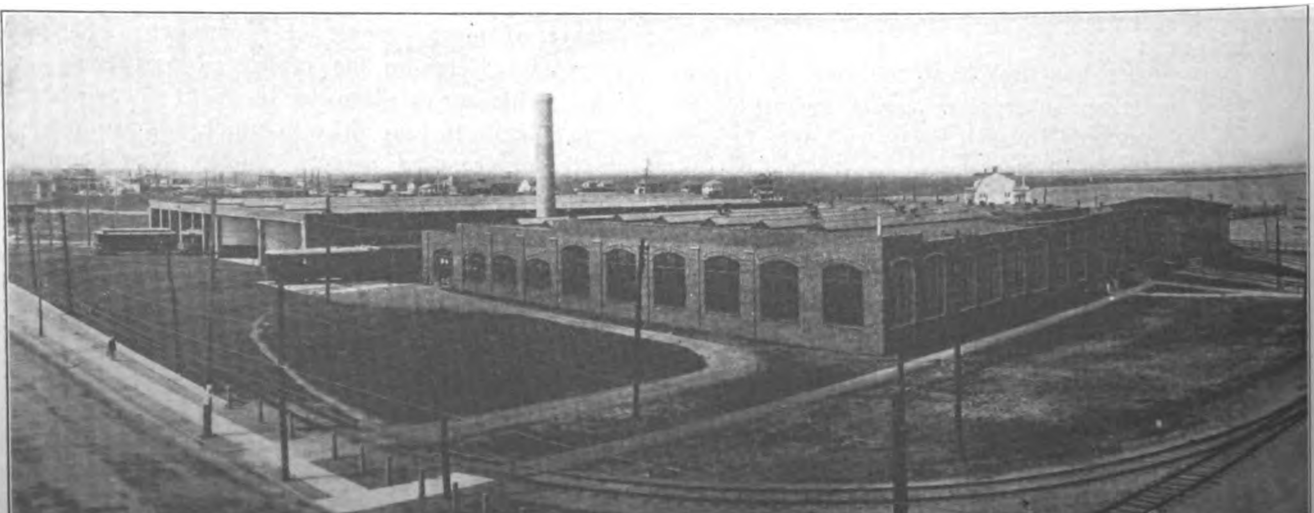
The accompanying diagrams and illustrations tell an interesting story of the shops and carhouse just completed at Atlantic City, N. J. The system of the Atlantic City & Shore Railroad is probably one of the best known to electric railway men in this country because Atlantic City is most frequently selected for the meetings of the American Electric Railway Association. The new shops, carhouse and office building, together with the site, represent an investment of about $250,000. They contain provision for adequate maintenance and storage of the present rolling stock and for a considerable increase. They were built by the West Jersey & Seashore Railroad under the lease of their property to the local company, and suitable charges will be made to several underlying companies for their shares of the operating costs and overhead charges on a car-mileage basis. Before taking up details of the special features of the building and general plan, a brief summary of the organization and equipment of the company will be made to give the reader data for analysis beyond the scope of the present article.

The company operates 48 1/3 miles of single track in Atlantic City and its environs, a line to Ocean City being the longest single section. The company also operates during the summer time a line of boats between Longport and Ocean City, having for this purpose an equipment of five steamers. The rolling stock comprises eighty-two passenger cars, of which about one-half are summer cars, four are combination baggage and passenger cars, one is a funeral car and six are miscellaneous service cars.

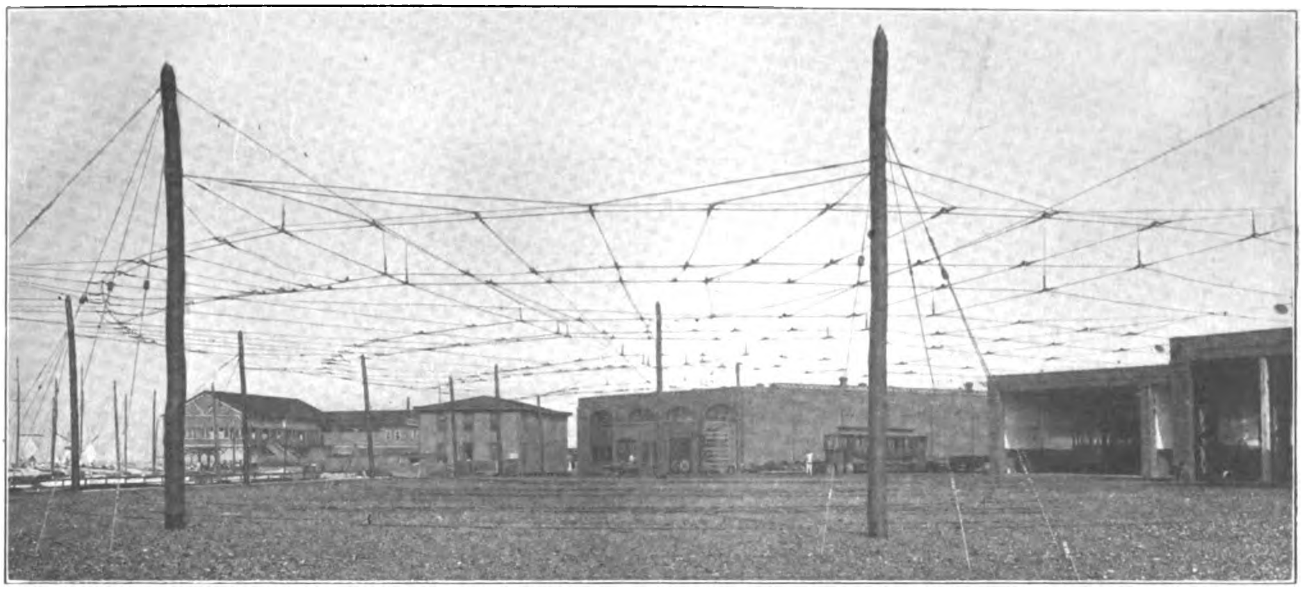
The organization of the Atlantic City & Shore Railroad is somewhat complicated due to the fact that the several underlying properties are still maintained intact. The Central Passenger Railway, over whose less than 2 miles of track an entrance into Atlantic City is secured, is the smallest. The Atlantic City & Shore Railroad has a right-of-way only over this track. It leases the Atlantic City and Longport track from the West Jersey & Seashore Railroad, and also part of the Newfield branch to Pleasantville. The railroad has also a traffic right over the double-track road from Pleasantville to Somer's Point, the second track having been built to meet the demands of traffic. The line from Somer's Point to Ocean City was built by a separately organized company known as the Atlantic City & Ocean City Railroad, which leased its track for 999 years to the Atlantic City & Shore Railroad. Separate sets of books of accounts for all these underlying railroads are maintained.

GENERAL LAYOUT OF THE PLANT

The new plant is at the extreme eastern end of the island upon which Atlantic City is located. Here the railroad was fortunate in owning a plot which, while not central with respect to the system, was accessible. In shape and size it was better adapted to its purposes than the old site farther downtown. By adaptation of the requirements to the new location, it was possible to utilize all of the area and to provide for the convenient handling of cars with a minimum of yard space. The general plan of the layout is shown in one of the accompanying illustrations. The shops are housed in two buildings, one containing the paint shop and the other the machine and wood shops and the boiler-room and sundry other small rooms. These two buildings are placed opposite, 52 ft. apart, with a transfer table 36 ft. wide between. The carhouse is detached from the shops and contains twelve tracks placed in four bays. Across one end of the transfer-table alley is the office building, in two floors, joining the shop building. This arrangement brings all the parts of the shops within easy reach of the officials located in the office building.



ATLANTIC CITY SHOPS—PANORAMIC VIEW OF SHOPS AND



ATLANTIC CITY SHOPS—VIEW OF OVERHEAD CONSTRUCTION IN YARD

In comparing these shops with others there are certain conditions imposed upon the designers due to the location which must be kept in mind. It was in the first place economical to use as small a site as possible because the area had to be filled in to a height sufficient to bring the bottoms of the pits well above high water. This filling had not only to be put in but it has to be kept in against the encroachment of the severe storms to which this point of the island is particularly exposed. At the same time these same storms made necessary an unusually large shop area because much maintenance work must be done to offset the excessive wear and tear of equipment. The wind drives the sand everywhere and causes cutting of bearings and commutators, necessitating frequent overhauling. Similarly, the storms produce severe abrasion of the car-body surfaces which have to be refinished frequently. For this reason a very large paint shop was provided, as well as ample carhouse space to enable the cars to be kept under roof when not in use. The combination of these two general conditions accounts for the complete filling of the site.

In the design of the buildings a substantial type of construction was adopted on account of their exposed location. All unnecessary refinements were avoided and as inexpensive a form of construction as was consistent with the other requirements was adopted. Appearance was, however, considered unusually important also because the site is such a conspicuous one. The company desired to do its share in boosting the city as a summer and winter resort not only by means of attractive buildings but by suitable planting of all unoccupied areas. The provision of ample light was also considered of prime importance by the designers, and the general type of construction lent itself readily to the use of numerous skylights and large windows.

An important design feature in the layout was imposed by the fact that, while the number of cars to be handled in the shops is comparatively small, yet for the reasons indicated the area covered by them had to be quite large. On the other hand, the road could not afford to employ as many men as would usually be necessary in shops of the same size. The equipment, therefore, had to be so selected and placed that the repair and maintenance work could be handled rapidly by a small force. Moreover, Atlantic City is comparatively isolated from other large cities, and it was necessary to have the shops as independent of other shops

as possible, therefore they were made quite complete and self-contained.

IN THE OFFICE BUILDING

The office building contains two floors, the lower of which is used for general operating purposes. There are two main entrances, one into the room provided for the trainmen, the other into a general lobby in which the local telephone switchboard is located and from which access is furnished to the master mechanic's office and to the general offices upstairs. The trainmen's room is furnished with tables and chairs, and opening from it is a handsomely equipped lavatory beyond which is a large room containing sanitary metal lockers. The receivers' counter is placed on one side of the trainmen's room, and a door on the same side leads into the dispatcher's office. From the wide front windows of his room this official commands an unobstructed view of all cars rounding the loop or entering the yards.

The master mechanic's office is so placed that it is virtually in the corner of the machine shop, yet it forms a part of the office building. The men entering the machine shop pass an office door near which the time clock is placed.

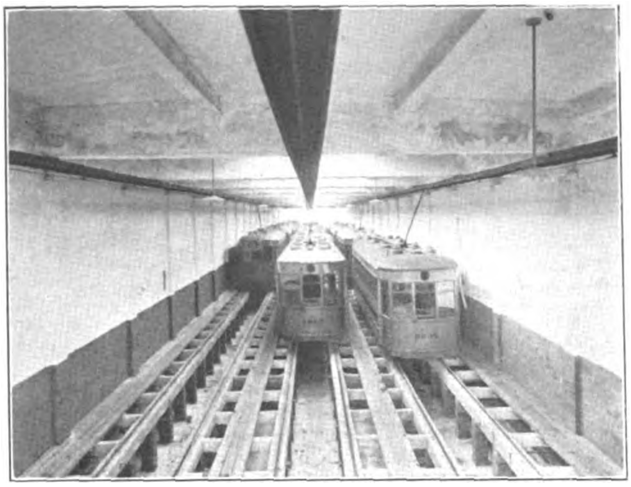
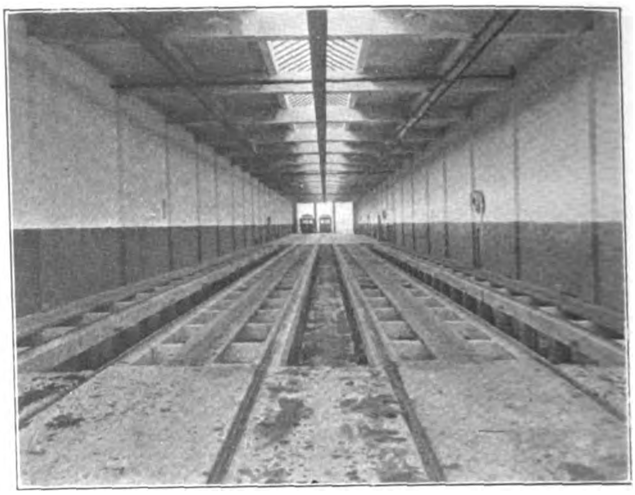
ATLANTIC CITY SHOPS—OVERHEAD CONSTRUCTION SHOWING SPAN AND PULL-OFF WIRES





ATLANTIC CITY SHOPS—TWO VIEWS IN BAY OF CARHOUSE

of the local officials of the company and their staff of clerks.

In the Machine and Wood Shop Building

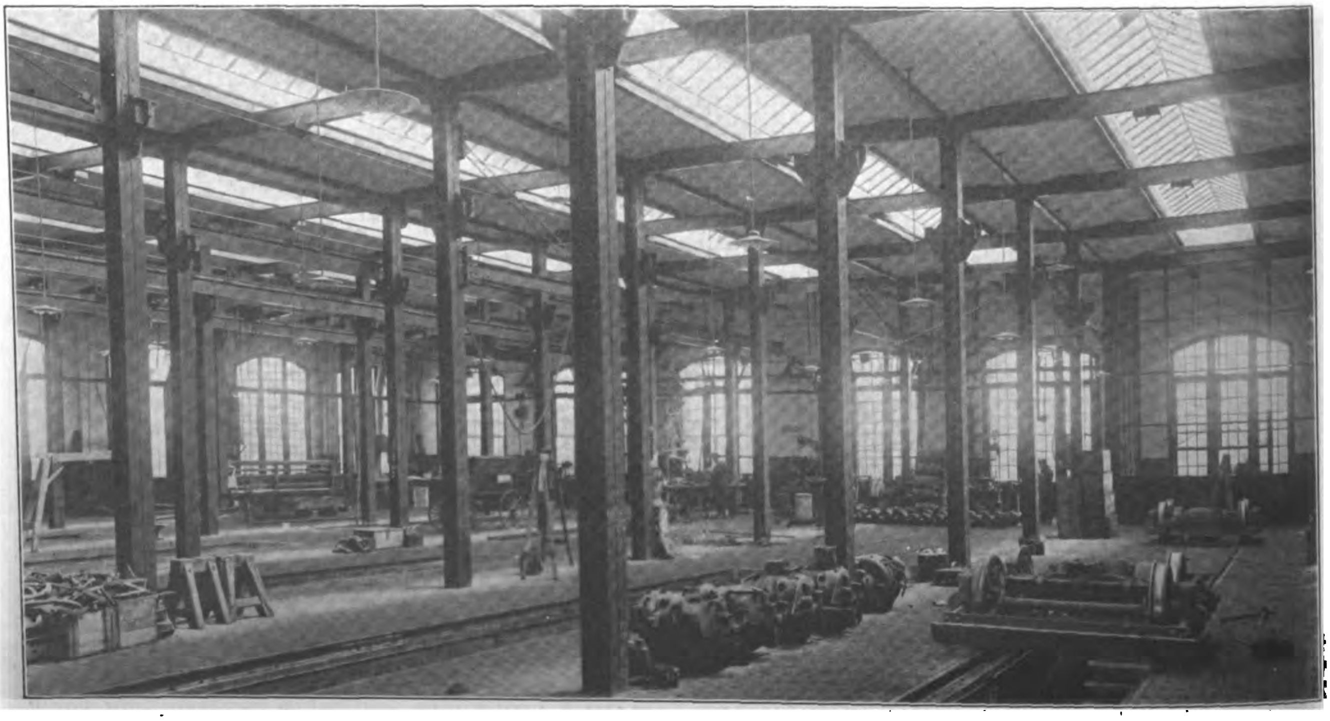
The machine tools in the machine shop are placed around the outside walls, which consist almost entirely of glass. Two of the five tracks are served with 10-ton, single-beam, hand-operated traveling cranes. Each crane is supplied with two trolleys, each carrying a 5-ton chain hoist. Two light air-operated jib cranes with a reach of 11 ft. swing from columns and serve some of the pits and machine tools. All of the five tracks in the machine shop are provided with pits for one-half their length.

In one corner of the shop is a tool room with modern steel racks and bins. This is rather distant from the heaviest machine tools, but it is placed in its present position so that it can open into a large store room partitioned off at one end of the adjoining wood shop.

The wood shop is provided with three short tracks and pits, leaving about three-fifths of the floor clear for benches, tools and temporary storage.

The machine and wood shops are floored with wooden blocks. These are of long leaf yellow pine, averaging 8 in. in length, 3 in. deep and 3 in. wide. They are impregnated with a dead oil of coal-tar to the extent of 12 lb. per cubic foot. The blocks are laid upon a concrete foundation 3 in. thick, over which is laid a 1-in. bed of sand screened of pebbles of more than ¼-in. diameter.

The western side of the building occupied by the machine and wood shops is taken up with locker room for shop men, lavatory, store rooms and boiler room. As the floor of the last-named had to be below high water level special pains were taken to keep the water out. The construction is as follows: After the soil had been excavated to the required depth a 4-in. concrete bed was laid on the bottom and upon this a layer of hot asphalt was spread. On this were laid alternate layers of heavy waterproofing felt and Trinidad asphalt, four of each. The layers of felt were carried under and up along the sides of the walls and attached thereto with asphalt. On the felt was laid immediately a 1-in. layer of cement to protect the waterproofing and above this the finished floor of 12-in. thick concrete, reinforced with steel rods, was placed. The remain-



ATLANTIC CITY SHOPS—VIEW IN MACHINE SHOP der of this part of the building has a concrete floor of the usual type.

IN THE PAINT SHOP AND CARHOUSE

The paint shop is in three bays, each containing three tracks, those in one bay being provided with pits. As in the machine and wood shops there is a skylight over each track, as indicated by the dash lines in the illustration. The floor is of concrete.

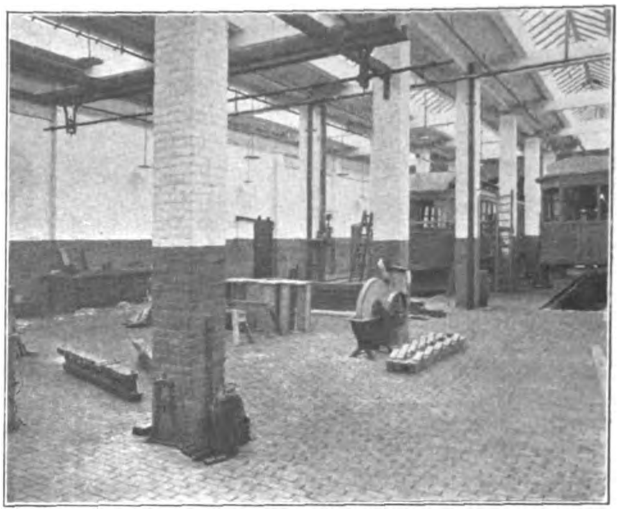
The pit arrangement of the carhouse is shown in section in an accompanying figure and photograph. On a 6-in. reinforced concrete foundation 13-in. x 13-in. brick piers were erected in parallel rows 5 ft. 4 in. center to center longitudinally and dowelled into the floor. On these were laid 7-in., 15-lb. I-beams, spaced about 4 ft., 11 in. apart. On top these beams were laid steel plates 5/16 in. x 4 in. x 10 in. in size, and upon these standard T-rail was laid, clipped at 2-ft. intervals to the I-beams. Concrete beams were then molded about the I-beams and rails, and crossbeams of reinforced concrete were placed in the alleyways outside the pits to support a plank runway. The usual concrete floor was laid in the section without pits.

The pits are lighted by means of incandescent lamps placed under the stringers described above and clusters hung from the roof. The incandescent lamps in the pits are placed about 6 ft. apart and are fed from conduit line imbedded in the concrete stringers.

OTHER FEATURES OF GENERAL INTEREST

With the exception of the machine shop the roofs are supported on brick columns, and partitions are, in general, of hollow tile. The exception of the machine shop columns, which are of steel, is made on account of the cranes. In all but the office building the columns support deep steel I-beams upon which lighter longitudinal I-beam roof purlins are laid. On this is laid a 4-in. reinforced gypsum slab, known as the Metropolitan system, with Barrett specification roof.

The buildings will be heated by steam on the vacuum system from three boilers having a combined heating surface of about 25,200 sq. ft. The vacuum will be maintained and the condensate removed from the return pipe by means of an electrically driven pump.



ATLANTIC CITY SHOPS—VIEW IN WOOD SHOP

Although it was at first intended to use arc lamps for general illumination throughout the various buildings, and drawings were prepared accordingly, it was subsequently determined to use Mazda incandescent lamps exclusively, these being operated in series directly from the railway circuit. Clusters of five lamps are used with 18-in. enameled steel reflectors all rigidly suspended from the roof by means of pipe conduit. The main distributing switchboard of marble is located in the master mechanic's office, and contains the usual switches, fuses, circuit breaker and wattmeter. From this main switchboard feeders are run to centers of distribution in the various buildings and connected to panelboards located in iron boxes from which the individual circuits are run direct to the outlets. All wiring throughout, both lighting and power circuits, is in iron conduit imbedded in the roof and floors.

Fire protection is furnished by an equipment of wall reels and racks, hose, nozzles, etc., and a special system of piping. An automatic sprinkler system is installed in the carpenter shop and store rooms.

The trolley wire in the yard is supported from span wires in the manner shown in an accompanying diagram. Space for poles was at a premium and they were placed to use only space which was not available for car movement.

The design and construction of the new shops were carried out under the direction of Stern & Silverman, Inc., of Philadelphia, consulting engineers for the West Jersey & Seashore Railroad Company. The operation of the Atlantic City & Shore Railroad is in charge of George F. Faber, general superintendent.

Educational Safety Work by the Public Service Railway

This Work Is in Charge of a Specialist Who Devotes His Entire Time to Co-operating with All Educational Agencies in New Jersey as Well as Furnishing Regular Instruction to Company Employees

The Public Service Railway Company carries on systematic educational work in co-operation with all educational agencies. An active interest in the subject has been developed throughout the State of New Jersey.

In the issue of the ELECTRIC RAILWAY JOURNAL for May 30, page 1190, Charles H. Coe described the manner in which the system for educating trainmen has been developed by this company. The systematic training of platform men was begun on December 1, 1907, primarily for the purpose of reducing the number of accidents. Since the training schools were inaugurated the safety movement has spread in all directions, until now the company utilizes every available educational agency in the State to promulgate the idea of "safety first." The fundamental purpose of the present movement here as elsewhere is to impress upon the individual his responsibility for his own safety as well as that of others. In carrying out this idea regular lectures are given to trainmen, talks are made in the schools, films are shown in the moving-picture houses, illustrated lectures are given in department stores, the Boy Scouts and the Camp-Fire Girls are enlisted in the movement, public lectures under various auspices are delivered, co-operation of wagon and automobile owners is secured, moving picture shows are given on public playgrounds, in short, every possible agency is used to reach the people. This educational work is in charge of H. V. Drown, general claim agent, and the detail work is directed by A. J. VanBrunt, who devotes all of his time to it.

LECTURES TO TRAINMEN

The carhouse lectures are delivered at intervals of six months, being given at each carhouse two or three times so that all of the men may have an opportunity to hear them. Attendance at the lectures is voluntary, but the record shows that nearly 87 per cent of the men attend. The lectures last from one to one and a half hours and consist of explanations of the work which the company is doing, statements of progress since the last lecture, exhibitions of lantern slides and moving-picture films and statements of general principles upon which successful accident prevention rest. Every endeavor is made to put these matters into forms which will be interesting to the men and to relate the statements to the work of the Public Service Railway.

As the effect of this work depends largely upon the character of the lectures given it may be of interest to outline a sample lecture briefly. This, like the other lectures, is illustrated by means of the moving-picture machine, by means of which the reels prepared specially for the Public Service Railway are exhibited. Pictures not bearing directly upon the safety work, such as those of field day sports and comedy performance, are used to relieve the more serious part of the lecture.

A sample lecture may be taken for illustration. In this the men were first told briefly some of the interesting things which had occurred since the last lecture. Data as to the welfare of the work were given, showing that the amount of benefits, pensions and insurance paid was much greater than was necessary to comply with the law; that, in fact, the present system was in operation before the law was put into effect. The endeavor was made to inspire a spirit of pride in the organization with which these men are connected, and instances were given to show that the organization is permeated with a spirit of loyalty.

After this preamble the lecturer discussed in detail some of the accidents which had occurred on the Public Service Railway recently. The classification of the accidents was made under these heads: Boarding cars, leaving cars, collisions with cars, collisions with vehicles, collisions with bicycles, collisions with automobiles, derailments, disturbances, injuries on cars, pedestrians struck, clothing damaged, and accidents to employees. The illustrations were taken from accidents which had occurred under the men connected with the carhouse in which he was speaking at the time. In closing attention was called to some of the characteristics of human nature with which the platform man has to struggle and suggestions were made as to the proper way to deal with these.

One of the features of the lectures which proved most interesting to the men was the résumé of the results of efforts of men and departments to reduce the number of accidents. Statistics were given showing gain by cutting down the number of accidents, or loss by increase in the number of accidents, and comparisons were made to explain the conditions existing in the several districts and the effect upon the number of accidents resulting therein. The effort was made to show the men that the safety department is working with them, not for them; in other words, that the movement is a co-operative one.

To facilitate the lecture work an automobile has been provided for the purpose of carrying the lecture equipment. This consists principally of the moving-picture apparatus, including an asbestos booth. A first-class operator goes with the outfit.

WORK IN THE SCHOOLS

As it is generally agreed that education along safety lines must begin with the child, the Public Service Railway makes a systematic effort to get in touch with school children. During the latter part of the month of January, 1912, a special campaign throughout the State was inaugurated. Several assistants were employed for this work, women being assigned to the lower grades. Up to January 1, 1914, practically every parochial and public school on or near trolley lines was visited. In addressing children the speaker hangs up before the audience a large banner with the words "Safety First" lettered in contrasting colors. The lecture is put into attractive story form, sometimes using "the giant" to make it more impressive. The speaker takes some powerful giants, which are normally made to work for us but which, on account of their great strength, may do much harm. These giants may be sources of danger and are, therefore, closely related to the "safety first" movement. The acrostic on the following page has been found very effective.

In many of the schools it has been possible to establish corps of "safety scouts." Two dozen, more or less, of the elder boys are picked out, the selection being made on the basis of their standing with their comrades. These are organized into teams, each under a

Steam is a giant which comes from the water.

Think! Stop!
Don't Hurry!
Look Before You Cross

Teach others to think of

"SAFETY FIRST"

Cars cannot stop as quickly as you can.

Cars must run on a track, must pass each other.

Teach the children to play safely

To think "Safety First"

A child SHOULD play. MUST play. Last year 1276 children were hurt; 130 were crippled; 34 were killed in the streets of New Jersey. Help teach the children to play safely. Help save all the children, strangers' children as well as your own. A crippled child is a sad sight and is at a great disadvantage all its life.

"The right hand is the right hand for the bundle."

When leaving a car hold your bags or bundles in right hand, grasp car rail with left hand, and so face front of car. If your dress gets caught, your foot slips, your ankle turns, or the car starts, you will not fall.

"The right hand is the right hand for the bundle."

Every day many persons are hurt because they face rear of car in getting off and some are crippled for life.

Face front when leaving

PUBLIC SERVICE SAFETY WORK—PAGES FROM DEPARTMENT STORE FOLDER

leader, for the purpose of watching the other children. The teams serve during alternate weeks each with the leader in charge during the entire time that the scouts are on duty, namely in and after school hours as well as during recesses and at other times when the children are apt to be in danger. The leaders report to the school principals as occasion requires.

The children are furnished with safety buttons which they are expected to wear, and in each school a pennant is hung bearing the legend: "New Jersey Safety League." The teachers are very enthusiastic about this work and back it up in every possible way.

A law was passed last year by the Legislature of the State of New Jersey making the teaching of the idea of safety compulsory in the public schools. While this law is just now being put into effect the teachers, with very few exceptions, have been utilizing the safety lectures for educational purposes for some time and have endeavored to maintain interest in the idea. An appropriation has now been made to enable the State commissioner of education, Dr. T. M. Kendall, to carry out the provisions of the law. In all of the school work which has been described the idea of the economy of safety is pointed out to the children. The lectures are followed up by subsequent visits and the instructor has been gratified to note how much of the original instructions remained. A safety text-book has been prepared as well as a number of wall charts for use in connection with the instructions.

OTHER DEVICES FOR GIVING PUBLICITY TO SAFETY

The introduction of the moving-picture outfit has given the opportunity to co-operate with moving-picture houses throughout the State. The operator has been sent to all of the large cities with the accident film and has exhibited it himself. The theater managements are not willing to pay for a film of this kind, but few of them object to having it shown. In some cases the exhibition of the film has been preceded by a lecture which has been repeated several times a day when necessary. At least 225,000 people have been reached in this way. As the film is costly it is not deemed advisable to send it out without the company operator, on the assumption that the ordinary operator would not give it the proper care.

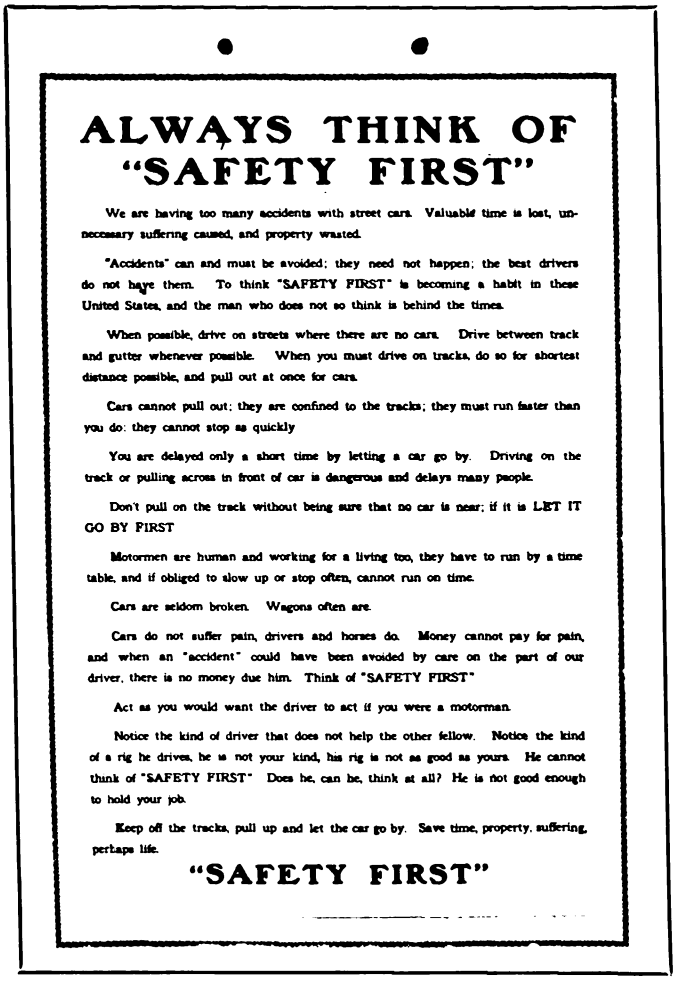
Another avenue to publicity has been through the department stores. Most of the large stores are provided with lecture rooms and they are very glad to have safety lectures delivered, as it is good advertising for the merchants. The lectures are advertised by means of circulars distributed to shoppers, as illustrated herewith.

The company "stereomotograph" is also doing good work in showing slides in the windows of the company's stores in several cities. This machine exhibits a series of lantern slides automatically, and a number of accident slides have been prepared for use in it. These are shown interspersed with catch phrases, such as the following: "Don't Play Ball, Tag, Catch, or Any Game in the Street Where Cars, Automobiles and Wagons Must Run," "Don't Steal a Ride on a Car, a Wagon or an Automobile," "Do Wait Until a Car Comes to a Stop Before Getting Off, and When You Do Get Off Face Toward the Front of the Car," "The Right Hand is the Right Hand for the Bundles," "Don't Walk on a Railroad or Trolley Track," "Work, Play, Travel, but Always Think 'Safety First'," etc. The machine is kept in one store from one to three weeks, that is, until the public interest has begun to decline.

The organization of the Boy Scouts and the Camp-Fire Girls and the popularity of these movements has furnished an excellent means of reaching an influential class of boys and girls. Illustrated lectures are given under the auspices of these organizations, and the Y. M. C. A. has also co-operated. The churches have also freely offered the opportunity for meeting other boys and young men not actively connected with the Scout movement, as many churches have organizations along somewhat similar lines. Co-operation in this phase of the work has been most noticeable throughout the southern part of the State where there are few cities.

Still another effective method for reaching the general public has been through lectures delivered in lodge rooms, high schools and churches. By means of active advertising in the local papers it has always been possible to secure a good attendance at these lectures. The line of argument brought out in them has been that mental poise is essential to success and that the successful men and women are those who do not hurry. It is the hurried person who is hurt.

As a great many accidents occur through carelessness of wagon or automobile drivers, the safety department has endeavored to co-operate with owners by means of posters which are furnished for use in barns and garages, and occasionally lectures are given to groups of drivers. The meetings of drivers' unions have afforded an opportunity in this direction. Up to the present time nearly 250 owners employing 6000 drivers and chauffeurs have hung the company's posters, signed either with their individual or firm names.



ALWAYS THINK OF "SAFETY FIRST"

We are having too many accidents with street cars. Valuable time is lost, unnecessary suffering caused, and property wasted.

"Accidents" can and must be avoided; they need not happen; the best drivers do not have them. To think "SAFETY FIRST" is becoming a habit in these United States, and the man who does not so think is behind the times.

When possible, drive on streets where there are no cars. Drive between track and gutter whenever possible. When you must drive on tracks, do so for shortest distance possible, and pull out at once for cars.

Cars cannot pull out; they are confined to the tracks; they must run faster than you do; they cannot stop as quickly

You are delayed only a short time by letting a car go by. Driving on the track or pulling across in front of car is dangerous and delays many people.

Don't pull on the track without being sure that no car is near; if it is LET IT GO BY FIRST

Motormen are human and working for a living too, they have to run by a time table, and if obliged to slow up or stop often, cannot run on time.

Cars are seldom broken. Wagons often are.

Cars do not suffer pain, drivers and horses do. Money cannot pay for pain, and when an "accident" could have been avoided by care on the part of our driver, there is no money due him. Think of "SAFETY FIRST"

Act as you would want the driver to act if you were a motorman.

Notice the kind of driver that does not help the other fellow. Notice the kind of a rig he drives, he is not your kind, his rig is not as good as yours. He cannot think of "SAFETY FIRST" Does he, can he, think at all? He is not good enough to hold your job.

Keep off the tracks, pull up and let the car go by. Save time, property, suffering, perhaps life.

"SAFETY FIRST"

PUBLIC SERVICE SAFETY WORK—POSTER FOR USE IN GARAGES AND STABLES

Another and the last phase of the work which will be mentioned is the co-operation with the playground commissioners. These officials are very willing to give opportunity for moving-picture shows in the public playgrounds at night. In this way the largest audiences of all are reached, in some cases amounting to several thousand.

THE SAFETY COMMITTEE

A new and promising feature of the safety plans is the safety committee organized on Feb. 20. It is subsidiary to the works committee and its members are the assistant general manager, the general superintendent, the mechanical engineer, the engineer of maintenance of way, and the general claim agent (chairman). The assistant to the general claim agent acts as secretary. Regular meetings are held monthly and special meetings are called when occasion demands. Suggestions for safety plans are requested from employees and are given serious consideration. A great many are received, in one case eighty being considered at one meeting. If suggestions are approved they are referred to the works committee, with recommendations for their adoption. In each instance the maker of a suggestion is notified of its receipt, with the statement that it will be carefully considered. In addition to the handling of suggestions the committee passes on general matters relating to safety. The bringing together of a committee of this sort makes practical the accomplishment of improvements that could not be made without its aid.

CONCLUSIONS

From the above description it is evident that the work of the safety department of a railway company can have branches of its work reaching out in all directions. In all of this work, as has been illustrated, the Public Service Railway endeavors to instil fundamental principles. Safety of life and limb comes first. If, in spite of all this work, accidents do happen the claims department considers the moral aspect of the accident first in endeavoring to adjust the claims. Contrary to the general impression the company finds that claim adjusters do not become hardened by their work. The endeavor is made also to impress the fact that the destruction of property as well as life is criminal. The studies which the company has made indicate that in the United States less progress has been made in the conservation of human life than abroad. Our government has done much in the conservation of natural resources of a material nature, but not much in the conservation of human life. In Europe there are at least twenty-eight safety museums under the direction of the governments. To be sure, our government is giving some attention to the safety of workmen in mills and factories, but pedestrians and travelers generally are in as great danger as our workmen. The importance of recognizing this fact has been demonstrated in New Jersey as well as elsewhere. While it is difficult to evaluate safety work in terms of statistics there is no doubt that it well repays any reasonable expenditure made upon it.

Reducing the Operating Ratio

BY S. H. BENNETT, AUDITOR HAGERSTOWN & FREDERICK RAILWAY COMPANY

The Hagerstown & Frederick Railway Company of Maryland has under way an active campaign to bring down the operating ratio from 64 per cent, which it was last year, to 50 per cent, which is considered a proper goal for effort. To stimulate interest in this campaign the accompanying diagram has been prepared and is posted in blue-print form in conspicuous places. The chart was prepared primarily to excite interest in obtaining "results" for the company. No one can read the various articles in the ELECTRIC RAILWAY JOURNAL, both editorial and contributed, without being interested, and no man filling a position of responsibility with his company can stop at simply being interested. The step from interest to enthusiasm is an inevitable one. To carry enthusiasm to other people, however, is not easy. The problem is to get the rank and file of the men in an organization to not only read articles bearing on lines of work, but to absorb them. Unless it is possible to inspire an ardent wish for the opportunity to assist in carrying out formulated plans, the preparation of these plans is largely in vain.

As will be seen from the diagram, the central feature is a pointer attached to the center of a beam at the point indicated by the star. On opposite ends of the beam are hung weights representing counterbalancing influences, some of which tend to increase revenue and others of which tend to decrease expense. The former is indicated by a positive sign and the latter by a negative sign. Obviously the purpose of the organization is both to increase revenue and to decrease expense and thus to swing the pointer toward the left. The signals at the top of the chart are intended to indicate danger on the expense side and safety on the revenue side.

Beginning at the top of the chart it will be noted that the efforts of the stockholders are indicated by a small rectangle. While it is true that, to accomplish results, everyone should contribute to this end, yet in the electric railway business the owners—that is, the stockholders—have no part in conducting the business. No one seems to expect them to do anything, and as a rule they live strictly up to this idea. The directors occupy a different position and are represented here by the rectangle labeled "company policy." While they do not engage in active work they consciously or unconsciously formulate the policy of the company and in this way exert a powerful influence upon the public. This influence the officials constantly feel, sometimes helpfully, sometimes otherwise. We cannot in any manner govern the actions of our directors. We simply know them as a power which exists. As neither the stockholders nor the directors influence the operating ratio they are represented as outside of the beam and pendulum system.

HAGERSTOWN & FREDERICK RAILWAY—"RESULTS" CHART

As stated above, the position of the beam is influenced in the direction to indicate improvement by increase in weight on the revenue side or decrease in weight on the expense side. In practice too often the latter method is used to improve conditions, as it is the easier one. In doing this, however, great care should be exercised so that the property may not be sacrificed in order to make a good showing. The best effect is produced by securing a combination of as great an increase in revenue as possible with such a decrease in expense as will not interfere with the proper upkeep of the property nor imperil its safe operation.

At the bottom of the chart is shown the master key to efficiency. The ideal key, as shown, is one in which personal interest forms the handle and financial interest the blade. If the employees own some of the company's securities the greatest possible interest is assured, for "where a man's treasure is, there will his heart be also."

This chart is put out in blue-print form because there is something compelling about a blue-print. Men will pass pamphlets, books or even libraries, with hardly a glance, but a blue-print they will not pass. It demands attention as something out of the ordinary; it catches the eye and carries an impression to the mind more lasting than that conveyed in any other manner. Plans are usually shown in blue-prints, hence a blue-print suggests a plan. Any concrete plan of a particular business is interesting, if only that it may be criticised and condemned. We had this idea in mind when the present chart was produced, and determined to make it the first step in a campaign in which there would be no stopping places.

I have stated that the securing of results depends upon the excitation of interest. This in turn depends upon stimulating the faculty of observation. I am convinced that men do not see as they should and have proved this to my satisfaction by a very simple test. I placed in different parts of a building, in halls, waiting-room, freight yard, etc., the following articles: Two gem lamps worth say 25 cents each, one copper bond worth 40 cents, one block of switch rubber worth 60 cents and a package of stationery worth $1.50. These were placed carelessly but conspicuously and a dozen employees of the company were taken over routes embracing visits to every one of the articles. Incidentally they were taken past a hydrant running at full blast (we buy water on a meter basis) and six 40-watt tungsten lamps burning brightly in broad daylight. As far as possible the routes were all different but at the end of each a coin was conspicuously placed. The result of the test was that not one of the men saw anything in the material line, but every one saw the coin and pocketed it. One cannot think that if these articles had been lying around in the men's homes they would have been passed by. In this case each article would have commanded instant, personal interest as something purchased and labored for and therefore something which the owner could not allow to go to waste. The articles which were owned by the company were not observed simply because the men had not been trained to see them and because they lacked the element of personal interest. The test seems to me to prove conclusively that, not only do men not see, but they are living under two separate standards. One standard applies to their own affairs, the other to the affairs of the company from which they derive their livelihood. The employers should do all in their power to correct this condition, as no man is a really valuable employee until he learns that there is but one standard of interest in personal and company affairs. Our company is hopeful of results from a consistent effort to enlist single-standard interest. We believe that real progress is being made in the reduction of the operating ratio.

Block Signals on the Kansas City, Clay County & St. Joseph Railway

This 1200-Volt, High-Speed, Interurban Railway Has Recently Placed in Service a Complete System of Automatic Block Signals Which Is Described in Detail by the Author, Who Includes Figures Covering the Total Cost of the Installation

BY ROBERT P. WOODS, CITY MEMBER BOARD OF CONTROL, KANSAS CITY RAILWAYS COMPANY

An automatic block signal system recently completed on the Kansas City, Clay County & St. Joseph Railway, under the direction of the writer, embodies some features of interest in signaling on electric railways. This road is a 1200-volt d.c. line, doing an exclusive interurban business and operating frequent trains at high speed. After about two years of consideration as to the system and the type of signals best adapted to the conditions, J. R. Harrigan, general manager of the company, directed that contracts be entered into for the installation of an absolute automatic block signal system with continuous, alternating-current, track circuits. It was decided also that current should be provided for station and switch lights along the whole route. The Union Switch & Signal Company's apparatus was used.

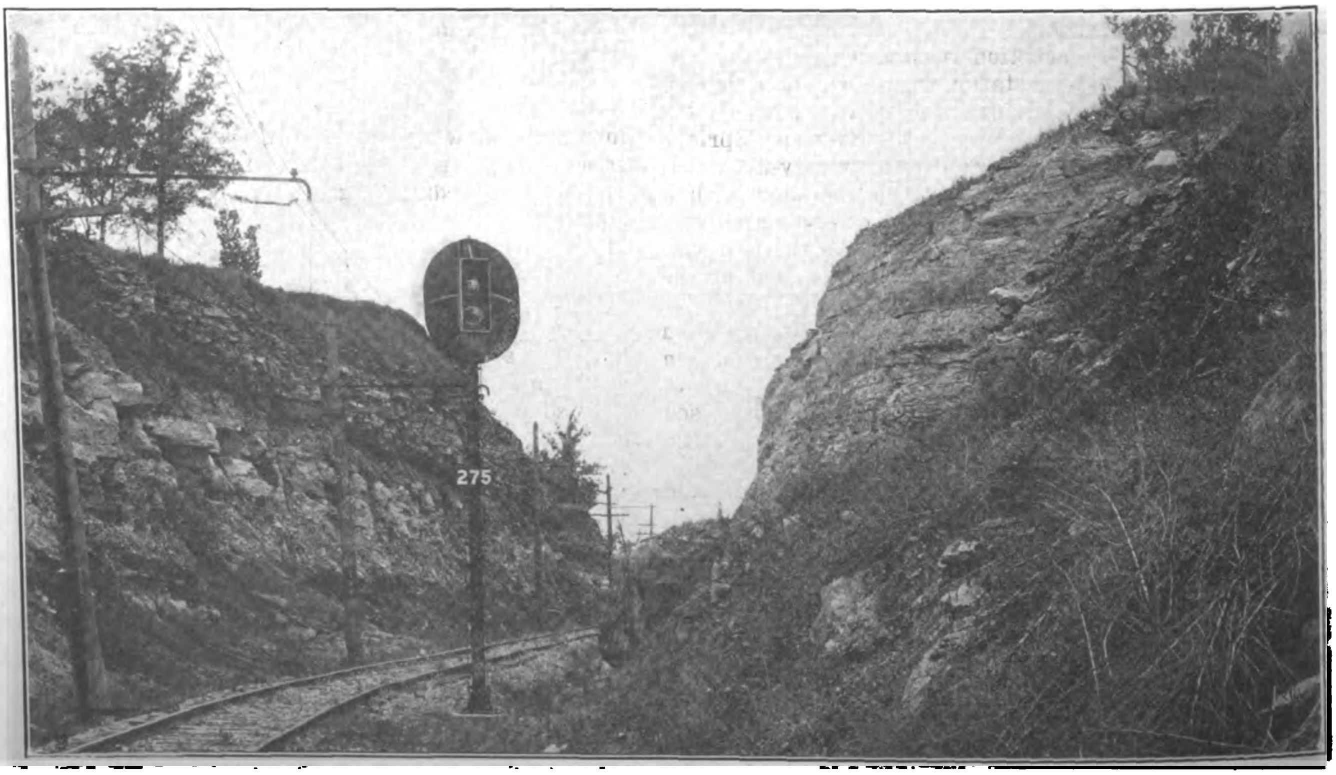
The road consists of two single-track divisions, both extending from Kansas City, Mo., one northeast 28.35 miles to Excelsior Springs and the other northwest to St. Joseph, a distance of 52.44 miles. The length of track outside of terminals on the Excelsior Springs division is 24.5 miles, all of which has been included in the signal system. This division has been divided into nine blocks varying in length from 6950 ft. to 18,704 ft. The predominant length of block is about 15,000 ft. The length of track under the signal system on the St. Joseph division is 46.6 miles, which also includes all track outside of terminals. This division has been divided into sixteen blocks varying in length from 6154 ft. to 23,201 ft., with about 15,000 ft. as the predominant length of block.

Each block in the signal system, which is of the Union Switch & Signal Company's "T-D-B" type, is a unit in itself, and cars occupying one block have no control over signals in an adjoining block, following movements being provided for by having intermediate signals located about 1000 ft. either side of the center of the block, thus providing for the operation in the same direction of two trains in the same block and both being protected by absolute signals.

At each siding there are placed two semaphore signals, one for each direction of traffic. These semaphores are electrically operated and for night indications are lighted with two 2-cp lamps. The semaphores are of the Style B one-arm, two-position type, operating from 0 deg. to 60 deg. in the upper left-hand quadrant, indicating "Stop" at 0 deg. or horizontal and "Proceed" at 60 deg.

About 1000 ft. on either side of the center of block, depending upon the block length, is located an intermediate light signal of the Model 13 type, provided with one red and one green lens, each about 8 in. in diameter, and hooded for daylight indications. Two 25-watt lamps are used for each of these indications.

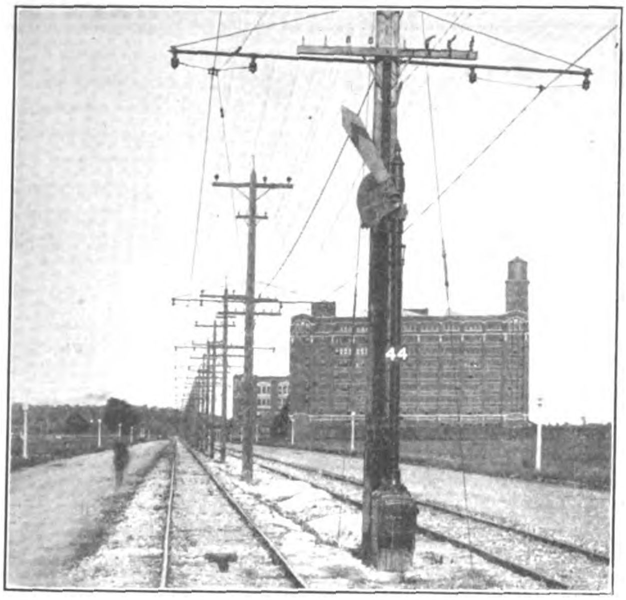
At two sidings which are used for light freight operations only, there have been installed switch indicators. These indicators are small unlighted semaphores, each mounted in an iron case on a 4-ft. stand, and they always indicate "Stop" to trains occupying the siding. Before a car leaves one of the sidings the trainman must open the case and throw the indicator into circuit; if the block is not occupied the small semaphore will go to "Proceed" and must be held in this position



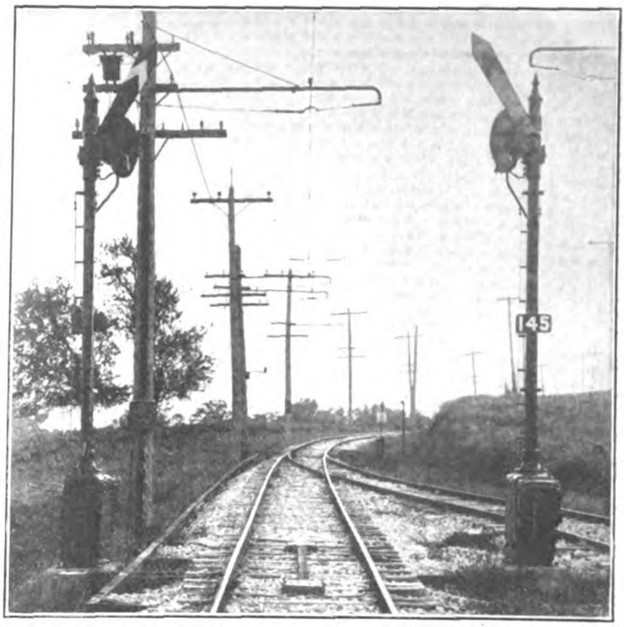
K. C., C. C. & ST. J. SIGNALS—INTERMEDIATE LIGHT SIGNAL AT CURVE IN ROCK CUT until the car passes out on the main line, thus setting the home signals at "Stop" and giving the car that leaves the siding the right-of-way in the block. The switch indicators do not indicate any movements into the siding from the main line.

The overhead wiring for this system consists of two No. 6, 40 per cent, copper-clad wires for the transmission system, which is 2200-volt, single-phase, twenty-five-cycle; and three No. 10, copper-clad, 30 per cent wires for the 110-volt control wires. There are two additional wires of the same voltage from the center of the block to each of the intermediate light signals. Where station lights are provided an additional wire from the nearest line transformer is necessary.

Insulated rail joints of the Keystone type are placed in the track at the end of each block, confining the signal track circuits, and impedance bonds of 500-amp capacity are placed in the track to take care of the return propulsion current. All of the old cross-bonds in the track were removed.



K. C., C. C. & ST. J. SIGNALS—HOME SIGNAL REAR END OF LONG SIDING IN CITY STREET



K. C., C. C. & ST. J. SIGNALS—VIEW OF HOME SIGNALS AT SIDINGS, SHOWING FRONT AND REAR ASPECTS

Power for signal operation is obtained from the 730-volt side of the main substation transformers, a double-throw switch being provided for taking power from either bank. At the substation on the Excelsior Springs division, two 15-kva, 730—2200-volt, twenty-five-cycle, single-phase transformers have been installed with a single panel switchboard for controlling the signal current. Similar installations were placed in the two substations on the St. Joseph division, except that at the second station two 10-kva transformers were used instead of the larger size. Line transformers are installed along the line to step the 2200-volt signal transmission current down to 110 volts for signal controls and to 12 volts for track circuits. Vane type relays are used for the line and galvanometer type for the track circuits.

All shelter stations and switch stands are electrically lighted, the shelter lights being taken from the 110-volt taps on the line transformers and the switch lights from the 12-volt taps of these transformers. The switch lanterns are provided with two 2-cp Mazda lamps. The shelter stations each have one 40-watt Mazda lamp. Individual 2200—110-volt transformers are used at the three depots for lighting these stations.

Trains are operated on orders from the dispatcher and the signals are additional safeguards against misinterpretation or mistaken orders. A red signal light indicates "stop" and a green light "proceed." In case of a signal giving an indication contrary to the train order, the dispatcher is called and the order verified, because a block signal at "stop" may indicate: (a) a train is in the block; (b) an open switch in the main tracks; (c) a car outside of the clearance point on siding; (d) a broken rail; (e) failure of the system; (f) a broken bond.

The operation of a typical block may be better understood by referring to the diagram on the next page, which shows the block between Avondale and Maple Park on the Excelsior Springs division. This particular block is 18,704 ft. long and the distance between intermediates is 2604 ft. With no trains occupying the block the signals assume proceed indications. Assuming an east-bound car entering the block at Avondale, east-bound home signal 54 and opposing west-bound home signal 91 and west-bound intermediate signal 75 go to the stop indications. The east-bound intermediate signal 70 will indicate stop when the car is within about 400 ft. of the center of the block, and when the car passes a point about 400 ft. beyond the center of the block east-bound home signal 54 will clear, thereby allowing a following movement from Avondale and at the same time protecting the first car from the rear. East-bound intermediate signal 70 and west-bound home signal 91 will not clear up until the car has passed out of the block or entered the siding at Maple Park, and obtained clearance with the main line. The intermediate signals lend an additional safeguard, as in the case of two trains entering the block, one at Avondale and the other at Maple Park, at one time, both intermediates would indicate "stop" and the trains would be held.

Located at each switch is a switchbox which is connected to the closed point of the switch, and when the switch is opened the signals in the adjoining blocks show stop indications. The box may be so set that any desired opening of the track switch will operate the signals. An illustration shows the circuit plan for a typical block.

In Table I is a detailed estimate of the construction of the entire signal system and, as the work is now practically completed, represents the cost of the work. The Union Switch & Signal Company furnished and installed all semaphore and light signals, line transformers, relays, impedance bonds, trunking and all necessary connections. built by the signal company with materials furnished and delivered by the railway company. The railway company furnished transportation for the distribution of all materials and apparatus and did all else including the supplying of poles, wires and line fixtures. All the line-construction labor and the furnishing and erection of all substation transformers, switchboards, and lighting fixtures were also furnished by the railway company. The contract for the equipment was entered into on Feb. 14, 1914, and the signals were placed in operation on the Excelsior Springs division on July 11, 1914, and on the St. Joseph division during the latter part of September, 1914.

The estimated power consumption taken at the switchboard in each substation on the 2200-volt side, is as follows: The Excelsior Springs division, which comprises nine complete blocks, or 24.5 miles of protected track, has nine electrically lighted switchstands and forty-six 40-watt station lights. It will consume under normal conditions 8.1 kw. When all signals are clearing, that is all motors are operating, the maximum demand is estimated at 12.2 kw.

At the first substation on the St. Joseph division, which controls nine complete blocks, or 23.4 miles of track, there are eight electrically lighted switchstands and seventeen 40-watt station lights, and the consumption is estimated at 7 kw. with an estimated maximum demand of 11 kw. At the second substation on the St. Joseph division, which controls seven complete blocks, covering 23.2 miles, there are seven electrically lighted switchstands and twenty-six 40-watt station lights, the estimated power consumed is 6.1 kw normally, or an estimated maximum of 9.7 kw with all signals clearing.

A summary covering the installation of signals and shelter station lighting is as follows:

Total miles of track protected	71.1
Number of blocks operated	25
Number of semaphore signals	50
Number of intermediate light signals	50
Number of switchstands lighted	24
Number of shelter stations lighted (one light each)	51
Estimated cost of lighting	$3,900
Total cost of signal system, including switch lighting, but exclusive of station lighting	$106,490
Cost per mile of track protected	$1,500
Cost per block complete	$4,250

TABLE I—DETAILED COST OF SIGNAL INSTALLATION ON KANSAS CITY, CLAY COUNTY & ST. JOSEPH RAILWAY

Material and labor by the Union Switch & Signal Company	$73,000
Material and labor by Kansas City, Clay County & St. Joseph Railway:	
132 cu. yd. crushed stone (delivered), at $2.50	330
66 cu. yd. sand (delivered), at $2.00	132
198 bbl. cement, at $2.00	396
130 miles No. 6 H. D. C. C. 40 per cent bare wire, 50,700 lb., at 16 cents	8,112
262 miles No. 10 H. D. C. C. 30 per cent bare wire, 40,348 lb., at 15 cents	6,052
18 miles No. 10 H. D. C. C. 40 per cent bare wire, 2772 lb. at 16 cents	443
146 70-lb. Keystone insulated rail joints, at $6.00	876
10 75-lb. Keystone insulated rail joints, at $6.40	64
4 transformers for substations, 15 kva, at $200	800
2 transformers for substations, 10 kva, at $150	300
3 single-panel switchboards for controlling signal circuits, at $125	375
325 lb. 24-in. tie wire, at 16½ cents per pound	53
400 lb. 14-in. tie wire, at 16½ cents per pound	66
6300 porcelain insulators (2300-volt line), at 7 cents	441
11,100 porcelain insulators (110-volt line), at 4 cents	444
600 "J" pins at 25 cents	150
Changing feeder cross-arms to obtain clearance for 2200-volt a.c. signal wires:	
2840 three-pin, 3½-in. x 4½-in. x 5-ft. fir arms (replacing present 4-ft. arms), at 34 cents	965
8520 1½-in. x 9-in. locust pins, at 2 cents	170
5680 ¼-in. x 1¼-in. x 18-in. gaivanized iron braces, at $50 per thousand	284
Miscellaneous bolts and lags	100
Labor substituting new arms, 71 miles, at $10	710
Labor stringing 410 miles wire at $10	4,100
Labor installing switchboards and transformers at substations	225
Changing poles and guys for clearance	350
Telephone interference	750
Transportation of men and materials	950
Bonding and installing insulated joints	600
Increasing track centers at sidings	750
Engineering and contingencies	4,500
Total	$106,490

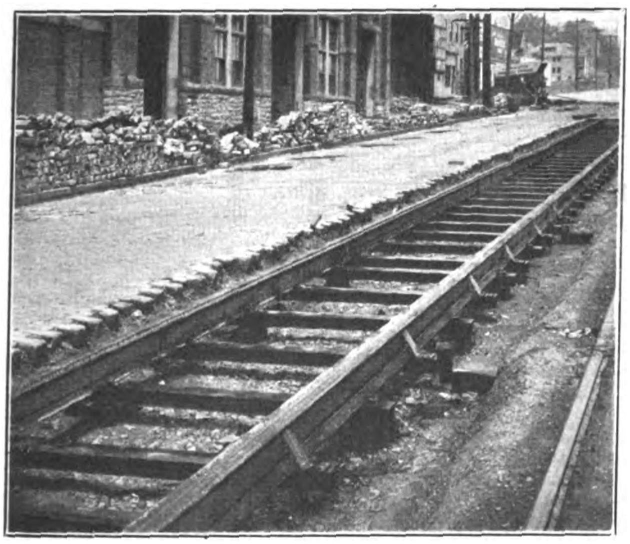
K. C., C. C. & ST. J. SIGNAL—TYPICAL CIRCUIT PLAN

Electric Welding in Track Repairs

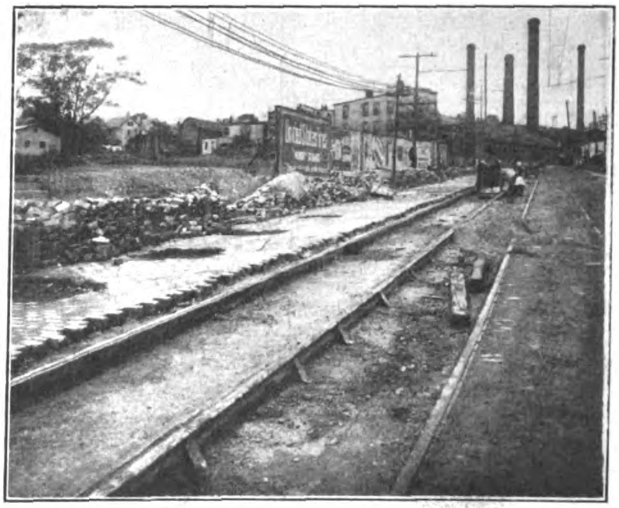
The Author Outlines His Experience with Electrically Welded Frogs and Rail Joints, Giving Details of the Time Required and Current Consumed in Completing Different Pieces of Work with a Portable Electric Welding Outfit

BY F. J. VENNING, SUPERINTENDENT OF CONSTRUCTION CINCINNATI TRACTION COMPANY

In July, 1913, the track and roadway department of the Cincinnati Traction Company received its first portable welder from the Indianapolis Switch & Frog Company. A demonstrator was sent to Cincinnati to instruct our man in operating the outfit. We immediately began the building up of manganese centers in frogs, switches and mates with very good success at first, although our men, as their experience increased, became more proficient in the use of the welder and greatly improved the quality of their work. In a very short time we could see the value of the apparatus and secured a second welder in October, 1913. At this time we set about with the new machine to fill up some open joints in a 2-mile piece of double track laid with relay rails in 1910. Every open joint was closed, thus making a continuous rail for the entire distance. In all the joints thus filled, we have had but one failure and that was due to improper plugging before the joint was welded or filled. After this work was done the welders were kept at work continuously and with increased success on worn-out special work and manganese centers in frogs and crossings.



ELECTRIC WELDING IN CINCINNATI—ELECTRICALLY-WELDED RAIL BRACES AND TIE PLATES ON OAK TIES



ELECTRIC WELDING IN CINCINNATI—ELECTRICALLY-WELDED TRACK READY FOR CONCRETING

During the winter I became personally interested in the welder and followed the work carefully. One of our first important jobs included the building up of twenty broken expansion joints on a viaduct. These were originally made by cutting the rail-ends vertically for about 10-in., and lapping the ends. They were badly battered in some cases and one-half of the head was broken off in others. The repair work included building up all joints to their normal section and replacing the missing sections. This work is to-day in as good condition as it was when completed.

On another job we built up and reclaimed two double-track, double crossovers that were in such a dilapidated condition that renewals would have been necessary if the repairs had been unsuccessful. In some instances as much as 10 in. of the head of the rail at the joint was entirely gone. The method used in this instance was to weld two strips of iron on top of the joint plate and then to build a new head on the rail.

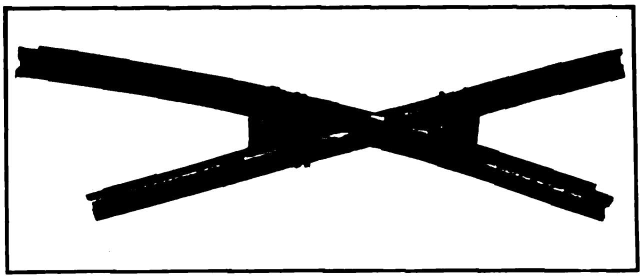
Little or no difficulty has been experienced in obtaining successful results where the welding was done on ordinary open hearth or Bessemer steel rails, but on the manganese inserts and in solid manganese layouts the process is somewhat different. After careful study and a number of tests, it has been found that the maximum success is obtained in repairing work of this type when the amount of metal added at one time is small and the whole quenched at frequent intervals. This keeps the temperature of the manganese insert or manganese casting below the critical point, thus insuring that no change takes place in wearing qualities after the new material has been added.

ELECTRICALLY-WELDED FROGS

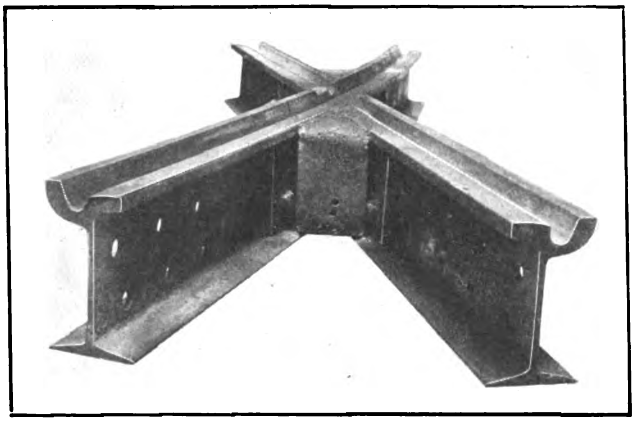
As a rule the Cincinnati Traction Company renews defective insert special work or solid manganese pieces in a large layout with built-up work made of open-hearth standard rail sections. These pieces generally last about as long as the rest of the layout, making it possible to renew the whole at one time. Prior to December, 1913, we had all frogs made at a local shop, the company furnishing the rail and templets from which any piece was to be made. During December, 1913, we concluded that we could make this class of frog cheaper and in much less time, and at the same time could manufacture a better article by using the electric welder, and we found that shop-made frogs which formerly cost us from $45 to $65 could be manufactured for from $16 to $23. Moreover, the shop-made frogs were merely bolted together, whereas our frogs were bolted and welded, making a frog that could not possibly be shaken nor hammered apart, all parts acting as a unit.

Wherever these frogs have to perform heavy duty we burn away the intersecting parts of the head of the rail with the carbon electrodes and build up the parts so removed with hard steel. By this method we supply a harder metal at the excessive wear points and the result has been very satisfactory. Between December, 1913, and May 1, 1914, we built and installed twenty-four electrically-welded frogs, and none have given any evidence of failure in any of the welds. However, if any of these electrically-welded frogs should develop defects, or should begin to show indications of wear or cupping at the intersecting flangeways, we expect to restore the points by welding on hard steel.

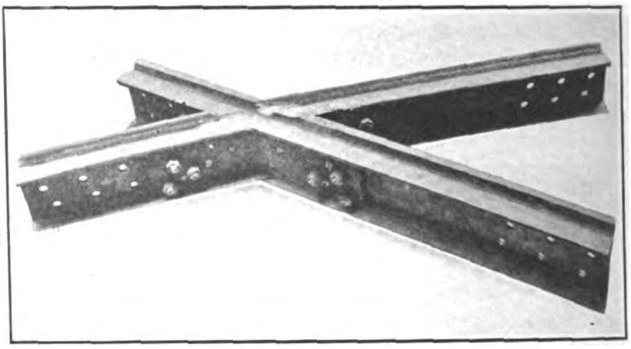
It might be stated that the frogs shown in the illustrations were made practically by two men who did the sawing and fitting, and by a blacksmith bending the plates. All the sawing was done by hand, the only machine work required being that of drilling the few bolt holes. Since this was experimental work no special time was set for the welding, but it was done on rainy days and during extremely cold weather when it was impossible to work men outside.



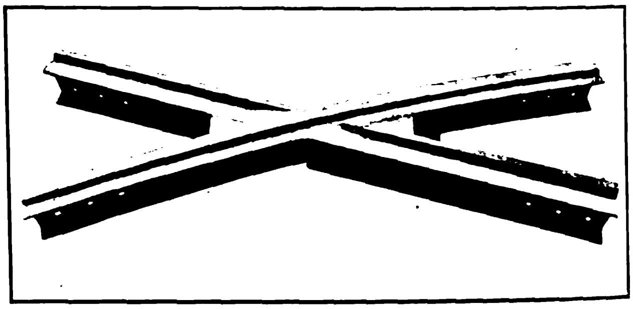
ELECTRIC WELDING IN CINCINNATI—JUMP CROSSING WITH THROUGH RAIL ON CURVE



ELECTRIC WELDING IN CINCINNATI—VIEW OF FROG SHOWING PAVING CHUCK



ELECTRIC WELDING IN CINCINNATI—VIEW OF THROUGH FROG



ELECTRIC WELDING IN CINCINNATI—JUMP CROSSING WITH BUILT-UP FLANGEWAYS

In order to determine accurately the exact cost of frogs built in this manner the Cincinnati Traction Company arranged for an energy-consumption test to be made by the electrical engineering department of the University of Cincinnati. The instruments used were a Westinghouse graphic-recording ammeter, a portable Weston ammeter and a wattmeter. In the test for welding together a frog there was 308 lineal inches of welding. The average current required was 170 amp and the total energy consumption to complete the entire welding process was 161.7 kw-hr. The time consumed in welding the frog was three hours and four minutes, and all of the welding was done with the panels of the welder in parallel. In an experimental run made for a few minutes with only one panel in the circuit, the current consumption was 90 amp. With this, however, the arc was not of sufficient density for heavy welding, but could be used for light welding on thin metal. Other overhead charges added to the total cost of making one of these frogs include that of preparing the drawings and making the templet.

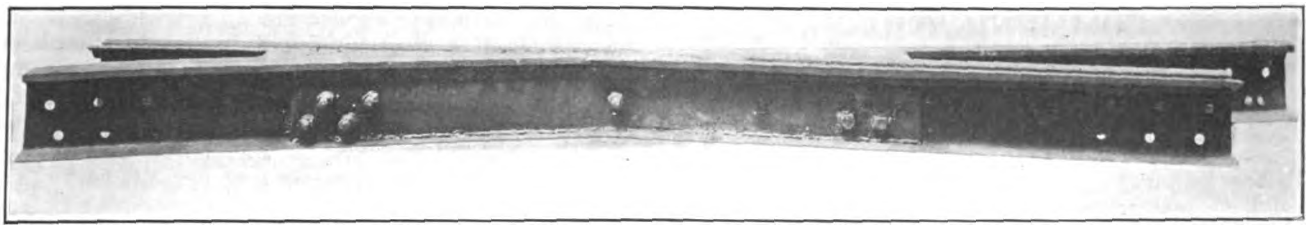
ELECTRICALLY-WELDED JOINTS

The standard rail-joint used by the Cincinnati Traction Company for some time past was of the cast-weld type, and prior to the adoption of the 140-lb. girder-grooved rail section as our standard, we had extremely good results with the cast-welded joint. Out of 10,000 joints installed between 1907 and July, 1913, our percentage of failures was 1.76. However, since the adoption of the 140-lb. rail section, failures of cast welds have greatly increased, and in view of this fact we are of the opinion that the limit of the cast-welded joint is exceeded when it is used on this rail section.

In cases where a cast-welded joint fails we knock off the cast weld and apply a standard channel plate by electrically welding it. This plate is welded to the rail after it has been drawn securely into position by inserting two of the four bolts. If an open joint has developed, due to expansion and contraction, we electrically weld the opening, filling in with hard steel, thus making the rail continuous. Since the electrically-welded plates have been introduced on this property the rail has been made in continuous lengths up to 1000 ft., one piece approximating 1 mile in length.

By the application of the electrically-welded channel-bar and the closed joints, we have not only eliminated joints but also copper bonds. Should a rail break due to contraction after it has been welded in this manner the same method would be used in making the joint at the broken point. It makes little difference whether the opening is 1 in. or 6 in. at the point of the break, because a piece may be inserted and the three sections solidly welded to the plate, thus making the rail continuous, as before.

At the time when the energy consumption was de-

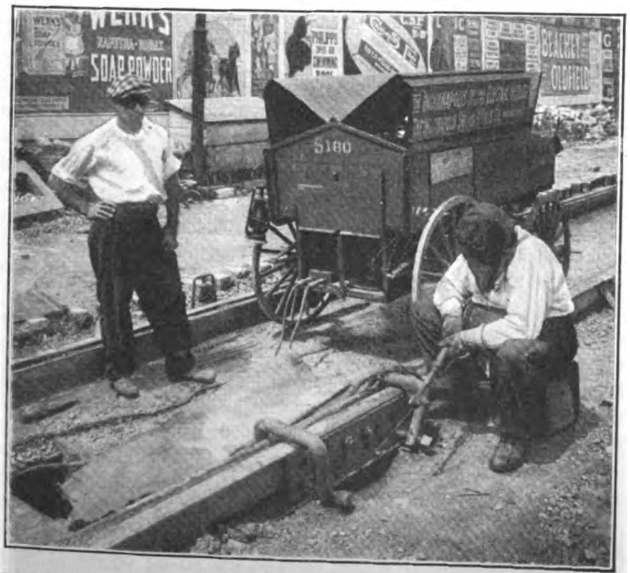


ELECTRIC WELDING IN CINCINNATI—FROG OF 9-IN. TRILBY RAIL—NOTE WELDED PLATE

termined for the electrically-welded frog, a similar test was run on the electrically-welded joint. This joint is made up of standard plates, 32 in. long, designed for the Lorain steel section 140-402. In addition to these plates one-half of a plate taken from a 109-lb. rail section is welded to the base of the rail. In order that the results of this test might be comparable with working conditions on the street, the test weld was made in a section of skeleton track. During the period of the test the ammeters registered at beginning, with resistance of welder cold, 190 to 195 amp. This continued for about ten minutes until the resistance heated, at which time the current settled to a point between 165 and 170 amp, the average consumption for the entire joint being 169.3 amp, with readings taken every minute. The time consumed in welding the joint complete was one hour and ten minutes, thus making the actual energy consumption 79.2 kw-hr. per joint.

WELDED TRACK CONSTRUCTION

Recently we have developed what we consider an ideal track construction in which electric welding largely enters. This may be constructed with either wood or steel ties, but where wood ties are employed tie plates ⅜ in. x 6 in. x 12 in. in size are used on every fourth tie. These tie plates take the form of the combination rail brace and tie plate described in the ELECTRIC RAILWAY JOURNAL of June 27, 1914, on page 1467. Experience has shown that if the plate and brace are purchased separately and the two welded together on the job, considerable saving is made over purchasing the combination plate and brace from the manufacturer. At about 100-ft. intervals, or as often as required, the tie plate is made continuous from rail to rail to take the place of an ordinary cross bond. The same method of cross bonding, if desired, could be used in the devilstrip, thus providing a perfect bond from one track to the other. When steel ties are used the rail braces are welded direct to the tie, and at intervals the tie itself is welded to the base of the rail for cross-bonding purposes. In order to test thoroughly this type of construction, a piece of track 3200 ft. long was constructed of 140-lb. rail laid on steel ties except at curves. At these points the rail was laid on oak ties with ⅜-in. x 6-in. x 12-in. tie plates to which the rail braces were electrically welded. Continuous joints were used on the angle bars, and straight plates or channel plates on the tangent track. Continuous joint plates were welded at the upper surfaces and at the ends of the plates. As shown in one of the illustrations, in preparing plates for welding bolts are inserted in the two upper holes, clamps are applied to the bottom of the plates near the ends and the plates are then pressed in place. The top of the plate is welded and the bottom is spot-welded, after which the clamps are removed and the welding completed.



ELECTRIC WELDING IN CINCINNATI—OPERATORS AT WORK

ELECTRIC WELDING IN CINCINNATI—JOINT AFTER TEST

This new piece of track offered the first opportunity to obtain the exact average cost of welding joints. One pair of 32-in. plates with a 16-in. base plate was applied, at an average cost of $3.98. This included the cost of the plates, all labor, material and electric current sufficient to make a finished joint. This cost is for the channel plate construction. The average cost of welding a continuous joint was only 64½ cents, which, of course, does not include the cost of bolting the joint in place. It merely covers the cost of the laborer's time, welding steel, and the current used. The average cost of welding rail braces to the steel ties or to the tie plate was 6 cents, including labor and material used, but excluding the plates and braces. While we had but one fair day's run on this new welded track construction, one welder operator made ten complete straight plate joints and the other operator twenty continuous joints. With good conditions, it is believed one operator can easily weld from eighteen to twenty rail braces an hour.

At the recent convention of the Roadmasters' and Maintenance of Way Association of America the following officers were elected: President, P. J. McAndrews, of the Northwestern; first vice-president, Coleman King, of the Long Island; second vice-president, M. Burke, of the Chicago, Milwaukee & St. Paul; secretary and treasurer, L. C. Ryan, Northwestern. W. H. Kohmehl, Chicago, Milwaukee & St. Paul, and A. Grills, Grand Trunk, were elected to the executive committee. The next convention will be held in Chicago, beginning Tuesday, Sept. 14, 1915.

COMMUNICATIONS

The Truss Rod Fallacy

L. B. STILLWELL, CONSULTING ENGINEERS
NEW YORK, Oct. 5, 1914.

To the Editors:

I have read with interest the editorial in your publication of Oct. 3 in regard to truss rods on steel cars. While it is conceivable that the application of truss rods to certain steel cars may be found necessary on account of possible errors in the original calculations of the proper strength of the structural members of the specific car in question, their application to new cars, as part of the design, will be recognized as futile, if a little study be given to the subject.

In the diagrammatic illustration of a car shown herewith the load is assumed to be carried by the girder formed by the belt rail, the side sheathing, the side sills, and such portion of the posts as acts to stiffen the side sheathing. For the purpose of ready reference, the main members under consideration are shown in heavy lines.

If the portion of the car between bolsters is considered alone, the belt rail will be found to be under a compression strain and the side sill under a tension strain. When cars are built of wood it is customary to use a truss rod under the side sill, as it is difficult to incorporate the required continuous heavy compression member at the belt rail. In this wooden structure, with a truss rod, the heavy continuous side sill becomes the compression member and the truss rod becomes the tension member. With steel construction, however, it is obviously practical to incorporate a continuous member at the belt rail of such ample section that the stress imposed will be within the maximum desired fiber stress.

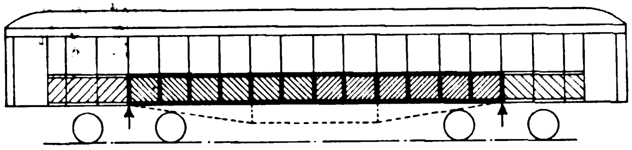


DIAGRAM SHOWING EFFECTIVE MEMBERS IN SIDE-GIRDER CONSTRUCTION

If a truss rod is applied under such a steel girder, both the sill and the truss rod can be in tension if the strain on the truss rod is carefully adjusted. It is obviously possible, however, to draw up the truss rod to such an extent as to reverse the stresses in the sill and the belt rail, producing then compression on the sill and tension at the belt rail.

Returning to the diagram of the car and considering the effects of the weight of the portion of the car body in advance of the trucks, it is observed that the stresses produced in the belt rail and in the side sill at the bolster are the reverse of those first above considered as occurring in the same members between the bolsters. In designing a car frame, the actual effect of this overhanging load must always be considered. In certain designs of cars for city service, having considerable overhang, the side sills may be altogether in compression, and in such cases the use of truss rods must be detrimental. In any case, the practical difficulty of tuning up a truss rod under a steel girder to the point necessary to cause the rod to carry only a definite proportion of the tension, is clearly apparent. Furthermore, the weight of material required for an adequate truss rod will be of greater structural value if incorporated in the proper girder members.

In conclusion, the application of a truss rod to the side girder of a steel car duplicates tension members. For this reason it will eventually create the same impression in the mind of an observer as would the application of a pair of shafts and a whip socket to an automobile.

F. M. BRINCKERHOFF.

BOSTON, MASS., Oct. 5, 1914.

To the Editors:

The "truss rod fallacy" pointed out in your last issue constitutes an interesting paradox. Frankly, it seemed to me hardly possible that the addition of metal to a structure could produce the astonishing result of weakening it instead of providing some little strength, especially when the addition consisted of such a well-known and widely used device as the truss rod. With that idea I developed a concrete case for an example, and judging by the result I have to admit that the truss rod should be relegated to a strategic position in the rear like that now occupied by the New York Giants. Under the circumstances it may be that the details of my example will interest your readers.

Assume an interurban car 60 ft. long and with truck centers of, say, 36 ft., giving an overhang of 12 ft. at each end. The framing between trucks would then have points of zero moment about 27 ft. apart. Assume the weight of body, with passenger load, to be 60,000 lb. and that the section between points of zero moment weighs, say, 27,000 lb., and also that 7000 lb. of equipment is distributed on the body framing between trucks, making the total load to produce moment equal 34,000 lb. Assume further that the side-girder type of construction is used and that the girder between sill and belt rail is 3 ft. high.

Then the load on the section of each side girder between points of zero moment (which constitutes a beam 27 ft. long) is half of the total, or 17,000 lb. Assuming that the neutral axis is midway between the upper and lower members of the girder, the moment in the center of each beam is, according to the well-known formula $\frac{Wl}{8}$, and each of the forces (tension and compression) in the sill and belt rail is (neglecting the web) approximately $\frac{Wl}{8h}$ where W equals the uniformly distributed load, l, the length, and h the height of beam. Substituting actual values, $F = \frac{Wl}{8h} = \frac{17{,}000 \times 27}{8 \times 3} = 19{,}000$ lb.

This is the amount of the compressive force in the upper member and also the amount of the tensile force in the lower member of the girder, and, if a truss rod is of any use, its installation ought to effect a decrease in both these tensile and compressive forces. Certainly it will not increase either one. Nor must it reverse the stresses to the extent that the original compressive stress is replaced by a tensile stress of greater amount or the original tensile stress is replaced by a compressive stress of greater amount. Obviously stress is stress, whether of compression or tension, because structural engineers use the same maximum figures for both, except that the safe compressive stress is reduced in the case of long columns.

Assume, then, that a truss rod is applied to the car in question without any change in the loading in any way. This truss rod assists the girder by introducing upward forces at the queen posts. To produce these forces, however, it must be set up so as to be strongly in tension, and this tension must have a reaction that appears as an equal compressive force in girder, or in other words, the pull from the truss rod tends to compress the beam longitudinally.

Owing to the presence of turnbuckles the ability of a car repairer with more beef than brains to set up the truss is limited only by the strength of the rod. Assume that the rod is 1¼ in. in diameter. Then the area is 1.227 sq. in., and if the elastic limit is 33,000 lb. per square inch the force which it can readily exert is 40,000 lb.

Now let us see what this force can do to the girder when the reaction appears in it as compression. If it is believed that the total force is divided about equally between the upper and lower members of the girder, each member will take 20,000 lb. of compression. Then, assuming that the moment remains unchanged, the original tension of 19,000 lb. in the lower member will be overcome and replaced by a compression of only 1000 lb. In the upper member, however, the original compression of 19,000 lb. will have added to it 20,000 lb., due to the reaction from the pull of the truss rod, so that the maximum stress becomes 39,000 lb., compression, instead of 19,000 before the truss rod was applied.

Now, for the sake of argument, assume that the moment at the center is reduced, by the action of the queen posts, exactly to zero. Then there will be a stress of 20,000 lb. compression, top and bottom, or 1000 lb. more than existed in each member before the truss rod was applied. Again, assume the moment fully reversed. Then the stress in the top member will be only 1000 lb. compression, but in the lower member the stress will go to 39,000 lb. compression. Therefore, in every case the presence of the truss rod, without a change in the load, has actually increased the maximum stress and thus weakened the beam.

In fact, it is impossible to conceive a set of circumstances (that are in accordance with the laws of nature and trigonometry) under which the stress will not be increased. Try a few other hypothetical cases. I did.

AMATEUR.

Insert Special Work Failures

TRANSIT DEVELOPMENT COMPANY

Brooklyn, N. Y., Oct. 2, 1914.

To the Editors:

I have noted with much interest the articles on the subject of insert special work failures in your issues of Sept. 19 and 26, and believe that the articles have served a good purpose in calling attention to the matter.

While I feel that the subject involves too much detail to discuss within the limits of a letter, there are a few points upon which comment may not be out of place. It appears that there are really three parties interested in the question, two of whom have been referred to, viz., the manufacturer and the engineer, the third being the purchasing agent. The first two cannot work together to the best advantage if the latter does not co-operate also. The reason for the failure of the purchasing department to co-operate at all times may possibly be due to the quite general lack of anything like standard specifications, which allows considerable latitude in bidding, with the result that the price often has a marked influence on the type of work ultimately purchased, disregarding, to a considerable extent, the type of construction the engineer has in mind for particular locations.

While it is doubtful whether it would be well to attempt to standardize every feature, there is little doubt but that the general dimensions of most castings and inserts, together with the character of the several metals in them, could be standardized with much benefit to all concerned, and it is therefore thought that the assignment of the subject of special work design and manufacture, for consideration by the committee on way matters of the American Electric Railway Engineering Association, would be productive of good results in this direction.

R. C. CRAM,
Assistant Engineer Way and Structure.

Tests of Automatic Train Speed Control

A public demonstration of the Horne & Crane train-control and train-stop device was held on Sept. 30 at the Cranford Junction yards of the Central Railroad of New Jersey. The tests were witnessed by a large number of engineers representing various railroad companies, signal manufacturers and the Interstate Commerce Commission. These tests were practised on a steam locomotive and were the first public application of this method of automatic train speed control by means of non-magnetic rail sections. Owing to the short stretch of track available the manganese track sections were spaced unusually near together in order to allow the locomotive a permissive speed of only 13 m.p.h. The tests, which proved successful in each case, were conducted to fulfil the three following situations: 1. Block approached occupied. Locomotive exceeded 13 m.p.h.; speed control and brakes were automatically applied. 2. Succeeding block still occupied. Locomotive reduced speed within 13 m.p.h. limit and no automatic brake application occurred. 3. Succeeding block clear. Locomotive passed speed control at fast and slow speeds without causing brake application to occur.

The object of this train-control and train-stop device is to provide a system of speed control which permits an oncoming train to approach the rear of a preceding train provided the speed of the train approaching is properly decreased as the distance separating the trains decreases. By means of the measured spacing of special sections in the running rail the speed of a train approaching an occupied block is automatically timed, and if its speed exceeds any predetermined limit at any point intervening between the distant signal and the home signal the train brakes are automatically applied under either service or emergency pressure until the train is stopped or until its speed is reduced to a certain predetermined rate of travel as may be desired by the railroad company.

The special sections inserted in the running rail are composed of ordinary manganese rolled-steel rail which is absolutely non-magnetic. Electromagnets are installed on the track in conjunction with the manganese control sections. The locomotive apparatus consists of a magnet suspended over the running rail which serves normally to maintain in closed circuit a valve connecting a timing cylinder with a source of compressed air supply. The piston of the timing cylinder times the movement of a contact disc controlling a brake pipe cut-out valve, which operation determines the speed of the train travel between manganese control sections when the block approached is occupied.

The bureau of mines of the Department of the Interior, has issued Bulletin 38 entitled "The Origin of Coal" by David White and Reinhardt Thiessen. The bulletin forms a report on an extensive investigation designed to show from microscopic examinations of coal, how far and in what ways the grouping of coal by types depends on differences in the kinds of plant material from which it was formed and on the conditions of its accumulation. The bulletin contains a chapter by Charles A. Davis on the formation of peat.

ASSOCIATION NEWS

MEETING OF WASHINGTON RAILWAY & ELECTRIC COMPANY SECTION

The first meeting of the Washington Railway & Electric Company section for the season was held on Sept. 28. The commercial department of the Potomac Electric Power Company met with the section. The principal feature was a paper by George C. Whitney, of the accounting department Washington Railway & Electric Company, entitled "The Accounting Department and Its Relations to the Other Departments." The paper provoked a lively discussion, after which informal addresses were made by Dr. Earle Wilsley and Dr. Abram Simon, ministers of local churches. In addition to felicitating the section upon the fine spirit manifested, the ministers gave summaries of recent experiences in Europe. Following the addresses, refreshments were served. E. S. Marlow, manager commercial department Potomac Electric Power Company, presided over the meeting, the minutes of which were forwarded to the ELECTRIC RAILWAY JOURNAL by B. F. Hunter, secretary of the section.

The purpose of Mr. Whitney's paper was to show how the work of the accounting department co-operates with other departments, and that its function is not to pile up a mass of unintelligible figures and reports to be filed away as records for possible future reference by the board of directors or the officers of the road. He showed by definite statements how the department can assist in improving the efficiency of the operation of the system. For example, the claim department can be furnished with facts and figures showing the causes of accidents and the facts bearing upon them, such as kinds of accidents, styles of cars, styles of brakes, service of trainmen, age of trainmen, mileage of cars, together with the cost of different kinds of accidents. Such data should enable the departments concerned to reduce accidents along certain lines. There is a close relation to the construction and maintenance departments also. The employees are apt not to associate the track gangs and their foremen with the accounting department which, however, plays an important part in figuring the cost of work and material and insuring their proper distribution. Many a dollar is lost through loitering on a job, ordering of surplus material and improper distribution of work. Similarly, the accounting department can call attention to economy in the ordering of supplies by the purchasing and stores departments.

In the work of the transportation department, the accounting department can assist by calling attention to statistics regarding accidents, and to the manner in which power is used by motormen. Through this department, the complaints of the power and substation operators to the effect that machinery is being overloaded, and that fuel cost is mounting up, can be brought to the attention of motormen. By giving figures of energy consumption per mile, or per car, on any given line and other data of this kind, the accounting department can help in reducing these costs. Again in the matter of making schedules, information can be furnished as to earnings, wages, hours, miles per line, which with the expression of these items in unit form, per car-mile, per car-hour, per passenger, per ton-mile, per seat-mile, etc., can indicate how schedules can be modified to produce greater economy. In the maintenance of buildings and equipment, the accounting department furnishes carhouse expense statements, comparative statements of operation and maintenance of substations and power plants, etc. These examples all go to show the importance of the accounting department in maintaining efficient operation of a property.

In the discussion of Mr. Whitney's paper, W. S. Ballenger, of the transportation department, stated that the instruction department drills the motormen carefully in regard to economical use of current, and the men have had careful instruction in regard to the coasting recording clocks. Special attention is called to the coasting averages by division notices. The transportation department also solicits suggestions tending to increase efficiency. The data sheets furnished by the accounting department are appreciated and are consulted when the question of increasing or reducing service is under consideration.

J. C. McLaughlin, of the commercial department, emphasized the importance of the accounting department's duty in furnishing accident data. He made a practical suggestion to the effect that a report bureau be established which would receive reports from all employees who notice defects on the property, these to be furnished on postal cards to be supplied by the bureau. George F. Mangan, of the commercial department, made the point that system is not enough in itself to produce results, and that the question in the use of any system is what use is made of the results. F. J. Mersheimer, of the claim department, urged that the accountants furnish simple statistics that can be understood and applied. L. L. Johnston, of the maintenance department, said that many of the foremen do not understand the importance of the data which they are called upon to furnish. If they did they would make a better showing for their work. A man who can do good work but cannot report properly upon it cannot expect to receive proper credit. V. A. Sisler, of the same department, mentioned some of the statements which are found especially useful, principally carhouse expense, operating expense, car accounts, job statements and manufacturing accounts. He stated that the accounting department is of great assistance to the mechanical department. W. F. Dement and C. P. King, president Washington Railway & Electric Company, also spoke.

DENVER TRAMWAY COMPANY SECTION

The September meeting of Company Section No. 3 was held in Denver on Sept. 17, 1914, with President W. M. Casey, trainmaster Denver City Tramway, in the chair. The attendance was 200. The paper of the evening was by A. F. VicRoy, superintendent Union Pacific Railroad, on the topic "Safety First on the Union Pacific Railroad." John A. Beeler, president Denver City Tramway, W. H. McAloney, superintendent of rolling stock of the same company, and others contributed to the discussion.

SECTION MEDAL COMPETITION

The committee on the section medal to be awarded by the American Association for the best paper read during the year before a company section will report on Wednesday afternoon, Oct. 14. The committee is considering the following papers: (Milwaukee section) "Purposes of a Street Railway Traffic Survey," by E. J. Archambault; "Pavements in Street Railway Track Zones," by V. W. Dentz; "Overhead Charges in Valuation," by H. G. Abendroth, and "Some Improvements in Car Design," by C. H. Cross. (Public Service section) "Maintaining the Way," by P. F. Maguire; "Training the Trainmen," by Charles H. Coe; "Some Elements Entering into Time-Table Development," by Alexander Jackson; "Inspecting the Rolling Stock," by John Hauf, and "Keeping the Company Department Store," by Robert S. Inglehart.

ENTERTAINMENT COMMITTEE ANNOUNCEMENT

Mme. Gertrude Auld, prima donna soprano of Milan, the soloist engaged for the officers' reception Monday night, though an American by birth is better known in Europe than in her own country. The foreign papers speak with enthusiasm of the quality of her voice and her great interpretative power. She made a most extraordinary success in Budapest and in Italy, where the Italians thought her singing was a return to the old school of Der Canto. Last winter she succeeded in calling forth enthusiasm of audiences in New York City with a recital on modern song.

PROPOSED INCREASE IN DUES

In the issue of the ELECTRIC RAILWAY JOURNAL for Oct. 3 an editorial commented on the proposed increase in company dues. The proposed and present schedules are as follows:

	Gross Receipts			Annual Dues	Present Dues
Under	$50,000			$25	$15
Between	50,000	and	$100,000	50	25
"	100,000	"	250,000	75	50
"	250,000	"	500,000	125	75
"	500,000	"	1,000,000	175	100
"	1,000,000	"	2,000,000	225	150
"	2,000,000	"	3,000,000	275	200
"	3,000,000	"	4,000,000	325	250
"	4,000,000	"	5,000,000	375	300
"	5,000,000	"	6,000,000	425	350
"	6,000,000	"	7,000,000	475	400
"	7,000,000	"	8,000,000	525	450
"	8,000,000	"	9,000,000	575	500
"	9,000,000	"	10,000,000	650	550
	10,000,000	"	over	750	600

South American Trip

After a two weeks' visit to New York manufacturers, H. N. Douthitt, special agent of the Department of Commerce, has returned to Washington for a short time before leaving for Rio de Janeiro, Brazil. This South American trip by Mr. Douthitt is taken at the personal suggestion of Secretary of Commerce Redfield, who thinks that a government representative will be able to obtain much information of value to American machinery manufacturers. Mr. Douthitt's investigations will be confined entirely to a study of the market in South America for general outside machinery and engineering supplies, including electrical machinery and apparatus. He will look into the matter of equipment for machine shops, but will not make any investigation of markets for textile machinery.

In talking with a representative of the ELECTRIC RAILWAY JOURNAL Mr. Douthitt said that he had lived for some time in Brazil, where he was interested in hydraulic engineering projects. As the result of this experience he concludes that American manufacturers should seek in South America a market based on the high quality of the goods produced. The quality is the best feature of American products, and this is thoroughly appreciated by South American buyers who have traded with our manufacturers. Mr. Douthitt spoke of two Westinghouse generators installed at Bellohorizonte, state of Minas Geras, Brazil, which had been cited all over the country as examples of the superiority of American machinery. They had been in operation about fifteen years, had worn out two sets of blades on the turbines, and when last heard of were as satisfactory as at the beginning. If all companies would do as certain of the large electric manufacturers have done and try, Mr. Douthitt said, to market products on the basis of high quality, they would secure satisfactory results.

While in South America Mr. Douthitt will call on the American consul in each city, with whom he will advise, and also make a personal canvass among the users of heavy machinery. He will obtain as thorough a description as possible of the machinery now in use, together with information concerning the source of manufacture, the cost and the present needs. Mr. Douthitt, with his knowledge of Portuguese, will discuss frankly the financial conditions in the various countries in order to find out whether buyers are in a position to pay cash, or, if not, what terms of credit they expect and what the countries can offer to American manufacturers in exchange for goods. The question now is not how much this country can sell to South American buyers but rather how much South American buyers will want to buy while financial conditions remain as they are.

Unless American manufacturers are prepared to have their representatives remain for a year in South America without showing a profit on sales, Mr. Douthitt does not advise the sending of representatives. If manufacturers desire to enter the South American market on this basis, however, they should secure their own representatives rather than try to do business through English and German commission houses, which already have extended connections with manufacturers in their own countries.

Electrical Openings in South America

Manufacturers of electrical machinery in New York, New Jersey and Pennsylvania have a remarkable field for development in South America, according to P. H. Burnett, industrial commissioner of the Lehigh Valley Railroad, in a bulletin recently sent out for the benefit of manufacturers along the line of the railroad. The latest census figures show that of the $221,000,000 of electrical machinery manufactured in the United States each year, $49,000,000 is produced in New York, $31,000,000 in Pennsylvania and $28,000,000 in New Jersey. The world is recognizing the value of American electrical machinery, for $27,000,000 of electrical goods were exported from the United States in the fiscal year 1913 as compared to $20,000,000 in 1912.

Mr. Burnett believes that South America affords an opportunity greatly to increase American export trade in electrical machinery, on account of three conditions, the absence of coal, the presence of plentiful supplies of water-power and the need of power to operate railways, mines and industrial plants. That the opportunity is being seized is evidenced by the fact that Brazil's importation of electrical manufactures amounted in 1912 to nearly $6,000,000 and Argentina's importation to about $4,500,000. Chile, which has special facilities for obtaining water-power, imported in the same year $2,500,000 of electrical machinery and apparatus, while the imports of other South American countries brought the total to nearly $20,000,000. Of the $4,500,000 of this class of manufactures imported into Argentina only about $130,000 was from the United States, but of Brazil's $6,000,000 of electrical imports about $2,500,000 was from the United States.

Mr. Burnett speaks particularly of the excellent opportunities in the state of Bahia, Brazil. The market there for waterwheels and turbines, electrical motors, cables, etc., is sure to be steady and growing. On the Pacific Coast the opening for the use of electrical machinery is very great. In Chile it may be expected that hydroelectric machinery will be in constant demand in view of the mountainous nature of the whole country and the numerous rivers. American machine makers will find strong competition but will probably have few better openings for future trade. A report from Venezuela emphasizes the fact that further industrial development will mean a demand for turbines and other hydroelectric machinery, and it would be well for electrical manufacturers to study the needs of this country.

Equipment and Its Maintenance

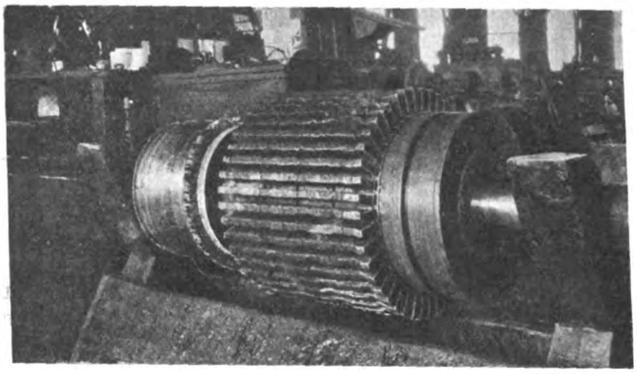
Short Descriptions of Labor, Mechanical and Electrical
Practices in Every Department of Electric Railroading

(Contributions from the Men in the Field Are Solicited and Will be Paid for at Special Rates.)

Welded End Laminations of Armatures

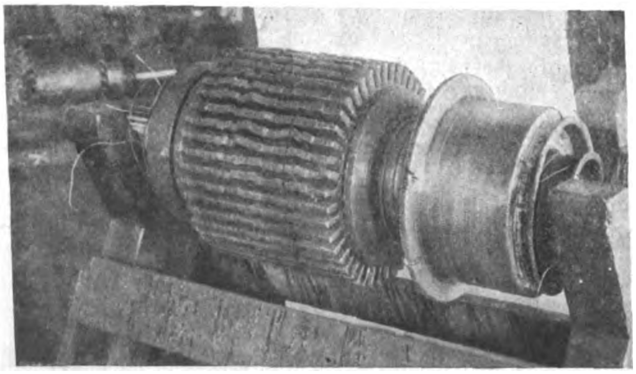
BY C. L. KELLER, ASSISTANT MASTER MECHANIC DETROIT UNITED RAILWAYS

In many of the earlier types of railway motors the laminations of the armature cores were supported and protected by the use of malleable-iron finger plates at each end of the core. These plates prevented any tendency of the core teeth to spread in the direction of the axis of the core. Later types of motors, however, are not provided with finger plates, but the support required at each end of the core is secured by making a few of the laminations of a heavier gage sheet metal than the remainder of the core.



VIEW SHOWING SEVERE TEST OF END LAMINATIONS WITHOUT CRUSHING

Our experience has demonstrated that this method of reinforcement offers a support far inferior to the old finger plates. Until a few months ago the core with flared or spread teeth was a constant annoyance. In some cases the core was made an inch longer because of this spreading effect. In this condition, perfect winding was impracticable since much pressure was necessary to force the coils into the slots, and this pressure often damaged the insulation so badly that some of the coils soon burned out.



VIEW OF ARMATURE SCARRED FOR ITS ENTIRE CIRCUMFERENCE

To prevent this trouble, a suggestion was made that the flaring teeth be pressed back in place and welded together. In this manner the end laminations would form practically a solid piece and furnish the same supporting effect as a finger plate. As an experiment, one core was welded in this manner, and the result was so successful that all spread cores are now being so treated. The process is quite simple, requiring merely that the core be set on end, in which position the laminations are welded, one tooth at a time, with an oxy-acetylene flame fed from our installation of this welding system. The welded section should have a thickness of from ½ in. to ⅝ in.

The accompanying illustrations give some idea of the remarkable strength of these welded ends. One of these cores was damaged by some object which had been carried into the air gap, with the result that a groove about ⅛ in. deep and ½ in. wide was torn around the entire circumference of the core. It will be seen that although the teeth were distorted the welded ends still remain as true and parallel as the day they were welded. The other illustration shows an armature core in which the end laminations have been subjected to a severe test without crushing. The actual cost of the welding is very small when compared to the cost of tearing down and reassembling a core, being about $7 for a core of forty-five slots. This figure includes some experimental work, and could, no doubt, be greatly reduced.

Vineville Avenue Concrete Paving, Macon, Ga.—The Cost

BY CARL H. FULLER, FORMERLY ENGINEER MAINTENANCE OF WAY MACON (GA.) BAILWAY & LIGHT COMPANY

The following is a detailed statement of the labor and material required to build 4290 ft. of track under the conditions described in my article of Oct. 3:

Labor		
Tearing up 4290 ft. of track at 3 cents per ft.		$128.70
Laying and surfacing:		
Fine grading, per foot	$0.02	
Placing ties	0.01	
Spiking and bolting	0.025	
Tamping	0.065	
Final surfacing	0.03	
Total, 4290 ft. at	0.15	$643.50
Policing and lighting		44.51
Hauling 1266 ties from stockyard, loading and unloading from service cars, 2-mile haul, at 4 cents each		51.43
Hauling rail from the stockyard, 76 tons at $0.345, or 160 bars at 10 cents each		26.21
Hauling away old material, miscellaneous hauling, cleaning up and labor not otherwise accounted for, 4290 ft. at 4 cents per ft.		51.56
Installing 266 bonds at 15.4 cents		40.97
Drilling and placing 400 ft. of guard rail, at 5½ cents per ft.		21.95
Total labor on 4290 ft. of track, at 23½ cents per ft.		$1,008.83
Material		
1266 No. 1 loblolly yellow pine ship pine ties, at 60 cents each		$759.60
260 bars 60-lb. A. S. C. E. rail, at $9.72 each ($33.25 per ton, or 59 cents per ft. of track)		2,527.30
400 ft. of guard rail at 53 1/3 cents per foot		213.33
Two pairs compromise joints at $6.70 each		13.40
260 pair 60-lb. angle bars at 58 cents per pair		150.80
266 9-in. concealed No. 0000 stranded bonds at 43 cents each		114.38
1100 nutlocks at 78 cents per 100		8.58
Eighteen kegs 7/16-in. x 5½-in. railroad spikes at $4.87 per keg		87.75
Six kegs track bolts at $4.90 per keg		30.91
Depreciation on tools		20.14
Lanterns and oil		10.64
Total material for 4290 ft. track at 91.7 cents per foot		$3936.83
Total labor and material, 4290 ft. at $1.15 1/3 per foot		4945.66

All rail was 33 ft. long and laid "broken joint" or "joint and center." Ties were placed two under each joint making a suspension joint, with four between, practically 3 ft. centers and requiring 1560 ties for the job. Of these ties, 294 found in the old track were considered sound enough to use again. As we have repeatedly uncovered ties incased in concrete from twelve to sixteen years and found them in fairly good condition we used no wood preserver, believing that because of the rigid monolithic construction of the pavement, which thoroughly incases the ties and rail in the cement, the ties would last as long as the paving itself. As the life of the paving could not exceed the average useful life of railway track, say twenty years, we did not consider it economy at this time to increase the initial cost of the work to obtain a result which would not be warranted by the life of the paving and the rail.

It will be noted in the tabulated costs that labor for laying and surfacing amounting to 15 cents per ft. is further subdivided into the various operations, but these subdivisions can only be considered relatively approximate as the transition from one operation to another is almost imperceptible. The rough grading and hauling away of excavated material by the city convict gangs, a service for which no charge is made against the job by the city, resulted in a saving to the traction company of 1324 yd. of original excavation which would have cost in the neighborhood of 15 cents per ft. of track.

The cost of installing 266 9-in. concealed, stranded No. 0000 bonds with compressed terminals under splice plates, the holes being drilled with a Duntley electric track drill and terminals compressed with a screw press (see article in July 25 issue of this journal) including replacement of two plates and four bolts tight ready for paving averaged 15.4 cents each for the job. On one day with everything in their favor the two men who operated this outfit placed thirty bonds in ten hours at a cost of $2.75, or 9 cents per bond.

The track laying gang averaged fourteen men and foreman. This work was done in forty-nine working days although the paving operations covered 103 days, including Sundays and delays. Track men received $2, $1.50, $1.35 and $1.25 a day of ten hours. No engineering or overhead is charged against the job.

The city paving gang did the actual paving. After one side of the street had been fine-graded for quite a distance, the 12 cu. ft. batch mixer was placed to control from 150 ft. to 200 ft. of paving and the material required was hauled in behind it. All sand was screened to remove foreign matter. Ordinarily, eight men were required to supply the mixer with material, two men to operate the mixer and six men to handle the concrete from mixer to grade, while three men tamped and raked it to grade, smoothing it first with long-handled spades and finishing with a long-handled wood float. There were usually about twenty-six men in the gang, the surplus being disposed as required. All were paid at the rate of $1.25 a day of ten hours.

The total actual area paved amounted to 11,957.8 sq. yd., having a cross section as shown in the sketch in the first article, being 8 in. on the sides and 11 in. thick from the bottom of the tie to the top of the rail in the track. In order to reduce our cost data to surface yard measurement we will change the extra 3 in. in the track to surface yards, which gives us a total of 15,306 sq. yd. The material for this cost appears at the bottom of the preceding column.

3775 bbl. of cement at $1.68, f.o.b. Macon or 0.42 bbl. per yd.	$0.42
Hauling from car to job at 8 cents per barrel in cloth sacks, sub-contract	0.02
1500 yd. of sand delivered on the job at 70 cents	0.07
3500 tons crushed granite, f.o.b. Macon, or 0.23 tons per surface yard, at $1.83 per ton	0.42
Hauling ⅝ mile from car to job at 40 cents	0.09
Material for 7500 ft. of expansion joint	0.02
Miscellaneous material, lumber, gasoline for mixer, etc.	0.01
Giving a total of $16,028.77, or per square yard of	$1.05

Reducing the foregoing figures to cubic yard costs we have 3400 yd. of concrete at $4.71 for material.

The labor to handle, mix and place this material cost in detail per surface yard as follows:

Superintendence (no engineering)	$0.026
Screening sand	0.006
Expansion joints	0.002
Fine grading	0.25
Loading and charging mixer	0.017
Operating mixer	0.009
Placing concrete	0.025
Finishing and surfacing	0.013
Miscellaneous labor, moving mixer, etc.	0.023
Making a total of $2259.65 or per sq. yd.	$0.346

Reducing the foregoing figures to a cu. yd. basis we have 66 1/3 cents for labor. These figures give us a total cost of $5.37 per cu. yd. of concrete or $1.396 per surface yard in place.

The cost of this work was divided among the property holders, city and railway company as follows:

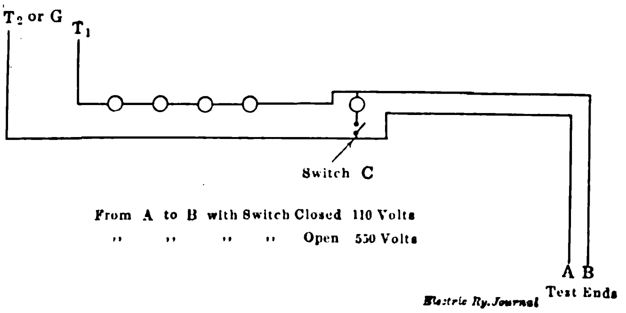
Macon Railway & Light Company, all inside of tracks and 1 ft. on the outside, or 4081.3 sq. yd., at $1.396	$5,694.49
Macon Railway & Light Company, 28 per cent. excess concrete in above	1,595.30
City one-third of remainder, or 2625.5 yd.	3,665.21
Property holders two-thirds of remainder, or 5251 yd.	7,330.42
Or, 11,957.8 sq. yd. of paving	$18,288.42
TOTAL COST FOR MACON RAILWAY & LIGHT COMPANY	
4081.3 yd. paving	$7,292.79
Labor and material for 4290 ft. of track	4,945.66
Total, 4290 ft. of track at $2.85 per lin. ft.	$12,238.45

The city engineer, Col. J. J. Gilliard, prepared the specifications for the paving while his office performed all engineering work required, and during construction the work was subject to his constant personal supervision. Dr. W. G. Lee, chairman of the aldermanic street committee, through his influence and energy made the job possible and also gave the work considerable detail attention. The writer as engineer of way for the railway gave personal supervision to the latter's part of the work and also kept detailed cost records for the job as a whole.

Standard Five-Light Series Cluster for D.C. Test Voltages

BY R. H. PARSONS, ELECTRICAL FOREMAN

A very convenient means for voltage tests is afforded by using a five-light cluster of the type found in most shops and carhouses where 550 volts d.c. is the standard.



WIRING FOR TEST WITH FIVE-LIGHT SERIES CLUSTER

The accompanying sketch shows how either 110 or 550 volts can be obtained by the use of such a cluster. Glancing at the sketch it will be seen that when the switch *C* is open there is no circuit for current, but that the difference of potential of 550 volts between *B* and *A* is available. Should this voltage break down the insulation under test, the circuit thereby created will cause the lighting of the lamps, allowing to pass through the break only as much current as would pass through the five lamps, namely, a little less than ½ amp. At the same time the voltage across *B* and *A* would be reduced to zero.

When switch *C* is closed a complete circuit is formed through the five lamps lighting all at the same time and giving a drop of 110 volts across *A* and *B;* or, to be more exact, the difference of potential would be approximately 100 volts, depending on the line voltage and the resistance of the lamps.

When using the test wires *A* and *B* with the switch closed the five lamps are lighted, and we have 110 volts for testing. Then in case of a breakdown of the insulation, or of placing the ends of these wires across a closed circuit, the lamp nearest the switch *C* will go out. Thus we would get through *AB* that current which would pass through four lamps in series, or a little more than ½ amp. A single-blade snap switch is used.

This plan is convenient for testing circuits at the bench, as on controller work, testing coils and commutators, etc. By using long leads it is also made available for pit work. To adapt a regular cluster for these purposes, remove one of the lamps and replace it with a plug and twin wire cord. Then run the cord to a suitable place over the bench or on the wall where the switch, another lamp, and the test leads can be installed. A convenient method would be to extend a bracket from the ceiling or wall adjacent to the bench and install the switch lamp and leads directly over the bench at a place easily reached by the workman.

Eliminating Crossed Grounding Currents in a Motor-Generator Set

BY J. G. KOPPEL, ELECTRICAL SUPERINTENDENT OF BRIDGES, SAULT STE. MARIE, ONT.

The following incident, which occurred during the equipment of a substation at Chambly Basin, Que., for the Montreal & Southern Counties Railway, may be of special interest to those who are connected with such installations. This station was designed to run in parallel with another substation at Ste. Lambert, about 12 miles distant. Energy is received at 25,000 volts three phase, sixty cycles, and transformed through one set of three 185-kva single-phase oil-insulated, self-cooled transformers, with 2300-volt delta-connected secondaries. At the latter voltage energy is delivered to a 600-hp polyphase slip-ring induction motor with stationary primary and revolving secondary, while the d.c. end of the set is a 400-kw commutating-pole, compound wound 600-volt generator.

When everything had been completed to the point of cutting in the current and starting up the machine, a ground wire was connected to the motor-generator frame as a precaution against possible danger, particularly when starting the machine for the first time. As soon as the oil switch was operated to cut the current in the motor a strong flash was visible between the grids in one of the three groups of starting resistance mounted over the starting panel. The oil switch was opened immediately thereafter, but the appearance of the resistance grids failed to indicate that anything was wrong. The manufacturer's representative then asked us to remove the ground wire from the motor-generator frame. The current was then cut in again, and the motor-generator ran all right.

Following a satisfactory test run the motor-generator was placed in regular service, but after operating for two weeks the bearings started to run hot. On starting up the machine one dark morning a long spark was seen to follow the oil rings in the bearings, and when the end cups were removed from the bearing ends a spark was visible around the armature shaft in the bearing ends. The machine was then shut down and the bearings taken apart. It was found that the shaft had been badly roughened while big holes had been burned in the bearing babbitt. A careful investigation disclosed that a ground in one of the resistance grids, namely, at *X* in the accompanying diagram, was responsible for the burns in the shaft and bearing.

The trouble arose as follows: On starting up the machine a certain amount of current would flow to ground from the motor armature, which was star-wound with grounded neutral, and, since the resistance also was grounded, currents of different character and phase were set up in opposite directions. The discharge between these two currents was through the oil film in the bearings. Not only did this arc break down the oil film, but it also burned the bearing and armature shaft enough to cause hot bearings.

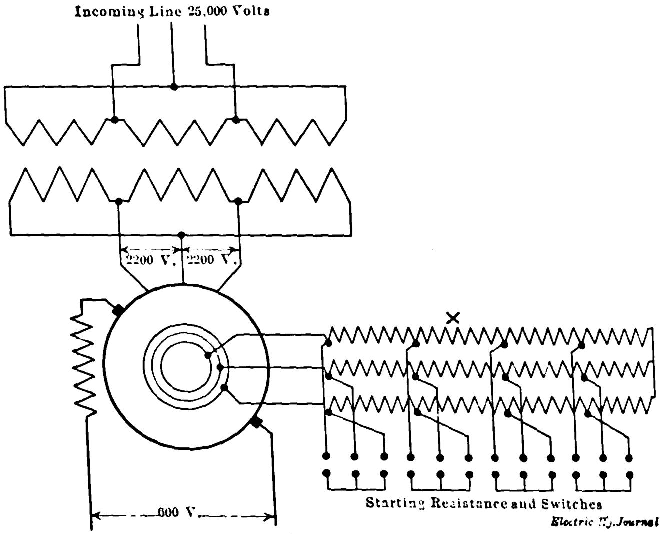


DIAGRAM OF MOTOR-GENERATOR SET, SHOWING LOCATION OF GROUNDING POINT IN STARTING RESISTANCE

To correct the trouble the bearings were scraped, the shaft was polished with carborundum, the oil was replaced with fresh liquid, the ground was removed from the resistance and the motor-generator frame was earthed with a good grounding wire. Finally, we placed in the rotor a grounding brush in a medium-sized brush-holder. This holder was so mounted on the motor-generator frame that the carbon brush could make a sliding contact with the rotating armature shaft. Since these changes were made the motor-generator has run without any arcing or hot bearings.

British Ideas on Cab Signals

The British Board of Trade report upon accidents on railways in the United Kingdom during 1913 draws special attention to the use of electricity in preference to gas in railway carriages, and also to the necessity of adopting means to safeguard against mistakes by signalmen and locomotive engineers. Regarding the latter, a memorandum was prepared towards the end of last year by the inspecting officers and submitted to the various railway companies urging them to extend the use of electric track circuits in connection with the control of signals, and to carry out combined experiments with different systems of cab signaling and automatic control with the object of supplementing the present system of semaphore signaling.

A Complete Progress Profile Used by an Iowa Interurban

The Waterloo, Cedar Falls & Northern Railway, Waterloo, Iowa, is just completing a 60-mile extension to its lines between Waterloo and Cedar Rapids. In connection with this construction work a complete progress profile was desirable to give the management a diagrammatic record of the work done each week. To meet this requirement a complete form of progress profile has been devised by T. E. Rust, chief engineer of this road.

This profile is shown in the accompanying illustration, and is standard correspondence paper size. In it the entire road is covered by a series of sheets, each including about 6 miles of line. It will be observed that besides containing the usual profile and grade line with a color key for each month's grading, space is provided for actual pay quantities per week, per month and the total. In addition to the concrete openings there are included timber bridges, track laying, ballast overhead lines and an alignment map. Each of these designations is colored by the different resident engineers, in accordance with the progress made on the division in their charge and sent to the chief engineer's office regularly each week.

The record sheet is about 9 3-4 in. wide by 8¼ in. high, with a 1-in. margin at the left for convenience in binding.

An Effective Fire-Bucket Rack at East St. Louis

An inexpensive and convenient fire-bucket rack has been designed and built by the mechanical department of the East St. Louis & Suburban Railway. It has been standard practice for this company to provide wooden shelves for this purpose throughout its shops and carhouses. In many instances the location of these shelves was such as to form a convenient shopmen's catch-all. In order to make it impossible to utilize these racks for storage shelves, the strap-iron racks shown in the accompanying illustrations were made for two 14-qt. buckets, at a cost of approximately 76 cents each. They are made of forged strap iron riveted together.

For Ending

Report is to be sent to the Chief Engineer on Monday of each week and as soon after the first of each month as practicable. On Profile color up total work done to date of report. Monthly reports to be made from monthly estimate data.

PROGRESS PROFILE, INCLUDING DESIGNATIONS FOR CONCRETE WORK, WATERLOO, CEDAR FALLS & NORTHERN RAILWAY

Block Signals on the Kansas City, Clay County & St. Joseph Railway

This 1200-Volt, High-Speed, Interurban Railway Has Recently Placed in Service a Complete System of Automatic Block Signals Which Is Described in Detail by the Author, Who Includes Figures Covering the Total Cost of the Installation

BY ROBERT P. WOODS, CITY MEMBER BOARD OF CONTROL, KANSAS CITY RAILWAYS COMPANY

An automatic block signal system recently completed on the Kansas City, Clay County & St. Joseph Railway, under the direction of the writer, embodies some features of interest in signaling on electric railways. This road is a 1200-volt d.c. line, doing an exclusive interurban business and operating frequent trains at high speed. After about two years of consideration as to the system and the type of signals best adapted to the conditions, J. R. Harrigan, general manager of the company, directed that contracts be entered into for the installation of an absolute automatic block signal system with continuous, alternating-current, track circuits. It was decided also that current should be provided for station and switch lights along the whole route. The Union Switch & Signal Company's apparatus was used.

The road consists of two single-track divisions, both extending from Kansas City, Mo., one northeast 28.35 miles to Excelsior Springs and the other northwest to St. Joseph, a distance of 52.44 miles. The length of track outside of terminals on the Excelsior Springs division is 24.5 miles, all of which has been included in the signal system. This division has been divided into nine blocks varying in length from 6950 ft. to 18,704 ft. The predominant length of block is about 15,000 ft. The length of track under the signal system on the St. Joseph division is 46.6 miles, which also includes all track outside of terminals. This division has been divided into sixteen blocks varying in length from 6154 ft. to 23,201 ft., with about 15,000 ft. as the predominant length of block.

Each block in the signal system, which is of the Union Switch & Signal Company's "T-D-B" type, is a unit in itself, and cars occupying one block have no control over signals in an adjoining block, following movements being provided for by having intermediate signals located about 1000 ft. either side of the center of the block, thus providing for the operation in the same direction of two trains in the same block and both being protected by absolute signals.

At each siding there are placed two semaphore signals, one for each direction of traffic. These semaphores are electrically operated and for night indications are lighted with two 2-cp lamps. The semaphores are of the Style B one-arm, two-position type, operating from 0 deg. to 60 deg. in the upper left-hand quadrant, indicating "Stop" at 0 deg. or horizontal and "Proceed" at 60 deg.

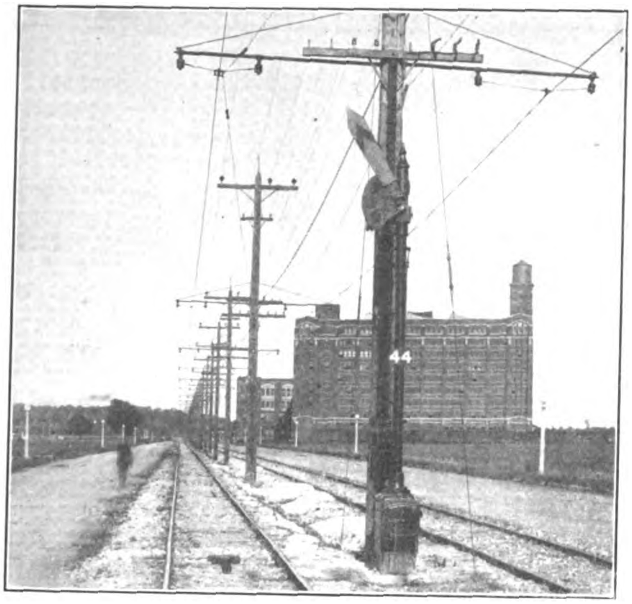
About 1000 ft. on either side of the center of block, depending upon the block length, is located an intermediate light signal of the Model 13 type, provided with one red and one green lens, each about 8 in. in diameter, and hooded for daylight indications. Two 25-watt lamps are used for each of these indications.

At two sidings which are used for light freight operations only, there have been installed switch indicators. These indicators are small unlighted semaphores, each mounted in an iron case on a 4-ft. stand, and they always indicate "Stop" to trains occupying the siding. Before a car leaves one of the sidings the trainman must open the case and throw the indicator into circuit; if the block is not occupied the small semaphore will go to "Proceed" and must be held in this position

K. C., C. C. & ST. J. SIGNALS—INTERMEDIATE LIGHT SIGNAL AT CURVE IN ROCK CUT until the car passes out on the main line, thus setting the home signals at "Stop" and giving the car that leaves the siding the right-of-way in the block. The switch indicators do not indicate any movements into the siding from the main line.

The overhead wiring for this system consists of two No. 6, 40 per cent, copper-clad wires for the transmission system, which is 2200-volt, single-phase, twenty-five-cycle; and three No. 10, copper-clad, 30 per cent wires for the 110-volt control wires. There are two additional wires of the same voltage from the center of the block to each of the intermediate light signals. Where station lights are provided an additional wire from the nearest line transformer is necessary.

Insulated rail joints of the Keystone type are placed in the track at the end of each block, confining the signal track circuits, and impedance bonds of 500-amp capacity are placed in the track to take care of the return propulsion current. All of the old cross-bonds in the track were removed.



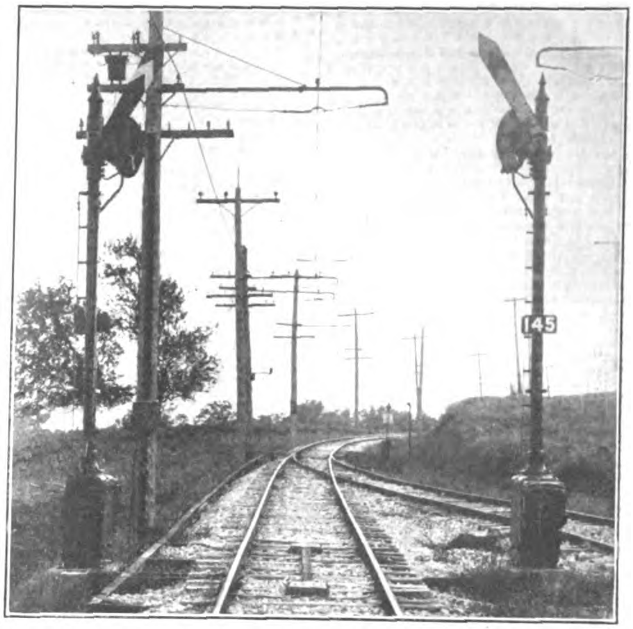
K. C., C. C. & ST. J. SIGNALS—HOME SIGNAL REAR END OF LONG SIDING IN CITY STREET

Power for signal operation is obtained from the 730-volt side of the main substation transformers, a double-throw switch being provided for taking power from either bank. At the substation on the Excelsior Springs division, two 15-kva, 730—2200-volt, twenty-five-cycle, single-phase transformers have been installed with a single panel switchboard for controlling the signal current. Similar installations were placed in the two substations on the St. Joseph division, except that at the second station two 10-kva transformers were used instead of the larger size. Line transformers are installed along the line to step the 2200-volt signal transmission current down to 110 volts for signal controls and to 12 volts for track circuits. Vane type relays are used for the line and galvanometer type for the track circuits.

All shelter stations and switch stands are electrically lighted, the shelter lights being taken from the 110-volt taps on the line transformers and the switch lights from the 12-volt taps of these transformers. The switch lanterns are provided with two 2-cp Mazda lamps. The shelter stations each have one 40-watt Mazda lamp. Individual 2200—110-volt transformers are used at the three depots for lighting these stations.

Trains are operated on orders from the dispatcher and the signals are additional safeguards against misinterpretation or mistaken orders. A red signal light indicates "stop" and a green light "proceed." In case of a signal giving an indication contrary to the train order, the dispatcher is called and the order verified, because a block signal at "stop" may indicate: (a) a train is in the block; (b) an open switch in the main tracks; (c) a car outside of the clearance point on siding; (d) a broken rail; (e) failure of the system; (f) a broken bond.

The operation of a typical block may be better understood by referring to the diagram on the next page, which shows the block between Avondale and Maple Park on the Excelsior Springs division. This particular block is 18,704 ft. long and the distance between intermediates is 2604 ft. With no trains occupying the block the signals assume proceed indications. Assuming an east-bound car entering the block at Avondale, east-bound home signal 54 and opposing west-bound home signal 91 and west-bound intermediate signal 75 go to the stop indications. The east-bound intermediate signal 70 will indicate stop when the car is within about 400 ft. of the center of the block, and when the car passes a point about 400 ft. beyond the center of the block east-bound home signal 54 will clear, thereby allowing a following movement from Avondale and at the same time protecting the first car from the rear. East-bound intermediate signal 70 and west-bound home signal 91 will not clear up until the car has passed out of the block or entered the siding at Maple Park, and obtained clearance with the main line. The intermediate signals lend an additional safeguard, as in the case of two trains entering the block, one at Avondale and the other at Maple Park, at one time, both intermediates would indicate "stop" and the trains would be held.



K. C., C. C. & ST. J. SIGNALS—VIEW OF HOME SIGNALS AT SIDINGS, SHOWING FRONT AND REAR ASPECTS

Located at each switch is a switchbox which is connected to the closed point of the switch, and when the switch is opened the signals in the adjoining blocks show stop indications. The box may be so set that any desired opening of the track switch will operate the signals. An illustration shows the circuit plan for a typical block.

In Table I is a detailed estimate of the construction of the entire signal system and, as the work is now practically completed, represents the cost of the work. The Union Switch & Signal Company furnished and installed all semaphore and light signals, line transformers, relays, impedance bonds, trunking and all necessary connections. The concrete foundations were

TABLE I—DETAILED COST OF SIGNAL INSTALLATION ON KANSAS CITY, CLAY COUNTY & ST. JOSEPH RAILWAY

Material and labor by the Union Switch & Signal Company	$73,000
Material and labor by Kansas City, Clay County & St. Joseph Railway:	
132 cu. yd. crushed stone (delivered), at $2.50	330
66 cu. yd. sand (delivered), at $2.00	132
198 bbl. cement, at $2.00	396
130 miles No. 6 H. D. C. C. 40 per cent bare wire, 50,700 lb., at 16 cents	8,112
262 miles No. 10 H. D. C. C. 30 per cent bare wire, 40,348 lb., at 15 cents	6,052
18 miles No. 10 H. D. C. C. 40 per cent bare wire, 2772 lb. at 16 cents	443
146 70-lb. Keystone insulated rail joints, at $6.00	876
10 75-lb. Keystone insulated rail joints, at $6.40	64
4 transformers for substations, 15 kva, at $200	800
2 transformers for substations, 10 kva, at $150	300
3 single-panel switchboards for controlling signal circuits, at $125	375
325 lb. 24-in. tie wire, at 16½ cents per pound	53
400 lb. 14-in. tie wire, at 16½ cents per pound	66
6300 porcelain insulators (2300-volt line), at 7 cents	441
11,100 porcelain insulators (110-volt line), at 4 cents	444
600 "J" pins at 25 cents	150
Changing feeder cross-arms to obtain clearance for 2200-volt a.c. signal wires:	
2840 three-pin, 3½-in. x 4½-in. x 5-ft. fir arms (replacing present 4-ft. arms), at 34 cents	965
8520 1½-in. x 9-in. locust pins, at 2 cents	170
5680 ¼-in. x 1¼-in. x 18-in. galvanized iron braces, at $50 per thousand	284
Miscellaneous bolts and lags	100
Labor substituting new arms, 71 miles, at $10	710
Labor stringing 410 miles wire at $10	4,100
Labor installing switchboards and transformers at substations	225
Changing poles and guys for clearance	350
Telephone interference	750
Transportation of men and materials	950
Bonding and installing insulated joints	600
Increasing track centers at sidings	750
Engineering and contingencies	4,500
Total	$106,490

built by the signal company with materials furnished and delivered by the railway company. The railway company furnished transportation for the distribution of all materials and apparatus and did all else including the supplying of poles, wires and line fixtures. All the line-construction labor and the furnishing and erection of all substation transformers, switchboards, and lighting fixtures were also furnished by the railway company. The contract for the equipment was entered into on Feb. 14, 1914, and the signals were placed in operation on the Excelsior Springs division on July 11, 1914, and on the St. Joseph division during the latter part of September, 1914.

The estimated power consumption taken at the switchboard in each substation on the 2200-volt side, is as follows: The Excelsior Springs division, which comprises nine complete blocks, or 24.5 miles of protected track, has nine electrically lighted switchstands and forty-six 40-watt station lights. It will consume under normal conditions 8.1 kw. When all signals are clearing, that is all motors are operating, the maximum demand is estimated at 12.2 kw.

At the first substation on the St. Joseph division, which controls nine complete blocks, or 23.4 miles of track, there are eight electrically lighted switchstands and seventeen 40-watt station lights, and the consumption is estimated at 7 kw. with an estimated maximum demand of 11 kw. At the second substation on the St. Joseph division, which controls seven complete blocks, covering 23.2 miles, there are seven electrically lighted switchstands and twenty-six 40-watt station lights, the estimated power consumed is 6.1 kw normally, or an estimated maximum of 9.7 kw with all signals clearing.

A summary covering the installation of signals and shelter station lighting is as follows:

Total miles of track protected	71.1
Number of blocks operated	25
Number of semaphore signals	50
Number of intermediate light signals	50
Number of switchstands lighted	24
Number of shelter stations lighted (one light each)	51
Estimated cost of lighting	$3,900
Total cost of signal system, including switch lighting, but exclusive of station lighting	$106,490
Cost per mile of track protected	$1,500
Cost per block complete	$4,250

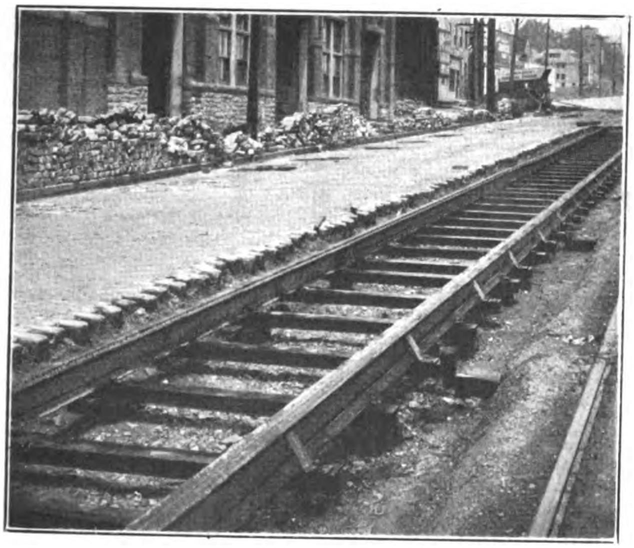
K. C., C. C. & ST. J. SIGNAL—TYPICAL CIRCUIT PLAN

Electric Welding in Track Repairs

The Author Outlines His Experience with Electrically Welded Frogs and Rail Joints, Giving Details of the Time Required and Current Consumed in Completing Different Pieces of Work with a Portable Electric Welding Outfit

BY F. J. VENNING, SUPERINTENDENT OF CONSTRUCTION CINCINNATI TRACTION COMPANY

In July, 1913, the track and roadway department of the Cincinnati Traction Company received its first portable welder from the Indianapolis Switch & Frog Company. A demonstrator was sent to Cincinnati to instruct our man in operating the outfit. We immediately began the building up of manganese centers in frogs, switches and mates with very good success at first, although our men, as their experience increased, became more proficient in the use of the welder and greatly improved the quality of their work. In a very short time we could see the value of the apparatus and secured a second welder in October, 1913. At this time we set about with the new machine to fill up some open joints in a 2-mile piece of double track laid with relay rails in 1910. Every open joint was closed, thus making a continuous rail for the entire distance. In all the joints thus filled, we have had but one failure and that was due to improper plugging before the joint was welded or filled. After this work was done the welders were kept at work continuously and with increased success on worn-out special work and manganese centers in frogs and crossings.

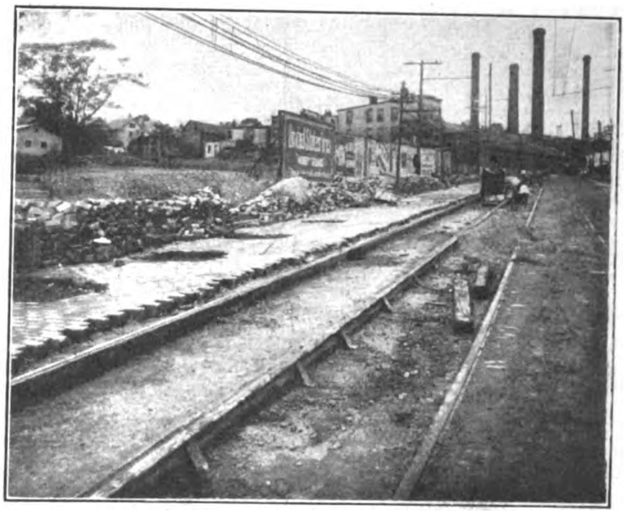


ELECTRIC WELDING IN CINCINNATI—ELECTRICALLY-WELDED RAIL BRACES AND TIE PLATES ON OAK TIES

During the winter I became personally interested in the welder and followed the work carefully. One of our first important jobs included the building up of twenty broken expansion joints on a viaduct. These were originally made by cutting the rail-ends vertically for about 10-in., and lapping the ends. They were badly battered in some cases and one-half of the head was broken off in others. The repair work included building up all joints to their normal section and replacing the missing sections. This work is to-day in as good condition as it was when completed.

On another job we built up and reclaimed two double-track, double crossovers that were in such a dilapidated condition that renewals would have been necessary if the repairs had been unsuccessful. In some instances as much as 10 in. of the head of the rail at the joint was entirely gone. The method used in this instance was to weld two strips of iron on top of the joint plate and then to build a new head on the rail.

Little or no difficulty has been experienced in obtaining successful results where the welding was done on ordinary open hearth or Bessemer steel rails, but on the manganese inserts and in solid manganese layouts the process is somewhat different. After careful study and a number of tests, it has been found that the maximum success is obtained in repairing work of this type when the amount of metal added at one time is small and the whole quenched at frequent intervals. This keeps the temperature of the manganese insert or manganese casting below the critical point, thus insuring that no change takes place in wearing qualities after the new material has been added.



ELECTRIC WELDING IN CINCINNATI—ELECTRICALLY-WELDED TRACK READY FOR CONCRETING

ELECTRICALLY-WELDED FROGS

As a rule the Cincinnati Traction Company renews defective insert special work or solid manganese pieces in a large layout with built-up work made of open-hearth standard rail sections. These pieces generally last about as long as the rest of the layout, making it possible to renew the whole at one time. Prior to December, 1913, we had all frogs made at a local shop, the company furnishing the rail and templets from which any piece was to be made. During December, 1913, we concluded that we could make this class of frog cheaper and in much less time, and at the same time could manufacture a better article by using the electric welder, and we found that shop-made frogs which formerly cost us from $45 to $65 could be manufactured for from $16 to $23. Moreover, the shop-made frogs were merely bolted together, whereas our frogs were bolted and welded, making a frog that could not possibly be shaken nor hammered apart, all parts acting as a unit.

Wherever these frogs have to perform heavy duty we burn away the intersecting parts of the head of the rail with the carbon electrodes and build up the parts so removed with hard steel. By this method we supply a harder metal at the excessive wear points and the result has been very satisfactory. Between December, 1913, and May 1, 1914, we built and installed twenty-four electrically-welded frogs, and none have given any evidence of failure in any of the welds. However, if any of these electrically-welded frogs should develop defects, or should begin to show indications of wear or cupping at the intersecting flangeways, we expect to restore the points by welding on hard steel.

It might be stated that the frogs shown in the illustrations were made practically by two men who did the sawing and fitting, and by a blacksmith bending the plates. All the sawing was done by hand, the only machine work required being that of drilling the few bolt holes. Since this was experimental work no special time was set for the welding, but it was done on rainy days and during extremely cold weather when it was impossible to work men outside.

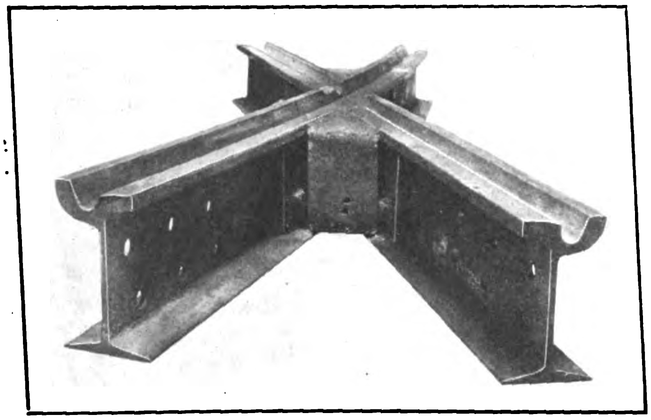
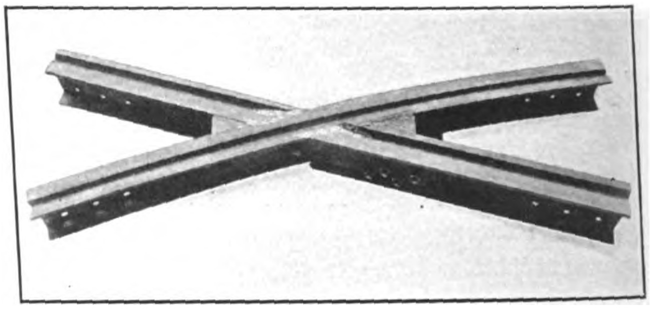
ELECTRIC WELDING IN CINCINNATI—VIEW OF THROUGH FROG



ELECTRIC WELDING IN CINCINNATI—VIEW OF FROG SHOWING PAVING CHUCK



ELECTRIC WELDING IN CINCINNATI—JUMP CROSSING WITH BUILT-UP FLANGEWAYS

In order to determine accurately the exact cost of frogs built in this manner the Cincinnati Traction Company arranged for an energy-consumption test to be made by the electrical engineering department of the University of Cincinnati. The instruments used were a Westinghouse graphic-recording ammeter, a portable Weston ammeter and a wattmeter. In the test for welding together a frog there was 308 lineal inches of welding. The average current required was 170 amp and the total energy consumption to complete the entire welding process was 161.7 kw-hr. The time consumed in welding the frog was three hours and four minutes, and all of the welding was done with the panels of the welder in parallel. In an experimental run made for a few minutes with only one panel in the circuit, the current consumption was 90 amp. With this, however, the arc was not of sufficient density for heavy welding, but could be used for light welding on thin metal. Other overhead charges added to the total cost of making one of these frogs include that of preparing the drawings and making the templet.

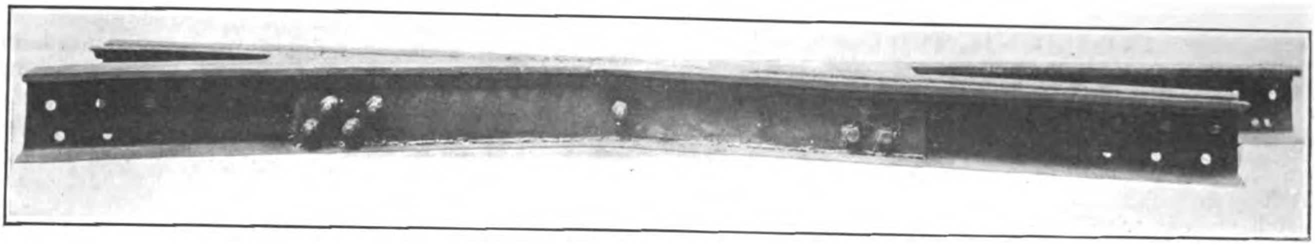
ELECTRICALLY-WELDED JOINTS

The standard rail-joint used by the Cincinnati Traction Company for some time past was of the cast-weld type, and prior to the adoption of the 140-lb. girder-grooved rail section as our standard, we had extremely good results with the cast-welded joint. Out of 10,000 joints installed between 1907 and July, 1913, our percentage of failures was 1.76. However, since the adoption of the 140-lb. rail section, failures of cast welds have greatly increased, and in view of this fact we are of the opinion that the limit of the cast-welded joint is exceeded when it is used on this rail section.

In cases where a cast-welded joint fails we knock off the cast weld and apply a standard channel plate by electrically welding it. This plate is welded to the rail after it has been drawn securely into position by inserting two of the four bolts. If an open joint has developed, due to expansion and contraction, we electrically weld the opening, filling in with hard steel, thus making the rail continuous. Since the electrically-welded plates have been introduced on this property the rail has been made in continuous lengths up to 1000 ft., one piece approximating 1 mile in length.

By the application of the electrically-welded channel-bar and the closed joints, we have not only eliminated joints but also copper bonds. Should a rail break due to contraction after it has been welded in this manner the same method would be used in making the joint at the broken point. It makes little difference whether the opening is 1 in. or 6 in. at the point of the break, because a piece may be inserted and the three sections solidly welded to the plate, thus making the rail continuous, as before.

At the time when the energy consumption was de-



ELECTRIC WELDING IN CINCINNATI—FROG OF 9-IN. TRILBY RAIL—NOTE WELDED PLATE

termined for the electrically-welded frog, a similar test was run on the electrically-welded joint. This joint is made up of standard plates, 32 in. long, designed for the Lorain steel section 140-402. In addition to these plates one-half of a plate taken from a 109-lb. rail section is welded to the base of the rail. In order that the results of this test might be comparable with working conditions on the street, the test weld was made in a section of skeleton track. During the period of the test the ammeters registered at beginning, with resistance of welder cold, 190 to 195 amp. This continued for about ten minutes until the resistance heated, at which time the current settled to a point between 165 and 170 amp, the average consumption for the entire joint being 169.3 amp, with readings taken every minute. The time consumed in welding the joint complete was one hour and ten minutes, thus making the actual energy consumption 79.2 kw-hr. per joint.

WELDED TRACK CONSTRUCTION

Recently we have developed what we consider an ideal track construction in which electric welding largely enters. This may be constructed with either wood or steel ties, but where wood ties are employed tie plates 3/8 in. x 6 in. x 12 in. in size are used on every fourth tie. These tie plates take the form of the combination rail brace and tie plate described in the ELECTRIC RAILWAY JOURNAL of June 27, 1914, on page 1467. Experience has shown that if the plate and brace are purchased separately and the two welded together on the job, considerable saving is made over purchasing the combination plate and brace from the manufacturer. At about 100-ft. intervals, or as often as required, the tie plate is made continuous from rail to rail to take the place of an ordinary cross bond. The same method of cross bonding, if desired, could be used in the devil-strip, thus providing a perfect bond from one track to the other. When steel ties are used the rail braces are welded direct to the tie, and at intervals the tie itself is welded to the base of the rail for cross-bonding purposes. In order to test thoroughly this type of construction, a piece of track 3200 ft. long was constructed of 140-lb. rail laid on steel ties except at curves. At these points the rail was laid on oak ties with 3/8-in. x 6-in. x 12-in. tie plates to which the rail braces were electrically welded. Continuous joints were used on the angle bars, and straight plates or channel plates on the tangent track. Continuous joint plates were welded at the upper surfaces and at the ends of the plates. As shown in one of the illustrations, in preparing plates for welding bolts are inserted in the two upper holes, clamps are applied to the bottom of the plates near the ends and the plates are then pressed in place. The top of the plate is welded and the bottom is spot-welded, after which the clamps are removed and the welding completed.

ELECTRIC WELDING IN CINCINNATI—OPERATORS AT WORK

ELECTRIC WELDING IN CINCINNATI—JOINT AFTER TEST

This new piece of track offered the first opportunity to obtain the exact average cost of welding joints. One pair of 32-in. plates with a 16-in. base plate was applied, at an average cost of $3.98. This included the cost of the plates, all labor, material and electric current sufficient to make a finished joint. This cost is for the channel plate construction. The average cost of welding a continuous joint was only 64½ cents, which, of course, does not include the cost of bolting the joint in place. It merely covers the cost of the laborer's time, welding steel, and the current used. The average cost of welding rail braces to the steel ties or to the tie plate was 6 cents, including labor and material used, but excluding the plates and braces. While we had but one fair day's run on this new welded track construction, one welder operator made ten complete straight plate joints and the other operator twenty continuous joints. With good conditions, it is believed one operator can easily weld from eighteen to twenty rail braces an hour.

At the recent convention of the Roadmasters' and Maintenance of Way Association of America the following officers were elected: President, P. J. McAndrews, of the Northwestern; first vice-president, Coleman King, of the Long Island; second vice-president, M. Burke, of the Chicago, Milwaukee & St. Paul; secretary and treasurer, L. C. Ryan, Northwestern. W. H. Kohmehl, Chicago, Milwaukee & St. Paul, and A. Grills, Grand Trunk, were elected to the executive committee. The next convention will be held in Chicago, beginning Tuesday, Sept. 14, 1915.

The Truss Rod Fallacy

L. B. STILLWELL, CONSULTING ENGINEERS
NEW YORK, Oct. 5, 1914.

To the Editors:

I have read with interest the editorial in your publication of Oct. 3 in regard to truss rods on steel cars. While it is conceivable that the application of truss rods to certain steel cars may be found necessary on account of possible errors in the original calculations of the proper strength of the structural members of the specific car in question, their application to new cars, as part of the design, will be recognized as futile, if a little study be given to the subject.

In the diagrammatic illustration of a car shown herewith the load is assumed to be carried by the girder formed by the belt rail, the side sheathing, the side sills, and such portion of the posts as acts to stiffen the side sheathing. For the purpose of ready reference, the main members under consideration are shown in heavy lines.

If the portion of the car between bolsters is considered alone, the belt rail will be found to be under a compression strain and the side sill under a tension strain. When cars are built of wood it is customary to use a truss rod under the side sill, as it is difficult to incorporate the required continuous heavy compression member at the belt rail. In this wooden structure, with a truss rod, the heavy continuous side sill becomes the compression member and the truss rod becomes the tension member. With steel construction, however, it is obviously practical to incorporate a continuous member at the belt rail of such ample section that the stress imposed will be within the maximum desired fiber stress.

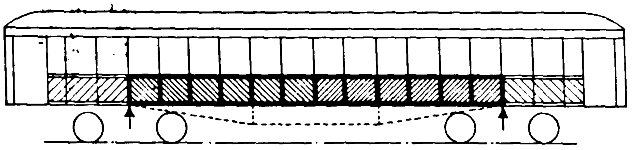

DIAGRAM SHOWING EFFECTIVE MEMBERS IN SIDE-GIRDER CONSTRUCTION

If a truss rod is applied under such a steel girder, both the sill and the truss rod can be in tension if the strain on the truss rod is carefully adjusted. It is obviously possible, however, to draw up the truss rod to such an extent as to reverse the stresses in the sill and the belt rail, producing then compression on the sill and tension at the belt rail.

Returning to the diagram of the car and considering the effects of the weight of the portion of the car body in advance of the trucks, it is observed that the stresses produced in the belt rail and in the side sill at the bolster are the reverse of those first above considered as occurring in the same members between the bolsters. In designing a car frame, the actual effect of this overhanging load must always be considered. In certain designs of cars for city service, having considerable overhang, the side sills may be altogether in compression, and in such cases the use of truss rods must be detrimental. In any case, the practical difficulty of tuning up a truss rod under a steel girder to the point necessary to cause the rod to carry only a definite proportion of the tension, is clearly apparent. Furthermore, the weight of material required for an adequate truss rod will be of greater structural value if incorporated in the proper girder members.

In conclusion, the application of a truss rod to the side girder of a steel car duplicates tension members. For this reason it will eventually create the same impression in the mind of an observer as would the application of a pair of shafts and a whip socket to an automobile.

F. M. BRINCKERHOFF.

BOSTON, MASS., Oct. 5, 1914.

To the Editors:

The "truss rod fallacy" pointed out in your last issue constitutes an interesting paradox. Frankly, it seemed to me hardly possible that the addition of metal to a structure could produce the astonishing result of weakening it instead of providing some little strength, especially when the addition consisted of such a well-known and widely used device as the truss rod. With that idea I developed a concrete case for an example, and judging by the result I have to admit that the truss rod should be relegated to a strategic position in the rear like that now occupied by the New York Giants. Under the circumstances it may be that the details of my example will interest your readers.

Assume an interurban car 60 ft. long and with truck centers of, say, 36 ft., giving an overhang of 12 ft. at each end. The framing between trucks would then have points of zero moment about 27 ft. apart. Assume the weight of body, with passenger load, to be 60,000 lb. and that the section between points of zero moment weighs, say, 27,000 lb., and also that 7000 lb. of equipment is distributed on the body framing between trucks, making the total load to produce moment equal 34,000 lb. Assume further that the side-girder type of construction is used and that the girder between sill and belt rail is 3 ft. high.

Then the load on the section of each side girder between points of zero moment (which constitutes a beam 27 ft. long) is half of the total, or 17,000 lb. Assuming that the neutral axis is midway between the upper and lower members of the girder, the moment in the center of each beam is, according to the well-known formula $\frac{Wl}{8}$, and each of the forces (tension and compression) in the sill and belt rail is (neglecting the web) approximately $\frac{Wl}{8h}$ where W equals the uniformly distributed load, l, the length, and h the height of beam. Substituting actual values, $F = \frac{Wl}{8h} = \frac{17{,}000 \times 27}{8 \times 3} = 19{,}000$ lb.

This is the amount of the compressive force in the upper member and also the amount of the tensile force in the lower member of the girder, and, if a truss rod is of any use, its installation ought to effect a decrease in both these tensile and compressive forces. Certainly it will not increase either one. Nor must it reverse the stresses to the extent that the original compressive stress is replaced by a tensile stress of greater amount or the original tensile stress is replaced by a compressive stress of greater amount. Obviously stress is stress, whether of compression or tension, because structural engineers use the same maximum figures for both, except that the safe compressive stress is reduced in the case of long columns.

Assume, then, that a truss rod is applied to the car in question without any change in the loading in any way. This truss rod assists the girder by introducing upward forces at the queen posts. To produce these forces, however, it must be set up so as to be strongly in tension, and this tension must have a reaction that appears as an equal compressive force in girder, or in other words, the pull from the truss rod tends to compress the beam longitudinally.

Owing to the presence of turnbuckles the ability of a car repairer with more beef than brains to set up the truss is limited only by the strength of the rod. Assume that the rod is 1¼ in. in diameter. Then the area is 1.227 sq. in., and if the elastic limit is 33,000 lb. per square inch the force which it can readily exert is 40,000 lb.

Now let us see what this force can do to the girder when the reaction appears in it as compression. If it is believed that the total force is divided about equally between the upper and lower members of the girder, each member will take 20,000 lb. of compression. Then, assuming that the moment remains unchanged, the original tension of 19,000 lb. in the lower member will be overcome and replaced by a compression of only 1000 lb. In the upper member, however, the original compression of 19,000 lb. will have added to it 20,000 lb., due to the reaction from the pull of the truss rod, so that the maximum stress becomes 39,000 lb., compression, instead of 19,000 before the truss rod was applied.

Now, for the sake of argument, assume that the moment at the center is reduced, by the action of the queen posts, exactly to zero. Then there will be a stress of 20,000 lb. compression, top and bottom, or 1000 lb. more than existed in each member before the truss rod was applied. Again, assume the moment fully reversed. Then the stress in the top member will be only 1000 lb. compression, but in the lower member the stress will go to 39,000 lb. compression. Therefore, in every case the presence of the truss rod, without a change in the load, has actually increased the maximum stress and thus weakened the beam.

In fact, it is impossible to conceive a set of circumstances (that are in accordance with the laws of nature and trigonometry) under which the stress will not be increased. Try a few other hypothetical cases. I did.

AMATEUR.

Insert Special Work Failures

TRANSIT DEVELOPMENT COMPANY

Brooklyn, N. Y., Oct. 2, 1914.

To the Editors:

I have noted with much interest the articles on the subject of insert special work failures in your issues of Sept. 19 and 26, and believe that the articles have served a good purpose in calling attention to the matter.

While I feel that the subject involves too much detail to discuss within the limits of a letter, there are a few points upon which comment may not be out of place. It appears that there are really three parties interested in the question, two of whom have been referred to, viz., the manufacturer and the engineer, the third being the purchasing agent. The first two cannot work together to the best advantage if the latter does not co-operate also. The reason for the failure of the purchasing department to co-operate at all times may possibly be due to the quite general lack of anything like standard specifications, which allows considerable latitude in bidding, with the result that the price often has a marked influence on the type of work ultimately purchased, disregarding, to a considerable extent, the type of construction the engineer has in mind for particular locations.

While it is doubtful whether it would be well to attempt to standardize every feature, there is little doubt but that the general dimensions of most castings and inserts, together with the character of the several metals in them, could be standardized with much benefit to all concerned, and it is therefore thought that the assignment of the subject of special work design and manufacture, for consideration by the committee on way matters of the American Electric Railway Engineering Association, would be productive of good results in this direction.

R. C. CRAM,
Assistant Engineer Way and Structure.

Tests of Automatic Train Speed Control

A public demonstration of the Horne & Crane train-control and train-stop device was held on Sept. 30 at the Cranford Junction yards of the Central Railroad of New Jersey. The tests were witnessed by a large number of engineers representing various railroad companies, signal manufacturers and the Interstate Commerce Commission. These tests were practised on a steam locomotive and were the first public application of this method of automatic train speed control by means of non-magnetic rail sections. Owing to the short stretch of track available the manganese track sections were spaced unusually near together in order to allow the locomotive a permissive speed of only 13 m.p.h. The tests, which proved successful in each case, were conducted to fulfil the three following situations: 1. Block approached occupied. Locomotive exceeded 13 m.p.h.; speed control and brakes were automatically applied. 2. Succeeding block still occupied. Locomotive reduced speed within 13 m.p.h. limit and no automatic brake application occurred. 3. Succeeding block clear. Locomotive passed speed control at fast and slow speeds without causing brake application to occur.

The object of this train-control and train-stop device is to provide a system of speed control which permits an oncoming train to approach the rear of a preceding train provided the speed of the train approaching is properly decreased as the distance separating the trains decreases. By means of the measured spacing of special sections in the running rail the speed of a train approaching an occupied block is automatically timed, and if its speed exceeds any predetermined limit at any point intervening between the distant signal and the home signal the train brakes are automatically applied under either service or emergency pressure until the train is stopped or until its speed is reduced to a certain predetermined rate of travel as may be desired by the railroad company.

The special sections inserted in the running rail are composed of ordinary manganese rolled-steel rail which is absolutely non-magnetic. Electromagnets are installed on the track in conjunction with the manganese control sections. The locomotive apparatus consists of a magnet suspended over the running rail which serves normally to maintain in closed circuit a valve connecting a timing cylinder with a source of compressed air supply. The piston of the timing cylinder times the movement of a contact disc controlling a brake pipe cut-out valve, which operation determines the speed of the train travel between manganese control sections when the block approached is occupied.

The bureau of mines of the Department of the Interior, has issued Bulletin 38 entitled "The Origin of Coal" by David White and Reinhardt Thiessen. The bulletin forms a report on an extensive investigation designed to show from microscopic examinations of coal, how far and in what ways the grouping of coal by types depends on differences in the kinds of plant material from which it was formed and on the conditions of its accumulation. The bulletin contains a chapter by Charles A. Davis on the formation of peat.

ASSOCIATION NEWS

MEETING OF WASHINGTON RAILWAY & ELECTRIC COMPANY SECTION

The first meeting of the Washington Railway & Electric Company section for the season was held on Sept. 28. The commercial department of the Potomac Electric Power Company met with the section. The principal feature was a paper by George C. Whitney, of the accounting department Washington Railway & Electric Company, entitled "The Accounting Department and Its Relations to the Other Departments." The paper provoked a lively discussion, after which informal addresses were made by Dr. Earle Wilsley and Dr. Abram Simon, ministers of local churches. In addition to felicitating the section upon the fine spirit manifested, the ministers gave summaries of recent experiences in Europe. Following the addresses, refreshments were served. E. S. Marlow, manager commercial department Potomac Electric Power Company, presided over the meeting, the minutes of which were forwarded to the ELECTRIC RAILWAY JOURNAL by B. F. Hunter, secretary of the section.

The purpose of Mr. Whitney's paper was to show how the work of the accounting department co-operates with other departments, and that its function is not to pile up a mass of unintelligible figures and reports to be filed away as records for possible future reference by the board of directors or the officers of the road. He showed by definite statements how the department can assist in improving the efficiency of the operation of the system. For example, the claim department can be furnished with facts and figures showing the causes of accidents and the facts bearing upon them, such as kinds of accidents, styles of cars, styles of brakes, service of trainmen, age of trainmen, mileage of cars, together with the cost of different kinds of accidents. Such data should enable the departments concerned to reduce accidents along certain lines. There is a close relation to the construction and maintenance departments also. The employees are apt not to associate the track gangs and their foremen with the accounting department which, however, plays an important part in figuring the cost of work and material and insuring their proper distribution. Many a dollar is lost through loitering on a job, ordering of surplus material and improper distribution of work. Similarly, the accounting department can call attention to economy in the ordering of supplies by the purchasing and stores departments.

In the work of the transportation department, the accounting department can assist by calling attention to statistics regarding accidents, and to the manner in which power is used by motormen. Through this department, the complaints of the power and substation operators to the effect that machinery is being overloaded, and that fuel cost is mounting up, can be brought to the attention of motormen. By giving figures of energy consumption per mile, or per car, on any given line and other data of this kind, the accounting department can help in reducing these costs. Again in the matter of making schedules, information can be furnished as to earnings, wages, hours, miles per line, which with the expression of these items in unit form, per car-mile, per car-hour, per passenger, per ton-mile, per seat-mile, etc., can indicate how schedules can be modified to produce greater economy. In the maintenance of buildings and equipment, the accounting department furnishes carhouse expense statements, comparative statements of operation and maintenance of substations and power plants, etc. These examples all go to show the importance of the accounting department in maintaining efficient operation of a property.

In the discussion of Mr. Whitney's paper, W. S. Ballenger, of the transportation department, stated that the instruction department drills the motormen carefully in regard to economical use of current, and the men have had careful instruction in regard to the coasting recording clocks. Special attention is called to the coasting averages by division notices. The transportation department also solicits suggestions tending to increase efficiency. The data sheets furnished by the accounting department are appreciated and are consulted when the question of increasing or reducing service is under consideration.

J. C. McLaughlin, of the commercial department, emphasized the importance of the accounting department's duty in furnishing accident data. He made a practical suggestion to the effect that a report bureau be established which would receive reports from all employees who notice defects on the property, these to be furnished on postal cards to be supplied by the bureau. George F. Mangan, of the commercial department, made the point that system is not enough in itself to produce results, and that the question in the use of any system is what use is made of the results. F. J. Mersheimer, of the claim department, urged that the accountants furnish simple statistics that can be understood and applied. L. L. Johnston, of the maintenance department, said that many of the foremen do not understand the importance of the data which they are called upon to furnish. If they did they would make a better showing for their work. A man who can do good work but cannot report properly upon it cannot expect to receive proper credit. V. A. Sisler, of the same department, mentioned some of the statements which are found especially useful, principally carhouse expense, operating expense, car accounts, job statements and manufacturing accounts. He stated that the accounting department is of great assistance to the mechanical department. W. F. Dement and C. P. King, president Washington Railway & Electric Company, also spoke.

DENVER TRAMWAY COMPANY SECTION

The September meeting of Company Section No. 3 was held in Denver on Sept. 17, 1914, with President W. M. Casey, trainmaster Denver City Tramway, in the chair. The attendance was 200. The paper of the evening was by A. F. VicRoy, superintendent Union Pacific Railroad, on the topic "Safety First on the Union Pacific Railroad." John A. Beeler, president Denver City Tramway, W. H. McAloney, superintendent of rolling stock of the same company, and others contributed to the discussion.

SECTION MEDAL COMPETITION

The committee on the section medal to be awarded by the American Association for the best paper read during the year before a company section will report on Wednesday afternoon, Oct. 14. The committee is considering the following papers: (Milwaukee section) "Purposes of a Street Railway Traffic Survey," by E. J. Archambault; "Pavements in Street Railway Track Zones," by V. W. Dentz; "Overhead Charges in Valuation," by H. G. Abendroth, and "Some Improvements in Car Design," by C. H. Cross. (Public Service section) "Maintaining the Way," by P. F. Maguire; "Training the Trainmen," by Charles H. Coe; "Some Elements Entering into Time-Table Development," by Alexander Jackson; "Inspecting the Rolling Stock," by John Hauf, and "Keeping the Company Department Store," by Robert S. Inglehart.

ENTERTAINMENT COMMITTEE ANNOUNCEMENT

Mme. Gertrude Auld, prima donna soprano of Milan, the soloist engaged for the officers' reception Monday night, though an American by birth is better known in Europe than in her own country. The foreign papers speak with enthusiasm of the quality of her voice and her great interpretative power. She made a most extraordinary success in Budapest and in Italy, where the Italians thought her singing was a return to the old school of Der Canto. Last winter she succeeded in calling forth enthusiasm of audiences in New York City with a recital on modern song.

PROPOSED INCREASE IN DUES

In the issue of the ELECTRIC RAILWAY JOURNAL for Oct. 3 an editorial commented on the proposed increase in company dues. The proposed and present schedules are as follows:

	Gross Receipts			Annual Dues	Present Dues
Under	$50,000			$25	$15
Between	50,000	and	$100,000	50	25
"	100,000	"	250,000	75	50
"	250,000	"	500,000	125	75
"	500,000	"	1,000,000	175	100
"	1,000,000	"	2,000,000	225	150
"	2,000,000	"	3,000,000	275	200
"	3,000,000	"	4,000,000	325	250
"	4,000,000	"	5,000,000	375	300
"	5,000,000	"	6,000,000	425	350
"	6,000,000	"	7,000,000	475	400
"	7,000,000	"	8,000,000	525	450
"	8,000,000	"	9,000,000	575	500
"	9,000,000	"	10,000,000	650	550
	10,000,000	"	over	750	600

South American Trip

After a two weeks' visit to New York manufacturers, H. N. Douthitt, special agent of the Department of Commerce, has returned to Washington for a short time before leaving for Rio de Janeiro, Brazil. This South American trip by Mr. Douthitt is taken at the personal suggestion of Secretary of Commerce Redfield, who thinks that a government representative will be able to obtain much information of value to American machinery manufacturers. Mr. Douthitt's investigations will be confined entirely to a study of the market in South America for general outside machinery and engineering supplies, including electrical machinery and apparatus. He will look into the matter of equipment for machine shops, but will not make any investigation of markets for textile machinery.

In talking with a representative of the ELECTRIC RAILWAY JOURNAL Mr. Douthitt said that he had lived for some time in Brazil, where he was interested in hydraulic engineering projects. As the result of this experience he concludes that American manufacturers should seek in South America a market based on the high quality of the goods produced. The quality is the best feature of American products, and this is thoroughly appreciated by South American buyers who have traded with our manufacturers. Mr. Douthitt spoke of two Westinghouse generators installed at Bellohorizonte, state of Minas Geras, Brazil, which had been cited all over the country as examples of the superiority of American machinery. They had been in operation about fifteen years, had worn out two sets of blades on the turbines, and when last heard of were as satisfactory as at the beginning. If all companies would do as certain of the large electric manufacturers have done and try, Mr. Douthitt said, to market products on the basis of high quality, they would secure satisfactory results.

While in South America Mr. Douthitt will call on the American consul in each city, with whom he will advise, and also make a personal canvass among the users of heavy machinery. He will obtain as thorough a description as possible of the machinery now in use, together with information concerning the source of manufacture, the cost and the present needs. Mr. Douthitt, with his knowledge of Portuguese, will discuss frankly the financial conditions in the various countries in order to find out whether buyers are in a position to pay cash, or, if not, what terms of credit they expect and what the countries can offer to American manufacturers in exchange for goods. The question now is not how much this country can sell to South American buyers but rather how much South American buyers will want to buy while financial conditions remain as they are.

Unless American manufacturers are prepared to have their representatives remain for a year in South America without showing a profit on sales, Mr. Douthitt does not advise the sending of representatives. If manufacturers desire to enter the South American market on this basis, however, they should secure their own representatives rather than try to do business through English and German commission houses, which already have extended connections with manufacturers in their own countries.

Electrical Openings in South America

Manufacturers of electrical machinery in New York, New Jersey and Pennsylvania have a remarkable field for development in South America, according to P. H. Burnett, industrial commissioner of the Lehigh Valley Railroad, in a bulletin recently sent out for the benefit of manufacturers along the line of the railroad. The latest census figures show that of the $221,000,000 of electrical machinery manufactured in the United States each year, $49,000,000 is produced in New York, $31,000,000 in Pennsylvania and $28,000,000 in New Jersey. The world is recognizing the value of American electrical machinery, for $27,000,000 of electrical goods were exported from the United States in the fiscal year 1913 as compared to $20,000,000 in 1912.

Mr. Burnett believes that South America affords an opportunity greatly to increase American export trade in electrical machinery, on account of three conditions, the absence of coal, the presence of plentiful supplies of water-power and the need of power to operate railways, mines and industrial plants. That the opportunity is being seized is evidenced by the fact that Brazil's importation of electrical manufactures amounted in 1912 to nearly $6,000,000 and Argentina's importation to about $4,500,000. Chile, which has special facilities for obtaining water-power, imported in the same year $2,500,000 of electrical machinery and apparatus, while the imports of other South American countries brought the total to nearly $20,000,000. Of the $4,500,000 of this class of manufactures imported into Argentina only about $130,000 was from the United States, but of Brazil's $6,000,000 of electrical imports about $2,500,000 was from the United States.

Mr. Burnett speaks particularly of the excellent opportunities in the state of Bahia, Brazil. The market there for waterwheels and turbines, electrical motors, cables, etc., is sure to be steady and growing. On the Pacific Coast the opening for the use of electrical machinery is very great. In Chile it may be expected that hydroelectric machinery will be in constant demand in view of the mountainous nature of the whole country and the numerous rivers. American machine makers will find strong competition but will probably have few better openings for future trade. A report from Venezuela emphasizes the fact that further industrial development will mean a demand for turbines and other hydroelectric machinery, and it would be well for electrical manufacturers to study the needs of this country.

Equipment and Its Maintenance

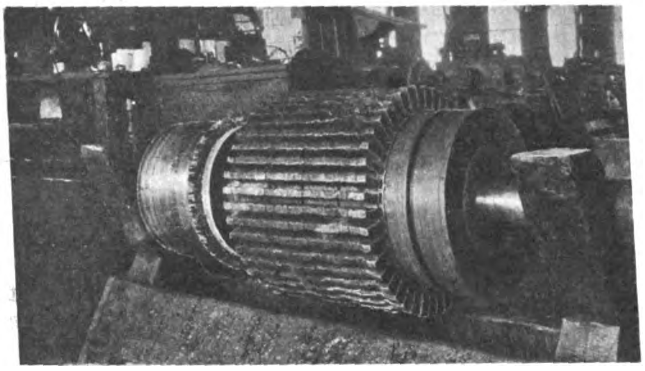
Short Descriptions of Labor, Mechanical and Electrical
Practices in Every Department of Electric Railroading

(Contributions from the Men in the Field Are Solicited and Will be Paid for at Special Rates.)

Welded End Laminations of Armatures

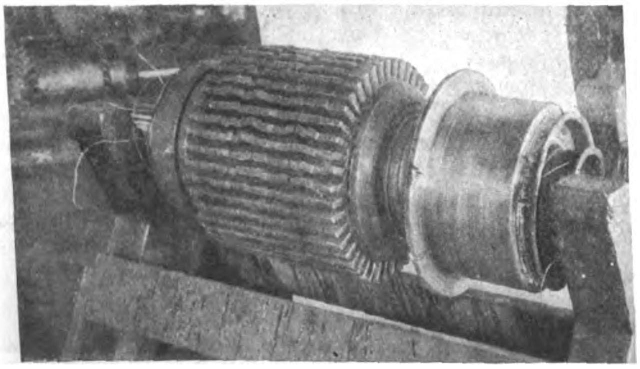
BY C. L. KELLER, ASSISTANT MASTER MECHANIC DETROIT UNITED RAILWAYS

In many of the earlier types of railway motors the laminations of the armature cores were supported and protected by the use of malleable-iron finger plates at each end of the core. These plates prevented any tendency of the core teeth to spread in the direction of the axis of the core. Later types of motors, however, are not provided with finger plates, but the support required at each end of the core is secured by making a few of the laminations of a heavier gage sheet metal than the remainder of the core.



VIEW SHOWING SEVERE TEST OF END LAMINATIONS WITHOUT CRUSHING

Our experience has demonstrated that this method of reinforcement offers a support far inferior to the old finger plates. Until a few months ago the core with flared or spread teeth was a constant annoyance. In some cases the core was made an inch longer because of this spreading effect. In this condition, perfect winding was impracticable since much pressure was necessary to force the coils into the slots, and this pressure often damaged the insulation so badly that some of the coils soon burned out.



VIEW OF ARMATURE SCARRED FOR ITS ENTIRE CIRCUMFERENCE

To prevent this trouble, a suggestion was made that the flaring teeth be pressed back in place and welded together. In this manner the end laminations would form practically a solid piece and furnish the same supporting effect as a finger plate. As an experiment, one core was welded in this manner, and the result was so successful that all spread cores are now being so treated. The process is quite simple, requiring merely that the core be set on end, in which position the laminations are welded, one tooth at a time, with an oxy-acetylene flame fed from our installation of this welding system. The welded section should have a thickness of from ½ in. to ⅝ in.

The accompanying illustrations give some idea of the remarkable strength of these welded ends. One of these cores was damaged by some object which had been carried into the air gap, with the result that a groove about ⅛ in. deep and ½ in. wide was torn around the entire circumference of the core. It will be seen that although the teeth were distorted the welded ends still remain as true and parallel as the day they were welded. The other illustration shows an armature core in which the end laminations have been subjected to a severe test without crushing. The actual cost of the welding is very small when compared to the cost of tearing down and reassembling a core, being about $7 for a core of forty-five slots. This figure includes some experimental work, and could, no doubt, be greatly reduced.

Vineville Avenue Concrete Paving, Macon, Ga.—The Cost

BY CARL H. FULLER, FORMERLY ENGINEER MAINTENANCE OF WAY MACON (GA.) BAILWAY & LIGHT COMPANY

The following is a detailed statement of the labor and material required to build 4290 ft. of track under the conditions described in my article of Oct. 3:

Labor		
Tearing up 4290 ft. of track at 3 cents per ft.		$128.70
Laying and surfacing:		
Fine grading, per foot	$0.02	
Placing ties	0.01	
Spiking and bolting	0.025	
Tamping	0.065	
Final surfacing	0.03	
Total, 4290 ft. at	0.15	$643.50
Policing and lighting		44.51
Hauling 1266 ties from stockyard, loading and unloading from service cars, 2-mile haul, at 4 cents each		51.43
Hauling rail from the stockyard, 76 tons at $0.345, or 160 bars at 10 cents each		26.21
Hauling away old material, miscellaneous hauling, cleaning up and labor not otherwise accounted for, 4290 ft. at 4 cents per ft.		51.56
Installing 266 bonds at 15.4 cents		40.97
Drilling and placing 400 ft. of guard rail, at 5½ cents per ft.		21.95
Total labor on 4290 ft. of track, at 23½ cents per ft.		$1,008.83
Material		
1266 No. 1 loblolly yellow pine ship pine ties, at 60 cents each		$759.60
260 bars 60-lb. A. S. C. E. rail, at $9.72 each ($33.25 per ton, or 59 cents per ft. of track)		2,527.30
400 ft. of guard rail at 53 1/3 cents per foot		213.33
Two pairs compromise joints at $6.70 each		13.40
260 pair 60-lb. angle bars at 58 cents per pair		150.80
266 9-in. concealed No. 0000 stranded bonds at 43 cents each		114.38
1100 nutlocks at 78 cents per 100		8.58
Eighteen kegs 7/16-in. x 5½-in. railroad spikes at $4.87 per keg		87.75
Six kegs track bolts at $4.90 per keg		30.91
Depreciation on tools		20.14
Lanterns and oil		10.64
Total material for 4290 ft. track at 91.7 cents per foot		$3936 83
Total labor and material, 4290 ft. at $1.15 1/3 per foot		4945.66

All rail was 33 ft. long and laid "broken joint" or "joint and center." Ties were placed two under each joint making a suspension joint, with four between, practically 3 ft. centers and requiring 1560 ties for the job. Of these ties, 294 found in the old track were considered sound enough to use again. As we have repeatedly uncovered ties incased in concrete from twelve to sixteen years and found them in fairly good condition we used no wood preserver, believing that because of the rigid monolithic construction of the pavement, which thoroughly incases the ties and rail in the cement, the ties would last as long as the paving itself. As the life of the paving could not exceed the average useful life of railway track, say twenty years, we did not consider it economy at this time to increase the initial cost of the work to obtain a result which would not be warranted by the life of the paving and the rail.

It will be noted in the tabulated costs that labor for laying and surfacing amounting to 15 cents per ft. is further subdivided into the various operations, but these subdivisions can only be considered relatively approximate as the transition from one operation to another is almost imperceptible. The rough grading and hauling away of excavated material by the city convict gangs, a service for which no charge is made against the job by the city, resulted in a saving to the traction company of 1324 yd. of original excavation which would have cost in the neighborhood of 15 cents per ft. of track.

The cost of installing 266 9-in. concealed, stranded No. 0000 bonds with compressed terminals under splice plates, the holes being drilled with a Duntley electric track drill and terminals compressed with a screw press (see article in July 25 issue of this journal) including replacement of two plates and four bolts tight ready for paving averaged 15.4 cents each for the job. On one day with everything in their favor the two men who operated this outfit placed thirty bonds in ten hours at a cost of $2.75, or 9 cents per bond.

The track laying gang averaged fourteen men and foreman. This work was done in forty-nine working days although the paving operations covered 103 days, including Sundays and delays. Track men received $2, $1.50, $1.35 and $1.25 a day of ten hours. No engineering or overhead is charged against the job.

The city paving gang did the actual paving. After one side of the street had been fine-graded for quite a distance, the 12 cu. ft. batch mixer was placed to control from 150 ft. to 200 ft. of paving and the material required was hauled in behind it. All sand was screened to remove foreign matter. Ordinarily, eight men were required to supply the mixer with material, two men to operate the mixer and six men to handle the concrete from mixer to grade, while three men tamped and raked it to grade, smoothing it first with long-handled spades and finishing with a long-handled wood float. There were usually about twenty-six men in the gang, the surplus being disposed as required. All were paid at the rate of $1.25 a day of ten hours.

The total actual area paved amounted to 11,957.8 sq. yd., having a cross section as shown in the sketch in the first article, being 8 in. on the sides and 11 in. thick from the bottom of the tie to the top of the rail in the track. In order to reduce our cost data to surface yard measurement we will change the extra 3 in. in the track to surface yards, which gives us a total of 15,306 sq. yd. The material for this cost appears at the bottom of the preceding column.

3775 bbl. of cement at $1.68, f.o.b. Macon or 0.42 bbl. per yd.	$0.42
Hauling from car to job at 8 cents per barrel in cloth sacks, sub-contract	0.02
1500 yd. of sand delivered on the job at 70 cents	0.07
3500 tons crushed granite, f.o.b. Macon, or 0.23 tons per surface yard, at $1.83 per ton	0.42
Hauling ⅝ mile from car to job at 40 cents	0.09
Material for 7500 ft. of expansion joint	0.02
Miscellaneous material, lumber, gasoline for mixer, etc.	0.01
Giving a total of $16,028.77, or per square yard of	$1.05

Reducing the foregoing figures to cubic yard costs we have 3400 yd. of concrete at $4.71 for material.

The labor to handle, mix and place this material cost in detail per surface yard as follows:

Superintendence (no engineering)	$0.026
Screening sand	0.006
Expansion joints	0.002
Fine grading	0.25
Loading and charging mixer	0.017
Operating mixer	0.009
Placing concrete	0.025
Finishing and surfacing	0.013
Miscellaneous labor, moving mixer, etc.	0.023
Making a total of $2259.65 or per sq. yd	$0.346

Reducing the foregoing figures to a cu. yd. basis we have 66 1/3 cents for labor. These figures give us a total cost of $5.37 per cu. yd. of concrete or $1.396 per surface yard in place.

The cost of this work was divided among the property holders, city and railway company as follows:

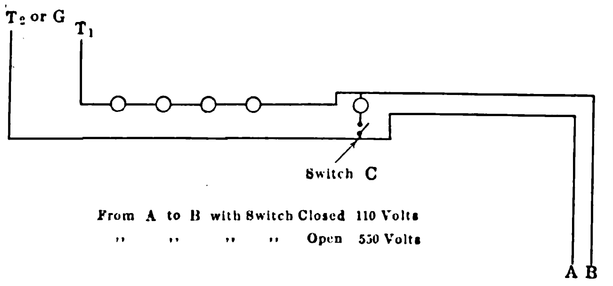
Macon Railway & Light Company, all inside of tracks and 1 ft. on the outside, or 4081.3 sq. yd., at $1.396	$5,694.49
Macon Railway & Light Company, 28 per cent. excess concrete in above	1,595.30
City one-third of remainder, or 2625.5 yd	3,665.21
Property holders two-thirds of remainder, or 5251 yd	7,330.42
Or, 11,957.8 sq. yd. of paving	$18,288.42
TOTAL COST FOR MACON RAILWAY & LIGHT COMPANY	
4081.3 yd. paving	$7,292.79
Labor and material for 4290 ft. of track	4,945.66
Total, 4290 ft. of track at $2.85 per lin. ft.	$12,238.45

The city engineer, Col. J. J. Gilliard, prepared the specifications for the paving while his office performed all engineering work required, and during construction the work was subject to his constant personal supervision. Dr. W. G. Lee, chairman of the aldermanic street committee, through his influence and energy made the job possible and also gave the work considerable detail attention. The writer as engineer of way for the railway gave personal supervision to the latter's part of the work and also kept detailed cost records for the job as a whole.

Standard Five-Light Series Cluster for D.C. Test Voltages

BY R. H. PARSONS, ELECTRICAL FOREMAN

A very convenient means for voltage tests is afforded by using a five-light cluster of the type found in most shops and carhouses where 550 volts d.c. is the standard.



WIRING FOR TEST WITH FIVE-LIGHT SERIES CLUSTER

The accompanying sketch shows how either 110 or 550 volts can be obtained by the use of such a cluster. Glancing at the sketch it will be seen that when the switch *C* is open there is no circuit for current, but that the difference of potential of 550 volts between *B* and *A* is available. Should this voltage break down the insulation under test, the circuit thereby created will cause the lighting of the lamps, allowing to pass through the break only as much current as would pass through the five lamps, namely, a little less than ½ amp. At the same time the voltage across *B* and *A* would be reduced to zero.

When switch *C* is closed a complete circuit is formed through the five lamps lighting all at the same time and giving a drop of 110 volts across *A* and *B;* or, to be more exact, the difference of potential would be approximately 100 volts, depending on the line voltage and the resistance of the lamps.

When using the test wires *A* and *B* with the switch closed the five lamps are lighted, and we have 110 volts for testing. Then in case of a breakdown of the insulation, or of placing the ends of these wires across a closed circuit, the lamp nearest the switch *C* will go out. Thus we would get through *AB* that current which would pass through four lamps in series, or a little more than ½ amp. A single-blade snap switch is used.

This plan is convenient for testing circuits at the bench, as on controller work, testing coils and commutators, etc. By using long leads it is also made available for pit work. To adapt a regular cluster for these purposes, remove one of the lamps and replace it with a plug and twin wire cord. Then run the cord to a suitable place over the bench or on the wall where the switch, another lamp, and the test leads can be installed. A convenient method would be to extend a bracket from the ceiling or wall adjacent to the bench and install the switch lamp and leads directly over the bench at a place easily reached by the workman.

Eliminating Crossed Grounding Currents in a Motor-Generator Set

BY J. G. KOPPEL, ELECTRICAL SUPERINTENDENT OF BRIDGES, SAULT STE. MARIE, ONT.

The following incident, which occurred during the equipment of a substation at Chambly Basin, Que., for the Montreal & Southern Counties Railway, may be of special interest to those who are connected with such installations. This station was designed to run in parallel with another substation at Ste. Lambert, about 12 miles distant. Energy is received at 25,000 volts three phase, sixty cycles, and transformed through one set of three 185-kva single-phase oil-insulated, self-cooled transformers, with 2300-volt delta-connected secondaries. At the latter voltage energy is delivered to a 600-hp polyphase slip-ring induction motor with stationary primary and revolving secondary, while the d.c. end of the set is a 400-kw commutating-pole, compound wound 600-volt generator.

When everything had been completed to the point of cutting in the current and starting up the machine, a ground wire was connected to the motor-generator frame as a precaution against possible danger, particularly when starting the machine for the first time. As soon as the oil switch was operated to cut the current in the motor a strong flash was visible between the grids in one of the three groups of starting resistance mounted over the starting panel. The oil switch was opened immediately thereafter, but the appearance of the resistance grids failed to indicate that anything was wrong. The manufacturer's representative then asked us to remove the ground wire from the motor-generator frame. The current was then cut in again, and the motor-generator ran all right.

Following a satisfactory test run the motor-generator was placed in regular service, but after operating for two weeks the bearings started to run hot. On starting up the machine one dark morning a long spark was seen to follow the oil rings in the bearings, and when the end cups were removed from the bearing ends a spark was visible around the armature shaft in the bearing ends. The machine was then shut down and the bearings taken apart. It was found that the shaft had been badly roughened while big holes had been burned in the bearing babbitt. A careful investigation disclosed that a ground in one of the resistance grids, namely, at *X* in the accompanying diagram, was responsible for the burns in the shaft and bearing.

The trouble arose as follows: On starting up the machine a certain amount of current would flow to ground from the motor armature, which was star-wound with grounded neutral, and, since the resistance also was grounded, currents of different character and phase were set up in opposite directions. The discharge between these two currents was through the oil film in the bearings. Not only did this arc break down the oil film, but it also burned the bearing and armature shaft enough to cause hot bearings.

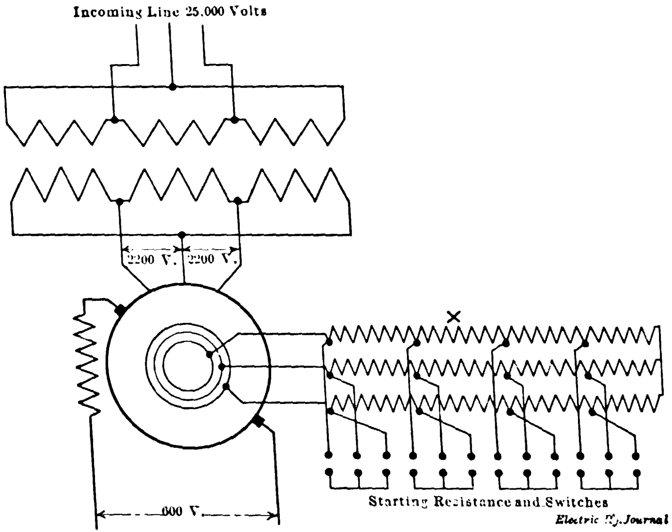


DIAGRAM OF MOTOR-GENERATOR SET, SHOWING LOCATION OF GROUNDING POINT IN STARTING RESISTANCE

To correct the trouble the bearings were scraped, the shaft was polished with carborundum, the oil was replaced with fresh liquid, the ground was removed from the resistance and the motor-generator frame was earthed with a good grounding wire. Finally, we placed in the rotor a grounding brush in a medium-sized brush-holder. This holder was so mounted on the motor-generator frame that the carbon brush could make a sliding contact with the rotating armature shaft. Since these changes were made the motor-generator has run without any arcing or hot bearings.

British Ideas on Cab Signals

The British Board of Trade report upon accidents on railways in the United Kingdom during 1913 draws special attention to the use of electricity in preference to gas in railway carriages, and also to the necessity of adopting means to safeguard against mistakes by signalmen and locomotive engineers. Regarding the latter, a memorandum was prepared towards the end of last year by the inspecting officers and submitted to the various railway companies urging them to extend the use of electric track circuits in connection with the control of signals, and to carry out combined experiments with different systems of cab signaling and automatic control with the object of supplementing the present system of semaphore signaling.

A Complete Progress Profile Used by an Iowa Interurban

The Waterloo, Cedar Falls & Northern Railway, Waterloo, Iowa, is just completing a 60-mile extension to its lines between Waterloo and Cedar Rapids. In connection with this construction work a complete progress profile was desirable to give the management a diagrammatic record of the work done each week. To meet this requirement a complete form of progress profile has been devised by T. E. Rust, chief engineer of this road.

This profile is shown in the accompanying illustration, and is standard correspondence paper size. In it the entire road is covered by a series of sheets, each including about 6 miles of line. It will be observed that besides containing the usual profile and grade line with a color key for each month's grading, space is provided for actual pay quantities per week, per month and the total. In addition to the concrete openings there are included timber bridges, track laying, ballast overhead lines and an alignment map. Each of these designations is colored by the different resident engineers, in accordance with the progress made on the division in their charge and sent to the chief engineer's office regularly each week.

The record sheet is about 9 3-4 in. wide by 8¼ in. high, with a 1-in. margin at the left for convenience in binding.

An Effective Fire-Bucket Rack at East St. Louis

An inexpensive and convenient fire-bucket rack has been designed and built by the mechanical department of the East St. Louis & Suburban Railway. It has been standard practice for this company to provide wooden shelves for this purpose throughout its shops and carhouses. In many instances the location of these shelves was such as to form a convenient shopmen's catch-all. In order to make it impossible to utilize these racks for storage shelves, the strap-iron racks shown in the accompanying illustrations were made for two 14-qt. buckets, at a cost of approximately 76 cents each. They are made of forged strap iron riveted together.

PROGRESS PROFILE, INCLUDING DESIGNATIONS FOR CONCRETE WORK, WATERLOO, CEDAR FALLS & NORTHERN RAILWAY

Welding Plant of Omaha Street Railway

The car shops of the Omaha & Council Bluffs Street Railway, which care for the maintenance on 420 cars and which have built twenty-five double-truck cars during the present year, are obtaining excellent results from the use of an oxy-acetylene welding plant. This has been operated about a year. T. J. Woods, master mechanic, points out that so many new uses for the welding outfit have been found that it is kept in operation nearly all the time.

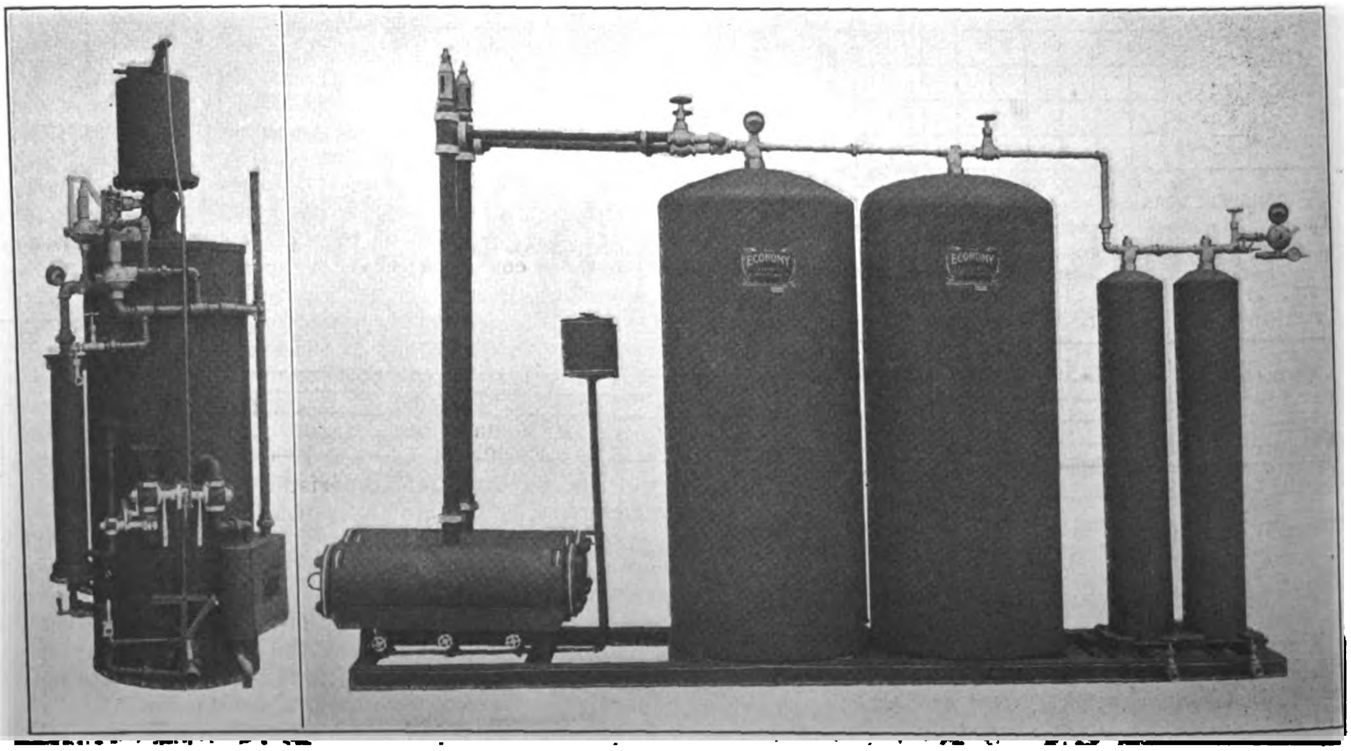
This plant is of the generator type and was manufactured and installed by the Economy Welding Machine Company, Kansas City, Mo. It consists of two oxygen retorts and an automatic acetylene generator, together with scrubbing and storage tanks, regulators, piping and blowpipes. The generating plant is installed in a sheet-steel building 7 ft. x 10 ft. in plan located just outside the erecting shops. The exterior of the building has been sheathed with wood, and electric heaters have been installed to provide against freezing.

From the generating apparatus oxygen and acetylene pipes lead to the wheel shop and to the machine shop, where provision is made for attaching cutting or welding blowpipes. A special welding table is used in the machine shop. This has a brick floor and on it are built brick ovens for use when preheating is necessary to protect against cracks from uneven temperature.

The first welding done was on pieces taken from the scrap heap. Fifty malleable-iron gear cases were reclaimed at small cost. They were patched or the cracks were filled in and the cases were made serviceable by using Tobin bronze as a welding material. This alloy is readily handled in the oxy-acetylene flame and it unites firmly to malleable iron parts. Tobin bronze is put to a great many uses on malleable iron parts where straight welding would be more difficult. For example, it is used to build up wearing surfaces in such malleable iron castings as brake-hanger brackets.

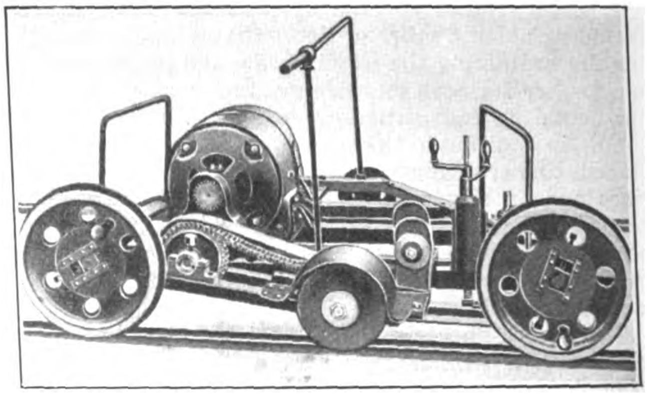
In addition to the kind of work just mentioned this oxy-acetylene blowpipe is used for many construction and repair purposes in this shop, and when fed from portable cylinders has been used for heavy machine repairs at the power station.

The oxy-acetylcne welding is done by a blacksmith who became proficient after short instruction and practice.



ACETYLENE GENERATOR, OXYGEN RETORTS AND ACCESSORIES USED BY OMAHA & COUNCIL BLUFFS RAILWAY

Performances of Portable Rail Grinder



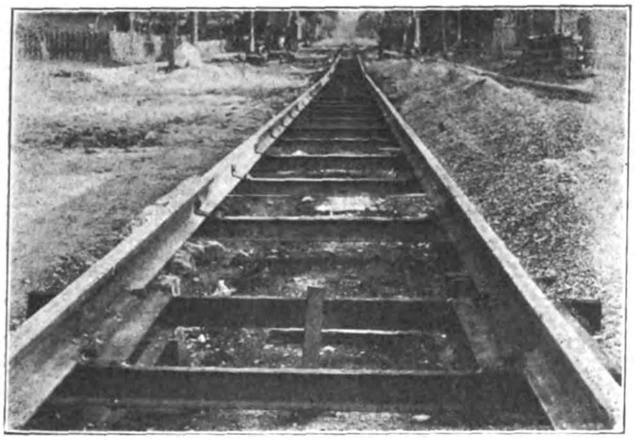
PORTABLE RAIL GRINDER WITH SILENT CHAIN DRIVE

The accompanying halftone shows the standard form of portable electric rail grinder built by E. P. Seymour, Waltham, Mass. Several of these machines are now in use on a prominent electric railway of New England. This grinder can be operated on switches, mates, frogs, curves or tangent track, and, in general, is adjustable to all conditions of grinding. It is driven through a silent chain by means of a 3-hp, 550-volt d. c. motor, geared for 2500 r.p.m. The maker states that with this grinder joint depressions averaging 3/16 in. in depth were removed in twenty minutes by grinding 24 in. on each side of joint. Again in repairing battered joints with an electric arc welder, where forty-eight joints with an average depression of 1/8 in. were built up with the electric welder for 12 in. in length and 1/8 in. above the true surface of rail, the average grinding cost per joint was only 37 cents with this machine, as against 70 cents for two other grinders. One of these machines also ground a manganese centered frog after the battered depression had been built up with the electric arc welder. The surplus steel, which was 12 in. in length and 3/16 in. above the true surface of the rail, was removed in fifteen minutes, leaving the frog practically as good as new. Rail corrugations have also been removed by this grinder at an average cost of 20 cents per lineal foot for corrugations of 1/16 in.

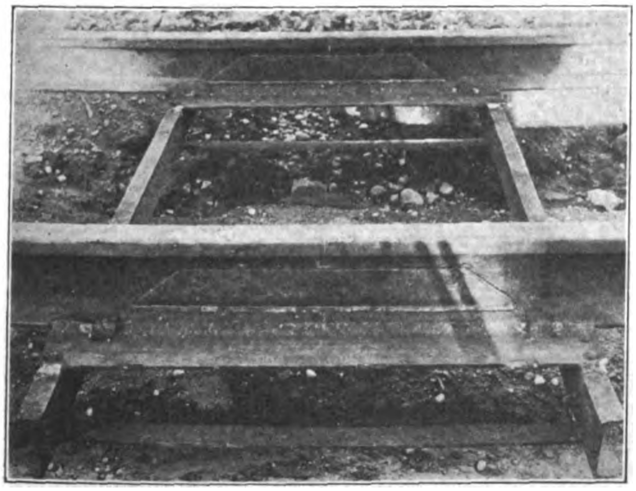
While the weight of this machine is 800 lb., its construction is such that it can be quickly and easily removed from place to place on the rail. The total time required for moving the machine on and off track is about one minute, and it has therefore been found entirely practicable to use it in locations where cars pass every ten minutes.

American Railways All-Steel Track on Concrete

A recent development in permanent track construction is that employed by the American Railways Company. Essentially this construction includes 100-lb. A.R.A. standard T-rail in 60-ft. lengths, mounted on Carnegie steel ties, to which it is fastened by brace slips. The joints are supported on International steel ties. This track structure in turn is supported on a concrete foundation, the concrete being carried continuous from the bottom of a prepared trench to the sand cushion under the granite block pavement. The granite block, however, is used only in the track allowance, that adjoining it being sheet asphaltum.



VIEW OF WELDED JOINT AND STEEL TIE CONSTRUCTION



SIDE VIEW OF WELDED JOINT AND STEEL TIE CONSTRUCTION

In an endeavor to obtain a construction which would give maximum service, it was believed that not only a permanent type of foundation and track should be employed but also that joints should be eliminated as far as possible. To this end this company adopted Indianapolis "Simplex" welded joints, which also serve as bonds while providing greater strength and conductivity than do bonds with mechanical joints. As shown in an accompanying illustration, the base of the rail is also welded to the bearing plate of the International tie, while the joint is welded to the base and web of the rail. This welding was done by the metal electrode process with current from the trolley line. Only one man was required to operate the welder. The energy consumed for welding on the two joint plates, welding the bases of the rails on each side of the tie bearing plate and for welding the tie members cost approximately 40 cents per joint. This cost, including the cost of the joint plate, is, therefore, less than bolted and bonded joints. In other words, a permanent construction was obtained at a low initial cost.

Non-Corrosive Heater Wire

The Consolidated Car-Heating Company announces that it has developed and adopted as standard a non-corrosive heater wire for the resistance coils on all of its electric heaters. The trade name given to this new wire is "Nokoro." The development of this wire marks an important advance in electric heater practice inasmuch as its use will prolong the life of the heater under normal conditions of service almost indefinitely.

When electric car heating came into general use several years ago the so-called alloy resistance wires then available were hardly suited for heater resistance coils because they were of nickel-steel composition, which rendered them particularly susceptible to corrosion, or else of such high resistance that it was necessary to use a wire of such large cross-section that the best construction of coil for effective radiation could not be employed. For many years a special grade of galvanized iron wire was used for the heater coils with very satisfactory results. In fact there are many heater equipments which have been in continuous service for from ten to fifteen years and which are still equipped with the original coils. Tests of some of these equipments have shown that the original characteristics of the coil have in no way altered during this time. The iron coils depended, of course, on the quality of the iron for accuracy of resistance, and on the galvanized coating to prevent corrosion. Under certain conditions where the galvanized coating was scraped or flaked off in the coil winding machines, where the coils were run at too high a temperature or where the climate was exceedingly moist, the iron coils would show tendencies toward corrosion. It is to overcome troubles arising from these conditions that the "Nokoro" wire is to be used.

The development of low-resistance wires, particularly those of the copper-nickel group, has shown wonderful progress in the past few years. In determining the alloy best adapted for use in heater coils extensive tests have been made by the company with heaters for 600-volt and for 1200 and 1800-volt service. The following characteristics were kept in view in determining the best alloy obtainable:

A wire of relatively low resistance, thereby permitting a considerable length of wire to be used, in gages of from Nos. 16 to 20, with which the best conditions for radiation of the heat, ventilation of the supporting spindle and low temperature of the coil can be obtained.

A wire of high melting point so that the coil will not be destroyed in case of accidental overloading.

A uniform resistance and heat coefficient so that the coils will be entirely accurate.

Genuinely non-corrosive qualities.

The new wire is said to combine all of these desirable characteristics, and in addition it is of such a composition that it can be used in coils which are for repairs in series with iron resistance coils in all heaters without affecting the heating capacity for which the equipments were originally planned. It also is a wire which in the spool form is of dead soft temper but which is brought to a marked spring temper in going through the coil forming process. The result is that the coil binds firmly to the porcelain supporting spindle, rendering the coil free from vibration and from sagging. The forming of the coils is accomplished on ingenious coil-winding machines and the predetermined resistance of the coils is accurately measured and the coil automatically cut off by special magnetic relay cut-off machines which the company has developed.

New Trailer Connector

A 75-amp trailer connector as shown in the accompanying illustration has just been placed on the market by the Electric Service Supplies Company. Its design is identical to that of the standard 10-amp type originated by this company about five years ago. The new type has been brought out to meet the demand for a connector with sufficient capacity to supply current for both lights and heaters in the trailer.

TRAIL CONNECTOR

All the safety features of the 10-amp connector are also embodied in the one of greater capacity. When the connectors are not in use the exposed metal parts are automatically disconnected, thus absolutely eliminating possible danger of shock to employees and passengers. The shells are of hard maple thoroughly impregnated with insulating material and waterproofed to avoid the breakage which often occurs when hard rubber compositions are used. The connecting tongues are of heavy brass equipped with phosphor-bronze retaining springs. Sockets for holding the connectors when they are not in service are of either the same material as the shells of the connectors or of cast iron, black enameled. In the cast-iron socket no further insulation is necessary owing to the automatic disconnecting feature of all exposed parts in this type of trailer connector. In general, the development of this fitting is another proof of the increased attention which is now being given toward making trail car equipment modern in every particular.

Germiston (Transvaal), South Africa, has recently inaugurated a railless traction system. The Cedes-Stoll system is used, the special feature being a flexible trolley which is kept automatically taut. The power is delivered from a substation containing two Peebles motor-converters, the a.c. supply being furnished by the Victoria Falls & Transvaal Power Company.

Emergency Valve for Straight Air-Brake Equipments

A new emergency valve, designated type E form J, has recently been developed by the General Electric Company. This valve can be furnished with all new straight air-brake equipments or added to existing equipments. The use of the device not only increases greatly the safety factor of the straight air brake on city cars, but also provides a means for operating safely two-car trains during rush hours.

Brakes can be applied more quickly when the motorman's valve handle is placed in the emergency position, for the emergency valve then operates and admits main reservoir air direct to the brake cylinder without passing through the motorman's valve. An emergency application of the brakes can also be made by the conductor from the rear platform, or from any part of the car or train, by opening the conductor's valve, which vents the emergency line pressure to the atmosphere. An automatic application of the brakes is thus made should a rupture occur in any part of the emergency line. This assures maximum braking power if the pipe connections at the ends of the car are accidently broken. Likewise the brakes are automatically applied in the event of cars pulling apart while operating in trains.

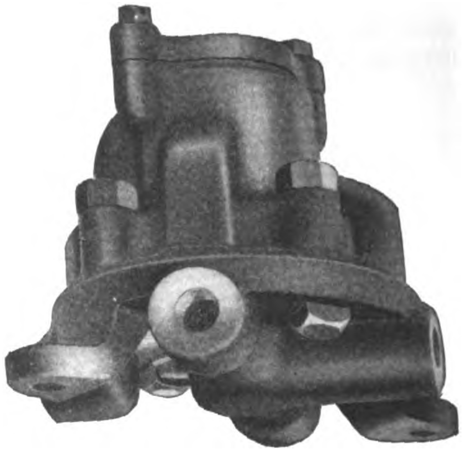


FIG. 1—EMERGENCY VALVE

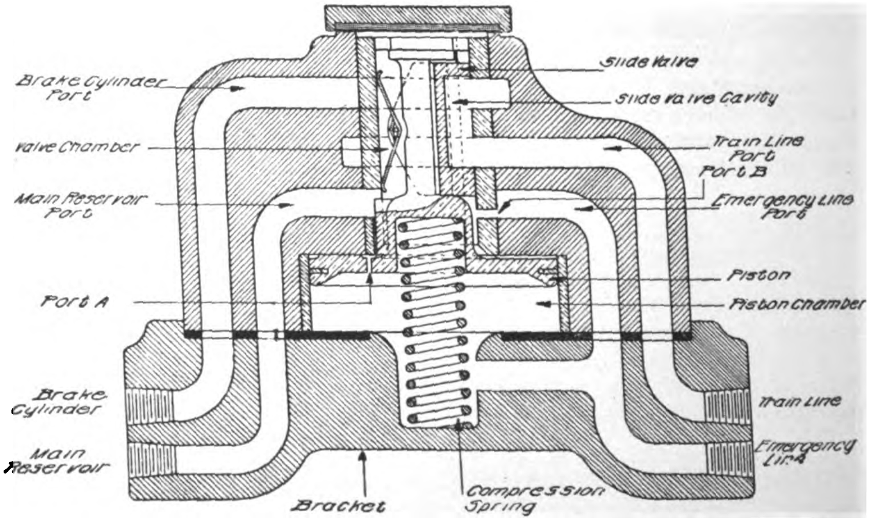

FIG. 2—DIAGRAM OF EMERGENCY VALVE IN NORMAL POSITION

The emergency valve is of the pipeless type and of very simple construction. The working parts consist of a piston, slide valve and compression spring. Pipe connections to the main reservoir, emergency line, train line and brake cylinder enter the bracket or head to which the valve body is bolted.

Figs. 2 and 3 are diagrams, not actual sections, indicating the operation. In the normal position of the emergency valve, Fig. 2, the train line and brake cylinder are connected through the slide valve cavity. The main reservoir and emergency line are connected through the restricted port *B* drilled in the slide valve seat. When a service application of the brakes is made air flows from the main reservoir to the valve chamber through port *B* to the emergency line, thence through the motorman's valve, the train line, slide valve cavity and brake cylinder port to the brake cylinder.

When the brakes are set through an emergency application in any of the several ways described, pressure in the emergency line is suddenly reduced, unbalancing the pressure on the emergency valve piston, which causes it to move, as shown in Fig. 3, to the emergency position. Communication between the train line and brake cylinder is then cut off and established between the main reservoir and brake cylinder.

After an emergency application has been made, the brakes may be released by closing the opening in the emergency line. Main reservoir air will then flow to the emergency line through the restricted port *A* drilled in the piston, charging the latter to the main reservoir pressure and allowing the compression spring to return the piston and slide valve to normal position. Brake cylinder air can then be exhausted by placing the motorman's valve handle in the release position.

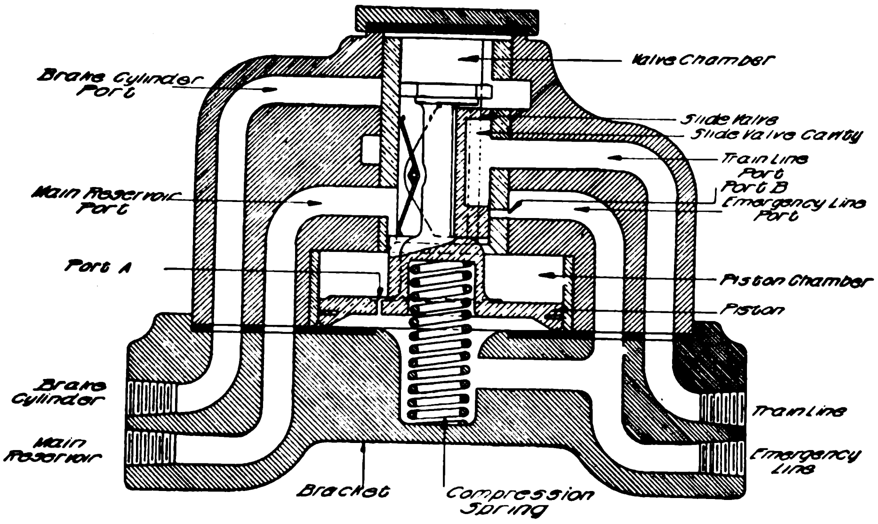

FIG. 3—DIAGRAM OF EMERGENCY VALVE IN EMERGENCY POSITION

Molded Insulation Cover for Connectors

There has been a great demand for a connector with an insulated cover for use without solder for the small sizes of wires. Heretofore this demand has been largely met by the Special No. 1 connector of Dossert & Company, New York, but as this connector was designed to take all sizes of wires and cable from No. 1 to No. 14, the range was believed to be wider than necessary. The manufacturers now announce the production of a molded insulation cover for use on the regular No. 4 connector. This connector will take all sizes of wire from No. 4 to No. 14. Many thousands are in use for transformers, motors, meters, sectionalizing cases for signal apparatus and other connections where it is desired to use a connector without solder, one that may be disconnected when desired but which when in place provides a joint of high conductivity, speed and safety.

By making the insulating cover for the regular No. 4 connector, the fitting is reduced in size and material. There is also a reduction of about 20 per cent in cost to users as compared with the cost of the connector and cover heretofore supplied for small sizes of wire. With these connectors various size bushings are provided, the outside diameters of which fit the connector while the inside diameters correspond to the size of wire that it is desired to connect.

MOLDED INSULATION COVER FOR CONNECTOR

A Full Day's Work for Extra Men

The Portland (Ore.) Railway, Light & Power Company, of which F. W. Hild is general manager and Fred Cooper is superintendent of transportation, has found it practicable to employ nearly all the extra platform men for a full day by assigning them to other work between rush-hour periods. Before the plan was tried out some doubt was felt as to how the proposition would appeal to the men, but it has been found that the extra runs are now not infrequently chosen by regular men. In other words, a day made up of platform service during rush-hour periods and manual labor in between is preferred by some of the regular platform men. The lower wage rate paid for the hours devoted to manual labor seems to be compensated for by the advantages of leaving evenings free. Between rush hours the company is now assigning about fifty-five platform men to regular duties in washing or sweeping cars, doing other light work in the carhouses, or delivering bills for the lighting department. The company now delivers all bills by messenger at a saving of 50 per cent of the mailing cost, besides gaining the advantage of including as much advertising literature with the bill as may be desired.

Steady employment for the extra list is particularly desirable on this company's system, because the traffic in Portland has two daily peak loads, morning and evening, which are usually high and sharp for the amount of traffic carried during the middle of the day. Thus it has formerly been necessary to maintain a large extra list, and some of these men were needed only for very short periods twice a day. Their earnings did not amount to a living wage and they had to find means of supplementing the income from this source or seek other employment. Wages paid platform men vary from 25 cents to 31 cents per hour, according to length of service. Extra men are taken on at the lower rate and are employed with the understanding that whenever not needed on the platform they will be assigned to duties in the depots or distributing bills at the rate of 22½ cents per hour. Thus they regularly put in a full day and have their evenings free.

The Brockton & Plymouth Railway and the Bay State Street Railway recently carried two carloads of live cattle. This is the first shipment of live cattle over these roads.

News of Electric Railways

WORKING OUT KANSAS CITY DETAILS

A Résumé Is Presented of the Steps Being Taken Toward Complying with the New Kansas City Franchise

The many bodies which through court action or by municipal enactment have been made parties to the reorganization of the street railway in Kansas City are working out the many problems that confront the company, the city, the court and the new company. Under the terms of the franchise the Kansas City Railways, the successor company to the Metropolitan Street Railway, can have no ownership or control of the street railway system until the terms of the contract as to mortgages are complied with. These terms prescribe that all the many mortgages shall be liquidated and the property turned over unincumbered except for one new instrument, approved by the city. When the new company finally does take charge, the contract will be as of date of July 7, 1914. This made it expedient, therefore, that the books from July 7, 1914, should be possible of continuance without interruption after the new company was finally given formal ownership. This consideration is one of many which brought about the following apparently rather involved, but in fact very simple, inter-relation between the old and the new companies, the city and the court officers.

The court is the head of the street railway organization in Kansas City. Acting under the orders of the court are Robert J. Dunham and Ford F. Harvey, receivers of the Metropolitan Street Railway, who from the beginning have operated the street railway system through the officers who had previously been in charge of the Metropolitan Street Railway, including John M. Egan, president, and James E. Gibson, general superintendent. When the new franchise was granted by the people of Kansas City there could be no immediate assumption of authority by persons and officials mentioned in the franchise as being the managers and operators of the system under this instrument. All concerned felt it advisable, however, that the persons and officials mentioned in the franchise should at once get in touch with the work that was finally to devolve upon them. The matter of a uniform set of books from the nominal beginning of the contract on July 7 also entered into the consideration. Therefore, when the Kansas City Railways, the recipient of the franchise, held its first election, it named as officers the two men who were operating the Metropolitan Street Railway as receivers and who would continue to operate it as receivers, regardless of the officials nominally at the head of the company. Robert J. Dunham was elected president of the Kansas City Railways, Ford F. Harvey was elected vice-president of the company; E. E. Ball, connected with the office of Frank Hagerman, was elected secretary and treasurer, and Mr. Hagerman and Clyde Taylor, attorneys for the receivers and for the Metropolitan Street Railway, were elected to the board of directors.

The officers of the Kansas City Railways, being the receivers of the Metropolitan Street Railway, naturally would be best able to work out harmoniously the problems of both companies. The most delicate situation that would have confronted separate groups of officers was in respect to the board of control, which the franchise declared should have large authority over the operation of the system after the contract became finally effective. In order that the franchise requirements might be met most expeditiously P. J. Kealy was named a member of the board of control for the company, and R. P. Woods was named for the city, and they were "put to work" at once for the receivers, investigating and solving the problems that would later confront a board of control and informally, but none the less effectively, assisting the receivers in installing the methods and ways which they at a later date will use officially. The board of control has its reason for temporarily acting at this particular stage, through assignment to specific duties under the receivers. The board of control as an agent of the receivers, is going right ahead with the work that the franchise imposes on it, such as arranging car routings, overseeing the character of the equipment, etc., and is also completing its reinventories as the basis of adjusting the differences in the Arnold-Ash estimates, for use in connection with future capital charges.

The rearrangement of the financing of the lines in Kansas City under the title of the Kansas City Railways must be completed by February unless there is reasonable excuse for delay on the part of the company. The many merely technical details of the franchise are gradually being complied with, and the operation of the system is proceeding very much as though the affairs had already been straightened out.

BOYLSTON STREET SUBWAY OPENED AT BOSTON

Tunnel Contains 3 Miles of Single Track and Was Built in About Two Years—Cost $4,500,000

The Boylston Street subway was opened for traffic by the Boston Elevated Railway on Oct. 3. On the preceding day about 300 invited guests made the trip from Kenmore Street to Park Street by special cars, the party including members of the Boston Transit Commission, various state officials, municipal department heads, and officers of the company headed by President Bancroft. The general relation of the subway to the Boston surface line and rapid transit system has already been outlined in these columns. The subway has been built in about two and one-half years by the Boston Transit Commission and its contractors. It is a double-tracked tunnel throughout and contains 15,870 ft. of single track. The total cost, including property taken for construction, was about $4,500,000.

The subway differs from the Tremont Street tube in many particulars, the most important being the operation of a single type of cars on its tracks. Only the company's latest type of semi-convertible steel car with four-motor equipments geared for a maximum speed of approximately 35 m.p.h. is used, and from the junction with the Public Garden incline tracks beneath Charles Street to the westerly end of the subway at the Kenmore Street incline, the movement of all cars is governed by automatic block signals, forty-three blocks of the Union Switch & Signal Company's make being installed. The signals are placed to permit the operation of cars on a minimum headway of thirty seconds. At the stations at Copley Square and at Massachusetts Avenue two berths are provided on each track. The platforms are each 350 ft. long, and as only two cars are permitted to occupy an inbound or outbound track at a station at any one time, ample track space is available to permit quick acceleration and deceleration. It is planned to operate trailers when the growth of traffic necessitates it. The block signals are of the three bull's-eye type, giving a yellow distant indication in addition to the usual proceed and stop lights. On the opening day the normal-hour service was maintained on a two-minute interval in each direction and this was increased to forty-five cars an hour in the rush period. In this connection it should be noted that the Park and Boylston Street stations are in the Tremont Street subway, a short section of which is traversed by Boylston Street subway cars. The service during the rush hour period in the new subway is maintained on schedule time, with little or no reduction in speed. The subway saves about seven minutes in normal hours to through passengers and from ten to twelve minutes in rush hours.

In addition to the service changes previously mentioned in relation to the new subway, the company has scheduled all Harvard Square-Viaduct cars formerly running through the Tremont Street subway to Pleasant Street to a new terminus at Copley Square, where a loop has been provided. This arrangement contributes to frequent service over the surface to and from the downtown district. The Newton Highlands line of the Middlesex & Boston Street Railway will hereafter terminate at Lake Street, there connecting with inbound cars, and the Auburndale-Park Street service has been transferred to Beacon Street, relieving outer Commonwealth Avenue of comparatively small and slow rolling stock units.

The track is of 85-lb. A.S.C.E. 5-section laid in broken stone ballast. At stations the roadbed is grouted with concrete poured flush with the tops of the ties, platforms and roadbed being drained to enable the entire station to be washed down with hose. The platform edges are flush with the top of the rail, and a ramp 16 in. wide, of carborundum to prevent slipping, borders the rail. A light-colored safety strip 6 in. wide is also provided. The maximum grade is on the Kenmore Street incline, 5 per cent, and 32 per cent of the trackage is curved, the radii varying from 400 to 5000 ft., the total deflection being 152 degrees. The maximum depth below the surface is 39 ft. As in other lately built subways at Boston fireproof material has been used throughout, and wooden slabs have been provided on top of concrete seats at stations. Seventy per cent of the subway volume lies below ground water level. The interior lighting is by 23-watt tungsten lamps wired in series circuits of ten each. Motor-driven International fare boxes are used at stations.

TRANSIT CONSTRUCTION PROGRESS IN NEW YORK

Some 17,000 Men Engaged in Construction—Fifty-nine Contract Sections Let, Aggregating $140,516,385

According to the progress reports for September made by the division engineers to Alfred Craven, chief engineer of the Public Service Commission for the First District of New York, there are now about 17,000 men engaged in construction work on the dual system subway and elevated railroad contracts. Of this total about 14,000 are employed by contractors building the lines to be owned by the city and about 3000 by contractors building the elevated extensions and additions to be owned by the companies. The dual system is divided by the commission into eighty-three contract sections. Contracts have been awarded for fifty-nine of these sections, leaving only twenty-four yet to be made. Of those already awarded thirty-one are on lines to be operated by the Interborough Rapid Transit Company and twenty-eight on lines to be operated by the New York Municipal Railway Corporation. Of those remaining to be let, eight are on Interborough lines and sixteen on New York Municipal lines, the latter including six sections of the Eastern District route. All told, the city of New York now has outstanding contracts for dual system construction on city-owned lines aggregating $140,516,385, of which $69,462,918 is on lines for operation by the Interborough Rapid Transit Company and $71,073,466.54 on the New York Municipal lines. A portion of the total in each case will be paid for by the companies out of the contributions made by them toward the construction of city-owned lines, namely, $58,000,000 by the Interborough and $13,500,000 by the New York Municipal. Roughly speaking, the dual system agreements call for the construction of about 80 miles of new subway and elevated roads on city-owned lines, with about 260 miles of single track. The contracts already let cover about 50 miles of the total road mileage, so that it may be said that about five-eighths of the contracts on city-owned lines have been awarded.

During the week ended Oct. 3 a fire occurred in the underground portion of the Lenox Avenue division of the existing subway near 142nd Street. A work-train, loaded with papers and other refuse which were being taken out of the subway, was run into by another train and caught fire as a result of the collision. The subway for blocks was filled with smoke, and the fire department had difficulty in extinguishing the fire. Some apprehension was caused by the occurrence, and Commissioner Milo R. Maltbie, acting chairman of the Public Service Commission for the First District, issued a statement calling attention to the fireproof character of the subway and the precautions which the commission has taken to prevent fires. The theory of the commission is to make the subway fireproof and to keep it free of inflammable materials, so that if a fire should start it would have little or nothing to feed upon. The occurrence in question was most unusual, and was really due to the efforts made by the company to prevent fire, for the work-train was carting away papers and other refuse which, if allowed to remain in the subway, would become a fire menace. The commission's engineers are investigating the recent accident, and if it is found that anything further is needed as a fire precaution to protect the subway travel the commission will take prompt action.

Timothy S. Williams, president of the New York Municipal Railway Corporation, has notified the Public Service Commission for the First District that the entire Liberty Avenue extension of the Fulton Street elevated railroad in Brooklyn will be completed about the first of next year, after which it will require two or three months to finish the stations. He, therefore, holds that it would be inadvisable to attempt the operation of that portion of the line running as far as Ozone Park before the entire line is completed and ready for operation. The company had been asked by the commission, in response to requests from residents of the Ozone Park section, whether that portion of the line could not be placed in operation as soon as it is completed.

LABOR RELATIONS IN LOS ANGELES

At the recent session of the United States Commission on Industrial Relations in Los Angeles, Cal., G. J. Kuhrts, chief engineer of the Los Angeles (Cal.) Railway Corporation, summarized the attitude of the company toward labor as follows:

"As a public service corporation responsible to the public for efficient and regular service, we cannot submit to the general good feeling and interest of our employees to maintain efficiency and allay strife, and as we cheerfully accord the men interviews if they have grievances and uniformly give them fair treatment, the best of feeling rules. We recognize that the contented man is a business asset. We have never had a general strike, we have never called on the city authorities for protection, and we have never asked for an injunction. We operate as an open shop; I presume it would be called such. We do not discriminate against union men. In the mechanical departments, in construction and repair work, we have many union men. There is no organization of our men except a recreation association. Officials and men get together in picnic, dances, smokers, and sometimes discuss matters of general interest to us. We are always ready to consider complaints, to hear any employee and make amends if a mistake has been made. As responsible heads we have to be the final judges, but all the heads of departments have worked up from the bottom and are in sympathy with the employees. Since 1901 our schedule of wages has been raised voluntarily five times, without request of the employees. We keep in close touch with economic conditions and whenever they justify it we raise our standards."

At the same hearing A. B. Merrihew, assistant superintendent, described conditions of hiring and discharging trainmen in his department. He said he began as a conductor. He said the average run was nine and a half to ten hours. Certain runs were not operated Sundays, but if a man wanted to he could work 365 days in the year. Mr. Merrihew described the record kept of each man, which he called a "record suspension only," a modification of the Brown system. Violations of rules are entered on the record and men are suspended, but there is no system of fines. Every man was encouraged to aspire to a higher position. Mr. Merrihew stated that he had had no experience with strikes except one in 1903 that lasted "about fifteen minutes," a strike of thirteen men.

NEGOTIATIONS FOR POLE REMOVALS AT SPRINGFIELD, MASS.

The city planning commission of Springfield, Mass., has submitted a report to the Board of Aldermen recommending that the trolley poles on Main Street between the Union Station and State Street be removed and span suspension substituted, with wires attached to buildings. The board was informed through C. V. Wood, vice-president of the Springfield Street Railway, that if the public authorities so request the company will co-operate by removing the poles at its own expense, on condition that the property owners whose buildings are to be utilized grant the company perpetual right of wire attachment. The company also desires that the negotiations with the property owners shall be conducted by the city and will require an agreement freeing the road from all liabilities in connection with these wire attachments. Fifty-eight poles are located in the district, which is in the heart of the business section, and the company reports that all but nine poles can be removed. Four of the latter are located on Court Square, with no available buildings for span wire attachments in the immediate vicinity, while the other five poles are equipped with electric switch connections, which may in some cases be changed. Royal B. Daggett, chief of the Springfield fire department, has informed the planning commission that he sees no objection to the installation of span suspension with building attachments in the above district, and in response to a recent inquiry the New England Insurance Exchange, Boston, has informed the board that it will make no objection to the change if double strain insulators are inserted in the span wires on each side of the trolley wire, one being at a point near the trolley and one near the building. The Exchange prefers that, as a rule, span wires shall not be attached to frame buildings, but will make no objection if such attachments are required in a few instances.

REDRAFTING THE PROPOSED TOLEDO ORDINANCE

Following a meeting of the franchise committee of the City Council in the office of Mayor Keller, at Toledo, Ohio, on Oct. 1, the announcement was made that members would give all their time to the work until the draft of a franchise is completed and ready to present to the Toledo Railways & Light Company. Mr. Hasenzahl, Vice-Mayor, said that Councilman Dotson was working out the fare clause, while City Solicitor Thurstin was engaged on the provision for municipal ownership. Mr. Dotson said members had found that they could make no headway in the preparation of a draft by holding occasional meetings. In the former franchise draft, Mr. Dotson said, the fare clause was very brief, because it provided for flat 3 cents, but now conditions were different, as a rate must be fixed until the 3-cent fare is tried out, and in addition provision must be made for a rearrangement of the rate every five years. It would seem from this that the committee has taken up the suggestion made by the Toledo Citizens' Franchise Committee relating to the readjustment of the rate of fare at stated periods and that the 3-cent rate is to form a basis upon which to make these readjustments. Mr. Dotson said that the clauses which had been agreed upon by the committee and the company will not be changed and that the only important matters remaining relate to the rate of fare and the clause providing for municipal ownership.

On Sept. 30 the Toledo *News-Bee* published a statement to the effect that the contempt cases against its editor and business manager had been dismissed by Federal Judge John M. Killits. Judge Killits is quoted as saying that the step taken by the paper "is a distortion and perversion of an act of courtesy accorded counsel in the case." Instead of dismissing the charges the court directed the district attorney to file papers adding to the charges already made, but in no way changing the previous order.

SURFACE RAILWAY TRAFFIC IN CHICAGO

Henry A. Blair, chairman of the board of operation of the Chicago Surface Lines, controlling all the surface railroads of Chicago, was quoted recently in part as follows:

"We feel that the surface lines are doing fine in view of general prevailing conditions. Our traffic is running a fraction of 1 per cent above last year, which showed a normal gain. We have been able to reduce operating expenses to a point where the charge for the year has been at the rate of 72.76 per cent. This will enable us to show an increase in net earnings over last year. The decrease in traffic is due almost wholly to a falling off in the manufacturing districts.

"The trunk lines of the system continue to show increases. The situation is perhaps better in Chicago than some other centers from which we have heard. We shall put on the entire system about 155 new cars between now and the first of the year. And we are keeping up the lines to the maximum of efficiency. It will be necessary, however, to watch closely all expenditures.

"What we shall be able to do in the way of extensions next year must depend in considerable measure upon money market conditions. The companies could not afford to bring out bonds in a market like this. The prices they would command would be so low as to make the financing appear necessitous. Such a condition does not obtain. The necessary expenditures are well within proper appropriations for the same and we shall plan with the view of maintaining this policy.

"Speaking for the Chicago Railways alone, our shareholders have no reason to feel other than comfortable. While the fact has never been announced in connection with issues of securities, we have a renewal fund of $1,700,000. This is cash in bank and is inviolate except for the purposes for which it is appropriated. We are able to keep the property in the condition it should be."

EMPLOYEES AS STOCKHOLDERS

Outline of Plan Under Which American Cities Company Employees Subscribe for Preferred Stock

The plan of the American Cities Company, New Orleans, La., to have the employees of its subsidiary companies become holders of preferred stock has been carried to a conclusion with subscriptions to approximately 1850 shares of stock, averaging two shares to each subscriber. The subscriptions to the stock were voluntary on the part of the employees. Employees receiving a salary of $1,000 or less were entitled to a maximum of two shares each, while employees receiving more than $1,000 were entitled to an amount of stock at par value equivalent to 40 per cent of the annual salary, this percentage to be adjusted to the nearest even $100. The plan provides that on successive pay days at intervals of a month a minimum of $2 a share shall be deducted from the salary of the subscriber. The subscriber, on the other hand, has the privilege of increasing his monthly instalments to an amount not to exceed 25 per cent of his monthly wages. Dividends declared on the stock held by subscribers are to be credited to the holders of the stock, except that 6 per cent a year is to be charged on the unpaid monthly balance of the purchase price of the stock. The plan contemplates an extension of credit in the case of sickness to employees purchasing stock, such employees being excused from not more than three successive payments. Where this extension is taken advantage of the period of payment is extended to make up the deficit. The stock of course remains in the hands of the company until fully paid for. Monthly payments of $2 a share contemplate the liquidation of the total subscription in twenty-six months, payments of $3 a month contemplate liquidation in eighteen months, $4 a month contemplate liquidation in fourteen months, $5 a month in eleven months, and $6 a month in nine months. Subscriptions are to be cancelled at the request of the subscriber, by the subscriber leaving the service, or by failure of the subscriber to make payments when due on two successive pay days unless excused on account of illness.

It is planned in the case of subscriptions which are cancelled to return to the subscriber the exact amount of the payments made on account, with interest at the rate of 4 per cent a year. Stock fully paid for will be issued in the name of the subscriber, without restriction as to its subsequent sale by him. As an inducement to subscribers to retain their stock the company has offered on Jan. 1 following the delivery of the stock to the subscriber and on each succeeding Jan. 1 for four years, to pay the holder a bonus in the nature of wages for each share up to a total of five shares, such payment to be made as follows: on the first succeeding Jan. 1, $2 a share, on the second succeeding Jan. 1, $3 a share, on the third succeeding Jan. 1, $4 a share, and on the fourth succeeding Jan. 1, $5 a share. The right is extended to subscribers to designate the person or persons to whom, in the event of their death, they desire the company to pay all amounts in connections with subscriptions which otherwise would be payable to their estates. In making a settlement in the case of death the company will account not only for the payments which have been made, including such amounts as had been applied from dividends, but also for any increased value in the stock at the time of the death of the subscriber.

The circular from the American Cities Company containing the offer to its employees was dated June 22 and was addressed to the officers and employees of the American Cities Company and its subsidiary companies. It was headed "First Annual Allotment of Stock to Employees," and was signed by J. S. Pevear, vice-president of the company.

SIR ALBERT STANLEY HONORED

Sir Albert Stanley, managing director of the Underground Railways, was presented with a testimonial recently. The fund emanated entirely from the staff. It was stipulated that no man could contribute a larger sum than 1d. The employees of the Metropolitan District Railway, London Electric Railway, Central London Railway, City & South London Railway, London General Omnibus Company, Associated Equipment Company and the London United Tramways contributed approximately 20,000d. The presentation took the form of a silver tea and coffee service, and a handsome album containing 20,000 signatures of the staff. The inscription was as follows: "Sir Albert Stanley. From nearly 20,000 employees of the T. O. T. companies, in appreciation of the honor conferred by His Majesty the King—June 22, 1914." The album has been divided into T. O. T. sections, the first section of the book under the letter "T" containing the names of the employees on the railways; the second section under "O" the names of the London General Omnibus Company and the Associated Equipment Company's employees, and the third section under "T" the signatures of the London United Tramways employees. In acknowledging the gift Sir Albert stated that he had been much assisted in his work by the support which he had received from the employees and had always striven to do what he could for them. His greatest satisfaction in connection with the honor recently bestowed upon him had been in the universal expression of satisfaction and congratulation on the part of the men.

Washington Valuation Partially Completed.—With the valuation of the properties of the Capital Traction Company practically completed, the Public Utilities Commission of Washington, D. C., awaits information as to the holdings of the Washington Railway & Electric Company to enable it to begin investigation of the reasonableness of the rates maintained by the companies. Headed by Edward W. Bemis, Chicago, the investigators have been at work since the middle of May.

Maine Accepts Public Utilities Act.—The public utilities act, passed by the last Legislature and suspended under the referendum act so that the voters might pass upon it, was adopted by a vote of nearly two to one at the recent state election in Maine, according to a tabulation of unofficial returns from two-thirds of the State. The tabulation showed 43,717 in favor and 23,757 opposed to the new law, which when it becomes effective following Governor Haines' proclamation of the result of the vote, will create a commission to control all the public utilities of Maine.

Bus Line Not a Common Carrier.—The Idaho Public Utilities Commission has decided that an auto bus line does not come under the definition of a common carrier. Parties who established an auto bus line in Pocatello applied for a certificate of public convenience and necessity to operate the line. The commission did not write a formal opinion, but gave the applicants to understand that a certificate was not necessary. Since then a second application for a certificate has come from other parties wishing to establish a similar system in the same city.

New Railway in Pernambuco.—According to P. Merrill Griffith, American Consul at Pernambuco, Brazil, a new electric railway and light company was installed in that city recently. As the result of the general scheme on the part of the present administration of beautifying and modernizing the city, numerous blocks of old buildings were also being torn down and rebuilt with up-to-date structures and new avenues and parks were being laid out. On account of the European war, however, construction and engineering work has been temporarily suspended.

Turnstile at Cleveland Union Station.—In order to accommodate passengers at the Union Station and make it possible for cars to leave on schedule time, the Cleveland Railway will put in a turnstile in the shelter house that has been maintained there for some time. Passengers will then pay their fares before boarding the cars. The city desired this improvement so that people coming in would be able to pay the 3-cent fare and thus give the low-fare idea more publicity through the traveling public. Visitors to the city usually would pay the 5-cent fare without thinking anything about the matter of the 3-cent fare in Cleveland.

Terms of Service in Cleveland.—At a meeting in Acme Hall on the evening of Sept. 30, attended by 800 of the platform men of the Cleveland (Ohio) Railway, the proposition of J. J. Stanley, president of the company, regarding terms of service, was voted down for the second time. The men then decided to submit the matter to arbitration. International President W. D. Mahon, Patrick J. Shea, chairman of the international executive board, and a committee of local men will ask Mr. Stanley to join in arranging for arbitration at an early date. The men contend that the present schedules are not in conformity with the old agreement.

Pittsburgh Subway Franchise Ordinance Introduced.—An ordinance for a subway franchise was presented to the Pittsburgh City Council on Sept. 29 and was at once referred to the committee of public service and surveys. The measure was prepared by the city law department and A. E. Anderson, counsel for the Pittsburgh Subway Company, which is bidding for the franchise. The company is creating sentiment in favor of the granting of a subway franchise by direct advertising at the Pittsburgh Exposition Building, in which the annual exposition of the products of eastern Pennsylvania is held. Approximately 200,000 persons visit the place during each of the six or seven weeks it is open each fall. The company has rented wall space near the entrance to the music hall. The appeals are brief. They set forth what the company wants and what it intends to give in return for the franchise it asks.

President Callery on Traffic in Pittsburgh.—J. D. Callery, president of the Pittsburgh (Pa.) Railways, has sent a lengthy communication to Mayor Joseph G. Armstrong, replying to the demands made by the city for better service by the company. Mr. Callery asserts that most of the improvements have already been made. Some of the proposed changes are objected to, but Mr. Callery says that he and the other officers of the company are willing to go into a full discussion of the improvements with the Mayor and the City Council. He says that a universal transfer system would not be just to the company, and adds that on the average the patrons of the company are now more than justly treated as to the mileage secured for one fare. In the matter of routing, Mr. Callery says it is not feasible to route cars through the city, as the routes cannot be balanced when this method is attempted. Improvements, it is admitted, could be made, but it is asserted that they depend upon the granting of new franchises.

Kercheval Avenue Extension, Detroit.—After a delay of several months the Common Council of Detroit, Mich., has adopted a resolution providing for the construction of an extension of the Kercheval Avenue line to the St. Jean Road. The delay was caused by the opposition of one of the Aldermen representing the ward through which the line will run. He wanted the line extended a considerable distance further through unimproved property, a condition which the Detroit United Railway refused to meet. The extension of the line to the St. Jean Road is in accordance with the agreement entered into last April at the time of the adoption of the resolution providing for the construction of the Grand Belt line, one of the conditions of the construction of the latter being that the company would not go beyond the St. Jean road with the Kercheval line. The Grand Belt line is being held up pending a decision by Judge Murphy in circuit court as to the right of the company to construct a clearance curve at Junction and Dix Avenue. Suit to restrain the company from constructing such a curve because it would overhang the sidewalk at this point was begun by a property owner in the vicinity.

PROGRAM OF ASSOCIATION MEETING

National Association of Railway Commissioners

The twenty-sixth annual convention of the National Association of Railway Commissioners will be held in Washington beginning Nov. 17. The association is composed of the members of the Interstate Commerce Commission and of all the state railway commissioners. Chairman Harlan and C. A. Prouty, director of the physical valuation work of the federal commission, will address the convention, while the remainder of the session will be given over to a discussion of special reports.

Financial and Corporate

RECENT FINANCIAL TENDENCY

The general outlook continues good. Not one or two, but many factors enter as contributing causes. Securities are being traded in in increasing numbers. Dealings through the Stock Exchange Clearing House at or above the final figures of July 30 amount to around 6000 shares a day, while unlisted stocks, dealt in on a freer basis, are in some instances being purchased at an advance. Bond transactions are being made in amounts considered very encouraging. As yet there has been little trading in public utilities. In this connection *Financial America* says that brokers with utility orders in hand are rigidly adhering to the agreement not to sell at prices under July 30 quotations.

During September less than $15,000,000 of securities was put out, and all but $1,500,000 of these was necessary to meet maturing securities. In September, 1913, corporate financing totaled $187,000,000. Dividends and interest due on Oct. 1, for which checks were mailed, amounted to $159,500,000 as compared with $160,000,000 a year ago. Of this total, public utilities contributed $16,985,326. Fourteen corporations passed, deferred or reduced their respective dividends during the week ended Oct. 3. Of these five were companies controlling electric railways, the Porto Rico Railways, the Aurora, Elgin & Chicago Railroad, the American Public Utilities Company, the West Penn Traction Company and the Puget Sound Traction, Light & Power Company. According to the *Wall Street Journal*, since Jan. 1, 1913, 160 corporations have either passed, reduced or deferred their dividends. Of this number, sixty-nine companies have reduced, passed or deferred action on their dividends since Aug. 1, the date of the declaration of war.

CLEVELAND RAILWAY STOCK ISSUE AND OPERATING RESULTS

The directors of the Cleveland (Ohio) Railway on Sept. 28 authorized the sale, subject to the approval of the Ohio Public Utilities Commission, of additional capital stock at not less than par in an amount equal to 10 per cent of the stock outstanding on Oct. 1. The proceeds will be used for extensions, betterments and improvements already approved or proposed by the City Council. Stockholders of record on Oct. 1 are offered the right up to Oct. 15 to subscribe for the new stock pro rata, payable one quarter or more each on or before Nov. 1, 1914, and Jan. 1, 1915, and the remainder in one or more installments on sixty days' notice. The company reserves the right to limit the amount of the first two payments. As noted in the ELECTRIC RAILWAY JOURNAL of Sept. 19, the commission recently authorized the sale of not less than $1,068,500 of stock at par, but this is not being offered to stockholders.

The income statement of the company for August, based on ordinance allowances, contains the following items: operating revenue, $652,696; car-mile allowances for maintenance and operation, $546,963; net operating revenue, $105,733; non-operating income, $2,716; gross income, less allowances, $108,449; taxes, $38,813; income, less allowances and taxes, $69,636; interest, $141,726; deficit, $72,090; special allowances, $18,000, and net deficit, $90,090. Based on actual expenses items are charged as follows: maintenance and operating expenses, $559,934; net operating revenue, $92,762; gross income less expenses, $95,578; income, less expenses and taxes, $56,655; deficit, $85,661; obsolete property, $12,000, and net deficit, $97,061.

The deficit of $97,061, based upon actual experience, compares with $5,041 last year. Under the ordinance allowances the deficit of $90,090 compares with $16,093 for the previous year. The actual amount spent in maintenance and operation was much larger than the allowance, but the proportion of last year was very nearly kept. The interest fund at the end of August was $222,654, which is a material reduction from the amount reported at the end of the previous month. The charge of 1 cent for transfers beginning on Sept. 1 will make a difference in this fund, but in all probability a long period will elapse before it reaches $700,000, the amount necessary before the fare can be reduced to 3 cents.

ANNUAL REPORTS

The American Railways

The statement of income, profit and loss of The American Railways, Philadelphia, Pa., for the fiscal year ended June 30, 1914, follows:

Income from sub-companies	$981,943
Miscellaneous income	54,418
Gross income	$1,036,361
General expenses	$18,839
Legal expenses	375
Depreciation of office furniture and engineering instruments	1,279
Taxes	15,000
Interest on funded debt	407,039
Total deductions from income	$442,532
Net income	$593,829
Dividends paid and accrued on preferred capital stock	$140,000
Dividends paid on common stock	402,789
Total dividends	$542,789
Surplus for the year	$51,010
Surplus at the beginning of the year	648,436
Additions to surplus through the profits from sale of the Johnstown Passenger Railway	548,469
Total	$1,247,945
Deduct:	
Contributions to the reserve for depreciation of the subsidiary companies	$500,000
Amount set aside for United States income tax arising from the profits on sale of property	5,485
Other adjustments within the year	187
Total	$505,672
Surplus at close of the year	$742,273

The gross receipts for the subsidiary companies for the year ended June 30 were $5,563,289, a gain of $399,281, or 7.73 per cent over the previous year. After payment of all operating expenses, interest and taxes, the net income was $593,829. Dividends amounting to $542,789, an increase of $50,940, were paid, leaving a balance of $51,040. During the year the Johnstown Traction Company exercised its option to purchase the Johnstown Passenger Railway, which resulted in a net profit of $548,469. Of this $500,000 was set aside as a special depreciation fund to be apportioned among the different properties of the company; $5,485 to cover the contingency on this profit, subject to the federal income tax, and $187 for adjustment of interest, leaving $42,797 to be added to surplus. A combination of this with the above balance of $51,040 gave a surplus for the year of $93,837 and a total surplus as of June 30, 1914, of $742,273.

During the year the company spent on maintenance of track, roadway and equipment (including depreciation) 19.4 per cent of the gross receipts. There was charged out of earnings to payments for sinking fund $26,769. Taxes amounting to $239,752 were paid—more than 4.3 per cent of the gross receipts. The insurance and contingencies reserve fund is now $82,242, an increase of $8,636. The employees' pension fund has an investment of $10,127. During the year $832,995 of new capital was spent for sundry improvements. The total number of passengers carried was 106,825,683, an increase of 6,482,632, or 6.46 per cent.

The report gives brief descriptions of the progress of the subsidiaries. During the year the gross receipts of the Altoona & Logan Valley Electric Railway, Altoona, Pa., increased $47,186. One new snow sweeper was bought; orders were placed for nine new cars, and eight cars were altered to the pay-within type. The Bridgeton & Millville Traction Company, Bridgeton, N. J., purchased four new cars. The receipts of the Chicago & Joliet Electric Railway, Joliet, Ill., increased $25,010. Ten new steel cars were bought and eleven double-truck cars were changed to the prepayment type. The Lynchburg Traction & Light Company, Lynchburg, Va., showed a gross gain of $37,855, or 8 per cent, divided among the departments as follows: Railway, $16,324; electric light and power, $15,005; gas, $6,526.

The gross business of the Ohio Valley Electric Railway, Huntington, W. Va., increased more than $68,000 during the year, of which the railway department gained $38,900 and the lighting companies more than $29,000, a combined gain of nearly 12 per cent. Two 30-ton freight cars were bought and one 35-ton freight car was built in the company's own shops. The receipts of the Peoples Railway, Wilmington, Del., increased $61,696 during the year. The earnings of the Roanoke Railway & Electric Company, Roanoke, Va., increased $59,464. Thirteen cars were rebuilt to the pay-within type. The Scranton (Pa.) Railway and the Springfield (Ohio) Railway showed satisfactory increases during the year. The Scranton Railway purchased five new all-steel cars and orders were placed for ten additional. The Springfield Railway purchased and put into service ten new all-steel cars with motor equipment. Besides the above information the report contains various details regarding the track, power house and other improvements made by each company.

The Westinghouse Air Brake Company

According to the condensed financial statement of the Westinghouse Air Brake Company, Wilmerding, Pa., for the fiscal year ended July 31, the net earnings from all sources fell from $6,064,778 in 1913 to $3,482,994 this year, owing to the general business depression and the present railroad situation. The inventories totaled $5,625,024, as compared to $4,307,505 last year, while cash on hand decreased from $4,050,495 to $2,479,096 and accounts and bills reecivable from $4,865,762 to $3,132,723.

Depreciation charges have been governed largely by net earnings, varying in recent years from $43,960 in 1908 to $429,824 in 1910. After appraisals this year, however, the present actual values of factories has been increased $550,165, and this value credited to a general reserve account, with which the various reserves of all the companies have been consolidated. This will provide for renewals, replacements, adjustments of inventories and all extraordinary losses. Depreciation charges for the year are included in the adjustment, but hereafter depreciation of buildings and machinery will be charged at a predetermined rate against current earnings as a part of the cost of production.

Last summer a committee inspected the foreign brake plants in which the company is interested and found that the company's holdings of their stocks are carried on the books at conservative valuations. The unexpected outbreak of the war injected uncertain factors, but the directors believe that, barring a temporary dividend reduction for the companies in question, no further loss need be apprehended.

UTAH PURCHASE COMPLETED

Utah Securities Corporation Through New Subsidiary Gains Control of Electric Business in Salt Lake City and Ogden

The Utah Securities Company, as predicted in the Electric Railway Journal of Sept. 12 and Sept. 26, has purchased a 98 per cent interest in the stock of the Utah Light & Railway Company. The property of the latter company is now owned by the Utah Light & Traction Company, all of whose stock other than that which accrues to the minority holders of the Utah Light & Railway Company is now owned by the Utah Securities Corporation. The Utah Light & Traction Company was formed Sept. 18 by a consolidation of the Utah Light & Railway Company and the Salt Lake Light & Traction Company, which was recently organized by the same interests with a paid capital of about $1,000,000. The capital stock of the new company will approximate $1,000,000 in $25 shares. The minority stock of the Utah Light & Railway Company has been offered in exchange either cash or stock in the new company.

The Utah Light & Traction Company has issued a mortgage to the Bankers Trust Company, New York, as trustee, to secure an unlimited issue of first and refunding 5 per cent thirty-year gold bonds, dated Oct. 1 and callable on any interest date at 105 and interest, par $1,000, $500 and $100 (coupon) and $1,000 (registered). The bonds are protected by a sinking and improvement fund of 1 per cent of the bonds outstanding from 1917 to 1919, 2 per cent from 1920 to 1934, and 2½ per cent from 1935 to 1943. Of the bonds, $11,661,000 have been issued, of which $3,816,000 are reserved to provide for underlying liens as follows: $745,000 of Utah Light & Power Company first mortgage gold 5's; $1,113,000 of Utah Light & Power Company consolidated mortgage gold 4's; $1,472,000 of Consolidated Railway & Power Company first mortgage gold 5's, and $486,000 of Utah Light & Railway Company first consolidated 5's. The remainder of the bonds were sold to cancel the large floating debt of the Utah Light & Railway Company and to provide the necessary cash to pay the Utah Light & Railway Company and the Salt Lake Light & Traction Company stockholders who elected to take cash in payment or exchange for their holdings after the merger. The bonds were not sold to bankers and it is expected that none will be offered to the public. The $993,000 of Utah Light & Railway Company first consolidated 5's and $2,000 of Utah Light & Power Company consolidated 4's, formerly owned by the Oregon Short Line Railway, have been turned over as part consideration for the property acquired and have been deposited as additional security for the new first and refunding mortgage.

Just how the properties will be handled by the new interests is a matter yet to be worked out. It is still undetermined whether the Utah Light & Traction Company will be merged into the Utah Securities Corporation, or again whether the gas and electric light business of the new property will be turned over to the Utah Power & Light Company, which is also controlled by the Utah Securities Corporation, and the new company left to operate merely the traction property.

Chicago & Oak Park Elevated Railroad, Chicago, Ill.—Judge Kohlsaat in the United States District Court has ordered Samuel Insull, receiver of the Chicago & Oak Park Elevated Railroad, to present within ten days a petition for permission to issue receivers' certificates to raise funds for elevating the tracks near the western terminus at a cost between $1,500,000 and $2,000,000. Federal Judge Kohlsaat, taking further action in the suit brought by the Public Utilities Commission of Illinois to enforce its order to compel the Chicago & Oak Park Elevated Railroad to elevate its tracks in Oak Park, Ill., has issued a temporary injunction. This restrains the commission from proceeding with its suit in the Superior Court by writ of mandamus and thus prevents it from prosecuting its suit.

Commonwealth Power, Railway & Light Company, Grand Rapids, Mich.—The Commonwealth Power, Railway & Light Company has declared its regular dividend of 1½ per cent, preferred, and 1 per cent, common, payable on Nov. 2 to holders of record on Oct. 16. It is reported authoritatively that the company in August showed increases of 5.88 per cent in gross earnings and 12.6 per cent in net earnings over August, 1913. The totals for the twelve months ended Aug. 31 were the largest gross and net earnings in the history of the ocmpany. This showing is said to indicate the strength of public utilities whose operations cover a large number of communities.

Indianapolis, Columbus & Southern Traction Company, Columbus, Ind.—The Bartholomew Circuit Court on Sept. 22 appointed the Commercial Trust Company, Philadelphia, Pa., as trustee under the mortgage of 1903 in place of the Trust Company of North America, resigned.

Interurban Railway & Terminal Company, Cincinnati, Ohio.—The Common Pleas Court at Cincinnati has appointed Charles S. Thrasher of Cleveland and Charles N. Leslie of Cincinnati as receivers of the Interurban Railway & Terminal Company on the application of the Westinghouse Electric & Manufacturing Company. The manufacturing company charged that the railway had defaulted in the payment of its interest on its bonds and was insolvent. The railway joined in the application. Frank Dinsmore, one of its attorneys, stated that among the various causes for the financial trouble was the franchise obligation requiring the company to charge no more than five cents as the fare between Kennedy Heights and Pleasant Ridge, and Cincinnati. With three cents of this going to the Cincinnati Traction Company the interurban company suffered a loss.

New York (N. Y.) Railways.—It has been decided that the interest payment on the New York Railways adjustment income bonds for the six months ended Oct. 1 should be 1.288 per cent instead of 1.24 per cent, as provided for in the summarized net income statement originally prepared by the company. This decision was reached by the board of arbitration composed of H. H. Porter, James Warwick and W. G. Ross, whose selection was noted in the ELECTRIC RAILWAY JOURNAL of Sept. 19. Charles F. Cushman, secretary of the proxy committee, has sent a circular to the holders of the adjustment income bonds, notifying them that at the annual meeting in December they are entitled to elect five of the eleven directors. The following committe has consented to receive proxies for this meeting: Darwin P. Kingsley, president New York Life Insurance Company, New York; William A. Day, president Equitable Life Assurance Company, New York; Haley Fiske, vice-president Metropolitan Life Insurance Company, New York, and Allan Forbes, president of the State Street Trust Company, Boston.

New York City Railway.—Judge Lacombe on Sept. 28 filed two opinions in the Federal District Court regarding the old surface railway litigation. In one opinion he affirmed the conclusion of the special master in the matter of the petition of the receiver of the New York City Railway for an accounting by the receiver of the Metropolitan Street Railway. In regard to the sale of scrap and payments made to the so-called controlled companies aggregating $169,694, Judge Lacombe disallowed the payment of $55,000 by the Union Railway and stated that some of the other items have been disposed of by mutual concessions. In the second opinion, which concerned the claim of the Metropolitan Street Railway for $2,000,531 against the New York City Railway for damages for breach of lease, he allowed $1,700,452 for keeping the tracks and roadway in good condition and $15,000 because the old coal conveyor was not put in proper condition. He disallowed the off-set of $63,821 for the expense of renting buildings, because of fire destruction, and permitted the Farmers' Loan & Trust Company to share in the proceeds of the claim.

Northern Electric Railway, Chico, Cal.—On Oct. 1 the General Railway Signal Company applied to Judge Dooling in the San Francisco United States District Court for the appointment of three receivers for the Northern Electric Railway. The company, which joined in the application, has defaulted interest on the $3,750,000 of first mortgage fifty-year 5 per cent bonds due on Oct. 1. Interest on $6,652,000 of first and consolidated mortgage 5's was defaulted on June 1. The company (Marysville and Colusa branch) recently filed an application with the California Railroad Commission requesting approval of $37,079 of notes previously issued.

Ohio Service Company, Columbus, Ohio.—The Ohio Public Utilities Commission has authorized the Ohio Service Company to issue $630,000 of capital stock to be used in the purchase of electric railway and light properties at Coshocton, Canal Dover, Cambridge, New Philadelphia, Uhrichsville and Dennison. Of this $350,000 is to be paid to the Midland Power & Traction Company, Cambridge, for a railway line between that place and Pleasant City, together with a light and an ice plant; $270,000 for light plants at Canal Dover, New Philadelphia, Uhrichsville and Dennison and $10,000 to the Lafayette Light & Power Company for a transmission line connecting all the towns mentioned above. The sale of the properties was authorized on June 4.

Porto Rico Railways, Ltd., Toronto, Ont.—The directors of the Porto Rico Railways, which controls the Porto Rico Railway, Light & Power Company, San Juan, Porto Rico, have decided to pass the quarterly dividend payable on Oct. 1 on the $3,000,000 of common stock. From October, 1911, to July, 1914, 1 per cent was paid.

Second Avenue Railroad, New York.—The Second Avenue Railroad has defaulted on the payment of the principal of the $3,140,000 of 6 per cent certificates due on Oct. 1. The semi-annual interest due on that date was paid. The default of principal is in effect a forced extension of the note issue, which is expected to continue to bear 6 per cent interest. In this connection it may be noted that plans for the reorganization of the company, which has been operated by George W. Linch as receiver for some years, were disclosed on Oct. 3 when Justice Platzek of the Supreme Court denied an application for an order directing the receiver to account for his acts and permitting the collection of a judgment for personal injuries through an execution against the railroad. The receiver showed that at the meeting of the reorganization committee, when it was determined not to extend the receiver's certificates, it was decided to present to the Public Service Commission for its approval a plan for the reorganization of the company, and to put such a plan into effect as soon as normal financial conditions are restored. The court said that in view of this plan it would be unreasonable to direct an accounting and to issue an execution.

DIVIDENDS DECLARED

Cincinnati, Newport & Covington Light & Traction Company, Covington, Ky., quarterly, 1⅛ per cent, preferred; quarterly, 1½ per cent, common.

City Railway, Dayton, Ohio, quarterly, 1½ per cent, preferred; quarterly, 2 per cent, common.

Columbus, Newark & Zanesville Electric Railway, Cincinnati, Ohio, quarterly, 1½ per cent, preferred.

Commonwealth Power, Railway & Light Company, Grand Rapids, Mich., quarterly, 1½ per cent, preferred; quarterly, 1 per cent, common.

Dayton & Troy Electric Railway, Dayton, Ohio, 1¼ per cent, preferred.

Georgia Light, Power & Railways Company, Macon, Ga., quarterly, 1½ per cent, preferred.

Green & Coates Streets Passenger Railway, Philadelphia, Pa., quarterly, $1.50.

Kentucky Securities Corporation, Lexington, Ky., quarterly, 1½ per cent, preferred.

Northampton (Mass.) Street Railway, 2½ per cent.

Ottawa (Ont.) Electric Railway, quarterly, 3 per cent.

Ottumwa Railway & Light Company, Ottumwa, Ia., quarterly, 1¾ per cent, preferred.

Porto Rico Railways, Ltd., Toronto, Ont., quarterly, 1¾ per cent, preferred.

Springfield & Xenia Railway, Springfield, Ohio, quarterly, 2 per cent, preferred.

United Railways & Electric Company, Baltimore, Md., quarterly, 50 cents, common.

Virginia Railway & Power Company, Richmond, Va., 1½ per cent, common.

Youngstown & Ohio River Railroad, Leetonia, Ohio, quarterly, 1 per cent, preferred.

Traffic and Transportation

ROCHESTER SUBURBAN FARES

A Summary Is Presented of the Changes in Fare Effective on the Rochester & Eastern and the Rochester & Sodus Bay Lines

Previous to Jan. 1, 1914, tariffs of the Rochester & Eastern and the Rochester & Sodus Bay lines of the New York State Railways granted the following types of fare:

One way tickets between all points	$0.0175	per mile
Round trip tickets between all points	.0150	per mile
Interchangeable coupon ticket books containing transportation to the value of $12, sold for $10	.0145	per mile
School ticket books, containing $5 worth of transportation, sold for $2.50	.00875	per mile

Effective on Jan. 1, 1914, tariffs were filed with the Public Service Commission of the Second District of New York granting the following types of fare:

One way tickets, between all points	$0.02	per mile
Round trip tickets, between all points	.02	per mile
Interchangeable coupon ticket books, containing transportation to the value of $12, sold for $10	.0166	per mile
Fifty-four-trip commutation ticket books	.0185	per mile (shortest haul)
Between all points 3 miles or more apart—limited to use for calendar month	.0079	per mile (longest haul)
Forty-six-trip school commutation books	.0163	per mile (shortest haul)
Between all points 3 miles or more apart—limited to use for calendar month	.0070	per mile (longest haul)

Effective on July 10, 1914, Supplement No. 1 to tariff was filed with the Public Service Commission changing rulings as to time limit of the fifty-four-trip commutation ticket books and the forty-six-trip school commutation books as follows:

Previous to July 10, the fifty-four-trip commutation tickets were governed by the following ruling as to time limit: "Limited to use during calendar month for which purchased." This was changed to read:

"Limited to use from the date of sale to and including corresponding date of the following month; if there should be no corresponding date in such following month, the ticket will be limited to use within thirty days from and including date of sale."

Previous to July 10 the forty-six-trip school commutation ticket books were governed by the following ruling on time limit: "Limited to use during calendar month for which purchased." This was changed to read:

"Limited to use for one year from date of sale, excepting that they will not be honored during months of July and August."

The above changes were made with the object of satisfying complaints or objections made by patrons to the Public Service Commission on account of the increases in fares which were called for in the tariff filed on Jan. 1, 1914.

The Public Service Commission held several hearings and finally disposed of the complaints by ordering the company to make the following changes in the tariffs by an order which is to be complied with Nov. 1, 1914.

Fifty-four-trip commutation ticket books are to be reduced in price such that, starting with mileage of 5 miles, a reduction of 25 cents is to be made on the price of each book for distance from 5 to and including 7 miles; 20 cents from 8 to and including 17 miles, and 15 cents from 18 miles to and including 43 miles.

The forty-six-trip school ticket books are to be computed on the basis of 75 per cent of the charges made for fifty-four-trip books, for the corresponding mileage.

The order also called for discontinuing the practice of charging an excess fare to passengers paying cash fare on its cars. The tariffs effective previous to Jan. 1, 1914, contained the following ruling as regards cash fares paid on cars:

"Passengers paying cash fares on the cars where fare is more than 5 cents will be charged an excess fare of 10 cents, which will be refunded if duplex fare receipt is presented within ninety days of date of issue to ticket agent at any Rochester & Eastern or Rochester & Sodus Bay line station, where a ticket office is maintained; such excess fare will not apply or be charged to passengers boarding at and destined to points where ticket agency is not maintained, conditioned that said points are not within the city or village limits where ticket office is maintained."

This same ruling was contained in tariffs, effective on Jan. 1, 1914.

Complying with the order of the commission, the company filed a supplement to its passenger tariff, effective on Sept. 1, 1914, covering the above mentioned changes in passenger fares. The passenger tariff which is now effective calls for a 2-cent rate per mile for one way and round trip fares.

NEW JERSEY TRANSFER CASE

Transfer Request Refused, but Petition for Elevated Shelters Allowed

The Board of Public Utility Commissioners of New Jersey has refused the request of the city that the Public Service Railway be compelled to honor transfers at its terminal building in Hoboken between its various surface lines, but holds that the company should be compelled to provide suitable waiting sheds at Washington Street, Willow Avenue and Henderson Street upon its elevated line. Unless the company accepts the latter recommendations an order will issue compelling the erection of waiting sheds in accordance with suggestions contained in the report of the board. In this connection the board draws a distinction between the obligations of a railway to provide waiting accommodations on elevated and surface lines.

The first part of the complaint was directed against the present rule of the company not to honor transfers at its terminal building. For many years the company made a practice of issuing such transfers from Washington Street to the Grove Street and Willow Avenue lines, from Willow Avenue to the Grove and Washington Street lines, and from Grove Street to the Willow Avenue and Washington Street lines. It was admitted in behalf of the city that the present points of transfer offer the shortest route, the quickest passage and are entirely the most convenient places to the transferring passengers. The complaint, therefore, was based upon the ground that while shelter is afforded at the terminal building, it is not provided at the present points of transfer.

There being no complaint involving the running of cars under proper headway and the furnishing of proper service, the board said it was thus stripped of the only grounds upon which it would be justified in making the order requested. In this connection the board added:

"The uniform practice on street railway lines is to transfer at the point of intersection or, if the lines do not intersect, at the most convenient point for the passenger, which usually is that point which will save the passenger time and send him along the shortest route to his destination. The board does not feel justified in granting the prayer of the complaint upon the ground urged, namely, the lack of shelter at these transfer points. Conditions at the present transfer points in Hoboken do not seem to be any different from those in every other city. No shelter is ordinarily provided at transfer points on surface lines in any city.

"The company in this case does not own property at any of the transfer points where shelter might be erected. As the complaint does not allege and the evidence has not established inadequacy of service or failure to give proper service on the part of the respondent, the application upon this phase of the case is denied."

In considering the conditions at the three points complained of as lacking proper waiting-room facilities on the elevated line, the board held that the present accommodations do not afford proper shelter and are incapable of accommodating the crowds waiting for cars. Distinguishing between elevated and surface lines, the board said:

"These elevated stations are four or five blocks apart, and passengers accumulate at them in greater numbers, of course, than at points on surface lines. The boarding points on surface lines, being only one block apart, passengers on such lines usually have an opportunity to avoid inclement weather by availing themselves of the protection of some building. A waiting shed on an elevated railway is of no use unless it accomplishes the purposes for which it was erected, namely, to protect waiting passengers. The failure to provide waiting sheds which will afford protection to persons whom the company invites upon its platforms as passengers, is, in our judgment, a failure to provide either adequate or proper service."

STUDYING TRAFFIC IN KANSAS CITY

The board of control of the Kansas City Railways is making a thorough study of service conditions. The approaching opening of the new union station presents important problems, since traffic currents will be changed in ways hard to anticipate. The new Twelfth Street viaduct is also nearing completion. The company will probably begin laying rails on it within thirty days, and the viaduct will be open to traffic about Jan. 1. This structure provides access to the stockyards district and the jobbing section of the south part of the west bottoms, which has depended upon rather circuitous street car facilities from the business district of Kansas City since the Twelfth Street cable line was shut down. The subject of adjusting service to the proposed Twenty-third Street viaduct and of arranging for the possible reconstruction of the Central Avenue viaduct have not yet reached the point of announcement by the company.

Service Order by Court.—The Court of Appeals handed down a decision on Sept. 21 requiring the Western Ohio Railway to give the people of Cridersville hourly service. The limited cars have used a cut-off which does not pass through the town.

Middlesex & Boston Fare Increase Postponed.—The Massachusetts Public Service Commission has ordered the Middlesex & Boston Street Railway to postpone its proposed increase in fares from a 5-cent to a 6-cent unit, with an additional charge of 1 cent for transfer, until Nov. 2. It is expected that the board will reach a decision in October.

Accident in Springfield.—Nineteen persons were injured, nine seriously, and others more or less shaken up and cut by flying glass when a double truck car on the Westfield division of the Springfield (Mass.) Street Railway left the tracks at the curve at the foot of Tubbs Hill, corner of Elm and Westfield Streets, West Springfield, recently, and turned over on its side.

Skip-Stop in Albany.—Announcement has been made by the United Traction Company, Albany, N. Y., of the elimination of certain stops in Albany and Rensselaer with a view to improving the service. Recommendations to curtail the number of stops were continued in the report of Charles R. Barnes, expert of the Public Service Commission of the Second District of New York, who investigated the service of the company last winter.

Harvard Bridge Transfers Approved.—Supplementing a recent order of the board approving various transfer facilities associated with the opening of the Boylston Street subway in Boston, the Massachusetts Public Service Commission has approved the issue of transfers between inward-bound Harvard Bridge and outward-bound subway cars and between inward-bound subway cars and outward-bound Harvard Bridge cars at the Massachusetts station of the Boston Elevated Railway.

Car Shipment Rate Fixed.—In a decision handed down by the Illinois Public Utilities Commission on Oct. 1 in the case of C. E. Hazlett versus the Illinois Traction Company, the rate for the shipment of street cars over interurban railways when the cars are mounted on trucks and run on their own wheels is fixed. The rate per car for a minimum of 50 miles is 30 cents a mile and for the trailer 15 cents a mile. The plaintiff charged that he had been required to pay what he considered an exorbitant rate for the shipment of two cars from Decatur to Springfield.

State Traffic Commission in New Jersey.—Uniformity in traffic regulations of cities and towns throughout New Jersey is the goal of a movement given definite impulse when Governor Fielder named a commission to draft a proposed uniform measure for adoption all over New Jersey. Job H. Lippincott, State motor vehicle commissioner, is chairman, the two other members being J. V. Hamburg, of Newark, president of the Newark Board of Trade and the Automobile Club of Essex County, and George B. LaBarre, commissioner of public safety at Trenton.

Company Sustained in Revere (Mass.) Transfer Case.—The Massachusetts Public Service Commission has dismissed the petition of residents of Revere, a suburb of Boston, for the establishment of free transfers on the Bay State Street Railway at the junction of Park Avenue and Broadway. The petitioners sought a 5-cent fare to Lynn. The commission states that if the petition should be granted the residents of Lynn would naturally demand transfers from all lines to Revere Beach. This the board deems unreasonable, since the company maintains a 7-cent rush hour fare through the sale of tickets good over the line in question. The petition was dismissed with the recommendation that the company advertise the tickets and make them more readily available to patrons.

Chicago Elevated Railways' Safety Movement.—At the weekly luncheon of the Chicago Jovian League, held at the Hotel Sherman on Sept. 28, J. H. Mallon, assistant superintendent of transportation, delivered an illustrated talk on the "safety first" movement of the Chicago Elevated Railways. This was followed by an address by Dr. H. E. Fisher, special medical examiner of the elevated railways regarding the company's plan in furnishing first aid to the injured. A number of first-aid stations have been established over the railway system at the different carhouses and shops and squads of employees have been trained in first-aid work. In connection with Dr. Fisher's address, a first-aid squad demonstrated the methods used in connection with various kinds of injuries needing attention.

Objection to Running Board.—On Oct. 1 the Ontario Railway & Municipal Board heard the objections of the street railwaymen's union to the continuance of the use of the open cars with running board. The men desire a center aisle substituted for the running board. R. J. Fleming, general manager of the Toronto Railway, said that to abolish the step on the cars would so reduce the seating capacity that it would be necessary to put on an additional 300 cars to maintain the service. This the company could not afford to do. In consequence of the unsettled conditions caused by the war, the receipts were falling off. Even during the exhibition period the decrease was more than $20,000 compared with previous years. The board decided to defer action until its own experts have reported on the matter.

The Hocking Valley Railroad Case.—Interesting developments may grow out of the controversy between the State Public Utilities Commission and the Hocking Valley Railroad over the suspension of electric car service on the Wellston & Jackson Belt Line. The commission ordered the company to resume electric service on Sept. 15. Instead, the company undertook to furnish a steam train service on the old electric schedule. It was announced at the time that this would be done if it was found that the power house was not capable of furnishing power to operate electric cars. The company then appealed the commission's order to the Ohio Supreme Court on the ground that it does not have authority to dictate the kind of service that shall be given. Suit has now been instituted at Jackson, Ohio, to collect $1,000 a day as penalty from the company for refusing to comply with the commission's order, as provided in the latest law governing the duties of that body.

Service Hearing in Washington.—The Public Utilities Commission of the District of Columbia will hold a formal hearing on Oct. 26 for the purpose of considering the adoption of standards of street railway service in the District of Columbia. The object of such standards is formally to establish what service the utilities will be required to furnish, and to simplify the procedure of the utilities in changing their schedules to meet the varying conditions of traffic. The standards which the commission will present for discussion are as follows: Seventy-five seats per 100 passengers during the half hour of maximum traffic during each of the two rush periods of the day; 125 seats per 100 passengers during every hour of the non-rush periods of the day. These figures are the result of a study of the conditions of traffic obtaining in the district and are based on the requirement that the utilities furnish during non-rush hours a seat per passenger and furnish during the half hour of heaviest traffic of rush hours enough cars so that the standing room will not be overcrowded.

Personal Mention

Dr. Arthur W. Elting has been appointed chief surgeon of the United Traction Company and of the Hudson Valley Railway, with headquarters at Albany, N. Y.

Mr. F. E. Whitlock, for nine years superintendent of overhead, third-rail and bonding for the Northern Electric Railway, Chico, Cal., has resigned to devote his attention to his other business interests.

Mr. Charles H. Pegler, Elgin, Ill., has been appointed general attorney for the Aurora, Elgin & Chicago Railway. He assumes the new position on Oct. 1, and will have offices in Elgin and Wheaton.

Mr. George D. Rice, who retired as general superintendent of the Omaha & Lincoln Railway & Light Company, Omaha, Neb., on Oct. 1, was presented with a cut glass water service by the train men in the employ of the company as a token of esteem.

Mr. Eugene F. McKinley has been appointed general counsel for its street railway holdings in the State of New York by the New York, New Haven & Hartford Railroad. This places him in charge of all the legal work of the New York & Stamford Railway and the Westchester Street Railroad.

Mr. B. I. Spock, counsel for the New York, New Haven & Hartford Railroad for Connecticut, has been appointed general solicitor of the company. Mr. Spock reports to Mr. E. G. Buckland, general counsel for the company and vice-president. Mr. Spock's office continues at New Haven, and counsel for the several states will report to General Solicitor Spock.

Mr. S. H. Bennett, for some years auditor of the Hagerstown & Frederick Railway, Frederick, Md., has been appointed general auditor of the company in charge of all the accounting of the road, and also for the Frostburg Electric Company, which was recently acquired by the railway company. Mr. Bennett has long been engaged in railway work, and has been with the railway at Frederick since its inception.

Albert E. Peirce

Mr. Albert E. Peirce, formerly assistant general manager of the Chippewa Valley Railway, Light & Power Company, Eau Claire, Wis., has been elected vice-president of the Wisconsin-Minnesota Light & Power Company, formed to take over the properties of the Chippewa Valley Railway, Light & Power Company, the Chippewa Valley Construction Company and the La Crosse Gas & Electric Company. Mr. Peirce began his electrical career with the Brooklyn Heights Railroad in 1898, where he worked in the shops and the line department. He later served a year and a half in the testing department of the Westinghouse Company at East Pittsburgh ,Pa. After a short experience with the Christensen Engineering Company, installing air brakes in the New England States, he went with Rossiter, McGovern & Company, New York, and for about two years installed apparatus in the East. Mr. Peirce became connected with the Pennsylvania Steel Company, Steelton, Pa., as electrical engineer of the bridge and construction and the frog and switch departments. In 1905 he took charge of the Indian Territory Traction Company at South McAlester, I. T., remaining during the reorganization of that company into the Choctaw Railway & Light Company. Later he entered the General Electric Company power and mining department in the Chicago office. Until the fall of 1907 he was located in Minneapolis, Minn. He became connected with the Chippewa Valley Railway, Light & Power Company at the commencement of its development work.

Mr. L. C. Morris has been appointed traveling passenger and freight agent of the Empire United Railways, with offices at Rochester, N. Y. Mr. Morris is twenty-seven years of age and has been engaged in railroad work for the last nine years. His first work was as stenographer at the Ithaca freight office of the Lehigh Valley Railroad and later assistant cashier at that office. He was subsequently transferred to the office of the district passenger agent in Ithaca as assistant city ticket agent. This position he held for four years. He was then appointed to the Lehigh Valley Railroad as city passenger and ticket agent at Rochester, which position he has held for more than two years.

Mr. Russell Gould, who for the last two years has been superintendent of substations of the Northern Electric Railway, Chico, Cal., has been appointed superintendent of power with jurisdiction over the substations, overhead, third-rail and bonding. Mr. Gould was graduated in 1903 from a five-year course in civil and electrical engineering at the University of Georgia. He spent the next four years at the Schenectady works of the General Electric Company, being employed in the testing and in the drafting departments. For a year he was engaged in life insurance work in Mexico, and during the next four years was connected with the Texas Traction Company as electrical engineer on its Dallas-Sherman-Denison interurban line. This last position he resigned two years ago to become superintendent of substations with the Northern Electric Railway.

OBITUARY

Augustus Wilder Sexton, Jr., treasurer of Westinghouse, Church, Kerr & Company, New York, is dead. Mr. Sexton was born in Staten Island thirty-nine years ago. He is survived by his widow and one daughter.

Arthur W. Jordan, traffic agent and park manager of the Chicago & Joliet Electric Railway, Joliet, Ill., is dead. Mr. Jordan was born in St. Joseph, Mich., on Nov. 28, 1865, and virtually spent his entire life in electric railway traffic and park work. He began his career with the Grand Rapids (Mich.) Street Railway, and in 1904 was appointed assistant general agent and freight agent of the Ohio Electric Railway, Columbus, Ohio. In January, 1908, Mr. Jordan became traffic agent and superintendent of Dellwood Park, controlled by the Chicago & Joliet Electric Railway. For several years he was active in traffic matters and served as chairman of the traffic committee of the Illinois Electric Railways Association.

Gardiner M. Lane, of Lee Higginson & Company, Boston, Mass., is dead. Mr. Lane was at one time assistant to President Charles Francis Adams, of the Union Pacific Railway. He advanced from a clerk in the office of Lee Higginson & Company to partnership in the firm. Mr. Lane was a director in many industrial, railroad and public service corporations, among them the Interborough Rapid Transit Company, New York; Massachusetts Electric Company, Boston, Mass.; Pennsylvania Water & Power Company, Holtwood, Pa.; Puget Sound Electric Railway, Seattle, Wash.; Puget Sound Traction, Light & Power Company, Seattle, Wash.; Rapid Transit Subway Construction Company, New York, and the Seattle (Wash.) Electric Company.

Frank Caum, general manager of the Scranton (Pa.) Railway, is dead. Mr. Caum was born in Harrisburg, Pa., about forty-eight years ago. After attending the public schools he entered the shops of the Pennsylvania Railroad at Harrisburg. Subsequently he went to Rochester, N. Y., and was eventually appointed superintendent of the street railway power station there. He afterwards held similar positions in Jersey City and in Meriden. At the solicitation of Mr. Norman McD. Crawford, now president and general manager of the Reading Transit & Light Company, Reading, Pa., who was manager of the Hartford (Conn.) Street Railway, Mr. Caum entered the service of the company at Hartford eleven years ago as superintendent of the power station on Commerce Street. Afterwards he became superintendent of the Hartford Street Railway, succeeding Mr. John Deloury. When the Connecticut Company absorbed the Hartford Street Railway, Mr. Caum continued with the new owners as manager of the Hartford division about a year. He then accepted the position of manager of the system in Scranton.

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

RECENT INCORPORATIONS

***California Terminal Railway, Sacramento, Cal.**—Application for a charter has been made by this company in California to build an electric railway to go by ferry from San Francisco to some point on the shore of San Francisco Bay or San Paolo Bay and thence through Marin, Sonomo, Napa, Solano, Yolo and Sacramento counties. Branch lines to Petaluma and Napa are also planned. Capital stock, $200,000. Incorporators: C. W. Conlisk, San Francisco, and W. M. Rank and C. H. Lind, Alameda.

***Lula-Homer Railway, Lula, Ga.**—Application for a charter has been made by this company to build a 15-mile interurban railway from Lula to Homer. Headquarters: Lula. Capital stock, $200,000. Incorporators: S. A. Carter, W. A. Boling, B. E. Chapman, Joel Coffee and E. F. Whitworth, Lula; C. H. Chambers and E. A. Mize, Homer.

FRANCHISES

Gadsden, Ala.—Plans have been worked out for the preliminary survey for the proposed electric railway from Gadsden to Centre through a part of Cherokee County. It is planned to build a bridge across the Coosa River and extend the line to East Gadsden.

Calgary, Alta.—The Chestermere & Calgary Suburban Railroad has asked the Council for an extension of time on its franchise in which to build its projected electric railway from Calgary to Chestermere Lake, Alta. Griffiths, Ford, Wright & Miller, Calgary, solicitors.

Benecia, Cal.—The Benecia Land & Terminal Company has asked the Council for a franchise to the city limits on the Vallejo Road in Benecia. A franchise in Vallejo will be applied for at an early date of the City Council, and the Supervisors at their next meeting, in October, will also be asked to grant permits over certain county roads. This is part of a plan to build an electric line from Benecia to Vallejo and a line from Benecia to Winters, via the Berryessa Valley. [E. R. J., Aug. 22, '14.]

Fresno, Cal.—The Fresno Interurban Railway has asked the Council for a franchise to extend its line out Fresno Avenue to Mahoney, thence to Blackstone, north to Weldon and out that street to the Normal school, a distance of 1½ miles. As soon as the line to the school is completed, work will begin on the unit to Clovis from Alvina Heights.

Los Angeles, Cal.—The Pacific Electric Railway has received a twenty-one-year franchise from the Council over certain sections of Sixth Street and Central Avenue in Los Angeles.

San Francisco, Cal.—Members of the North Beach Promotion Association have asked the Board of Supervisors to authorize the San Francisco Municipal Railway to extend its line down Stockton Street to the Embarcadero.

Stockton, Cal.—The Tidewater Southern Railway has asked the Council for a franchise to extend its tracks in Stockton to connect its warehouses, manufactories and other industries and enterprises within its line of railway and for the purpose of connecting its line with the tracks of other railroad companies in Stockton.

Franklin, Mass.—The Milford, Attleboro & Woonsocket Street Railway has asked the Council for a franchise to relocate its tracks on Central Street in Franklin.

Swampscott, Mass.—The Bay State Street Railway has received permission from the Council to double track Humphrey Street from the Lynn line to Commonwealth Avenue in Swampscott.

***Ypsilanti, Mich.**—The Ypsilanti Street Railway has asked the Council for a franchise to build an electric belt line in Ypsilanti and to arrange to use the tracks of the Detroit, Jackson & Chicago Railway on Michigan Avenue, Washington, and West Cross Streets in Ypsilanti. Frederick H. Zeigen, Detroit, president.

TRACK AND ROADWAY

Edmonton (Alta.) Radial Railway.—Arrangements have been made by this company with the Hudson's Bay Company to have the work of paving and laying tracks for the line on Portage Avenue begun at once.

Pacific Electric Railway, Los Angeles, Cal.—Right-of-way has been secured by this company from Riverside to Corona via Yorba Linda, Brea and Whittier. The Harbor Commission has requested this company to remove certain tracks crossing the northern end of Municipal Dock No. 1 and serving the Miner fill and docks of the Outer Harbor Dock & Wharf Company. In the event of the removal of these tracks the Miner fill people will be expected to construct tracks on their own property up to the adjoining city lands.

Marin County Electric Railway, Mill Valley, Cal.—The Railroad Commission has issued an order granting this company an extension of time until April 1, 1915, in which to sell the stock previously authorized for the construction of an electric railway in Mill Valley, Marin County. W. Wesley Hicks, 320 Market Street, San Francisco, chief engineer. [E. R. J., June 13, '14.]

***Redlands, Cal.**—Plans are being considered to build an electric railway from Redlands Junction to Yucaipa via Redlands. G. S. Biggin and E. A. Warner are among those interested.

Stockton (Cal.) Electric Railway.—All legal preliminaries having been completed actual construction of the extension of the El Dorado Street line of this railway to Tuxedo Park will begin within the next few days.

Danbury & Bethel Street Railway, Danbury, Conn.—The Public Utilities Commission has approved the plan of this company for the reconstruction of its track on White Street, Danbury, and the construction of a turnout at that place.

Washington Railway & Electric Railway, Washington, D. C.—By unanimous consent the House has passed a Senate bill authorizing this company to extend its tracks from the point where its present tracks intersect Portland Street Southeast, thence along Portland Street in a westerly direction to Fourth Street Southwest in Washington, D. C.

St. Petersburg & Gulf Railway, St. Petersburg, Fla.—The extension of this railway on Ninth Street north and eastward on the Johns Pass Road half way to Coffee Pot Bayou is completed and will soon be placed in operation. This extension is the first part of a loop that will be completed eventually to connect the former North Street terminus and the Coffee Pot terminus.

St. Elmo, Springfield & Northern Traction Company, Springfield, Ill.—This company, incorporated in 1907 for the purpose of building an electric railway from St. Elmo to Springfield, Ill., has filed notice of dissolution with the State Public Utilities Commission.

***East Dubuque, Ill.**—Plans are being made to form a company to build an electric railway to connect Platteville with Lancaster, the county seat of Grant County, the inland villages west and north, and also to connect with the Chicago, Milwaukee & St. Paul Railroad and the Chicago, Northwestern Railroad at Shullsburg, the Illinois Central Railroad at Apple River, Ill., the Chicago, Great Western Railroad at Stockton and the several lines at Freeport, where connections will be made with the Illinois Traction System, thus giving Grant County a direct route with Chicago. This is not a new railway project, it having been in process of promotion for several years by Engineer Palmer, who has been working on the proposition ever since the Fox line to Platteville was abandoned.

Tri-City Railway, Davenport, Ia.—The new line on Thirty-eighth Street from Eighteenth Avenue to Seventh Avenue connecting with the Fourth Avenue line in Rock Island has been placed in operation by this company.

Manhattan City & Interurban Railway, Manhattan, Kan.—It is reported that this company will operate its cars into Junction City over its own tracks and that work on the addition to the line to Fort Riley into Junction City will be begun at once. The managements of the Manhattan and Junction City companies were unable to come to an agreement for the use of the Junction City to Fort Riley electric line.

New Orleans Railway & Light Company, New Orleans, La.—Elaborate improvements will soon be made by this company on its property along the New Basin Canal at West End to facilitate the landing of passengers for the city's West End Park, which is to be opened next spring. The company will remove the old bridge and in its stead will erect a new passenger bridge, 250 ft. nearer the lake than the old one. This structure will cost about $45,000. The whole improvements, including the bridge, will cost $65,000 or $70,000.

Quebec Extension Railway, Presque Isle, Maine.—Surveys have been completed and plans are being made by this railway to begin construction in 1915 for its 100-mile line between Washburn and Quebec. It will extend across the northern part of Maine to connect the existing lines at Quebec and New Brunswick, and across New Brunswick to the Quebec border. [E. R. J., Aug. 15, '14.]

Wahpeton-Breckenridge Street Railway, Breckenridge, Minn.—Work has been begun by this company tearing down the old wooden poles along its lines and replacing them with new steel posts.

St. John (N. B.) Railway.—This company is asked to consider plans to extend its lines through Simonds, St. John County.

Frontier Electric Railway, Niagara Falls, N. Y.—If the necessary franchises are obtained from the Councils of Tonawanda and North Tonawanda this fall this company will begin work on the line which plans to parallel the International Railway's new line which will enter Niagara Falls over a private right-of-way paralleling the Erie Railroad. It will extend over the private property to Portage Road and along Portage Road to Niagara Street, where it will connect with the present Niagara Street line.

Durham, N. C.—Preliminary arrangements are being made to organize a company to build the 12-mile electric line between Durham and Chapel Hill. C. G. Creighton, Durham, is interested. [E. R. J., March 14, '14.]

Cleveland (Ohio) Railway.—This company is asked to consider plans to extend its Madison Avenue line from its present terminus at West 117th Street to Rocky River in Cleveland.

Columbus, Delaware & Marion Railroad, Columbus, Ohio.—The city of Columbus has granted this company the right to use T-rails on Hudson Street and Indianola Avenue. The improvement had been delayed because of the franchise provision demanding the use of grooved rails. Residents of the vicinity petitioned the City Council to allow the company to use T-rails on condition that the work be completed this fall.

Dayton, Middletown, Reading & Cincinnati Company, Middletown, Ohio.—If the property can be secured, it is possible that this company will use the Miami & Erie canal bed for its right-of-way. The plan, however, is yet unmatured. The engineers are at work on Reading Road, the original route contemplated, and the officers state that they are in no hurry to begin actual construction and would prefer to wait until the European war is over to finance the proposition. This will give time to consider the use of the canal bed. [E. R. J., June 13, '14.]

Hocking-Sunday Creek Traction Company, Nelsonville, Ohio.—It is reported that Close Brothers, of London, England, will furnish $100,000 for the completion of this line between Nelsonville and Athens. This firm is building a large central station in the coal field at Floodwood, which will be near the new traction line. It will furnish power and light to a number of towns in the Hocking and Sunday Creek valleys and in other sections of the State.

Sudbury-Copper Cliff Suburban Electric Railway, Sudbury, Ont.—This company, which plans to build an electric railway from Sudbury westerly to Copper Cliff and from Sudbury easterly to Coneston, has elected the following officers: J. J. Mackey, president; J. H. Morin, vice-president, and M. J. Powell, secretary. [E. R. J., July 11, '14.]

Toronto, Ont.—The series of thirty meetings organized in the various municipalities interested in the project of building an electric railway from Toronto to Markham, Port Perry, and other points, is being held, and the final meeting is being arranged for Oct. 17. The vote will be taken in the various municipalities Oct. 19. The question to be submitted to the ratepayers will be whether authority shall be given to the various Councils to raise the amounts which will make up the $3,954,914, which is the estimated cost of the building and equipment of the 77½ miles of proposed railway. [E. R. J., Oct. 3, '14.]

Toronto & Suburban Railway, Toronto Junction, Ont.—The Toronto-Woodbridge extension of this company's lines, which has been under construction for nearly two years, is nearing completion, and it is expected will be in operation in October. An hourly service will be inaugurated to Woodbridge with a fifteen-minute schedule to Weston.

Uxbridge, Ont.—A by-law to raise $202,665 for the construction of an electric railway in Uxbridge will be submitted and voted on, Oct. 19, by the ratepayers in Uxbridge.

***Waterford, Ont.**—The Hydro-Electric Power Commission of Ontario is contemplating the construction of an electric line from Brantford to Waterford via Burford, Scolland and Oakland. It is the intention to build a substation in Waterford this winter. W. W. Pope, Continental Life Building, Toronto, secretary. F. A. Gaby, engineer.

Berks & Lancaster Railway, Lancaster, Pa.—Work has been begun by this company on its line which will extend from Lititz to Womelsdorf and from Clay to Kleinfeltersville. V. J. McGlesney, Phoenixville, is interested. [E. R. J., June 27, '14.]

Conestoga Traction Company, Lancaster, Pa.—A 3-mile extension from Marietta to Maytown is being planned by this company.

Philadelphia (Pa.) Rapid Transit Company.—This company is asked to consider plans to build an extension on Fifty-sixth Street in Philadelphia.

Nashville (Tenn.) Traction Company.—Track laying for this railway has been begun on additional streets by the Detroit & Nashville Traction Company, organized to do the construction work. Tracks have been laid on the Shelby Avenue line, and it is announced that rails will be laid on the McGavock Avenue bridge in the next two or three weeks. The tracks have been completed on Fifth Avenue from Crawford Street to Mulberry Street and on Lafayette from Second Avenue to the city limits, and it is expected that cars will begin to operate the latter part of November. [E. R. J., Sept. 5, '14.]

***West Virginia Electric Company, Owensport, W. Va.**—This company is being organized to build a 50-mile electric railway from Owensport to Weston, W. Va.

SHOPS AND BUILDINGS

Pacific Electric Railway, Los Angeles, Cal.—Plans are being made by this company to begin work soon on the construction of its new depot in Gardena.

Moncton Tramways, Electricity & Gas Company, Ltd., Moncton, N. B.—This company's carhouse at Moncton was destroyed by fire on Sept. 14. The loss is estimated to be about $10,000. Plans are being made to rebuild at once.

Portsmouth Street Railroad & Light Company, Portsmouth, Ohio.—Plans are being considered by this company to build a large modern carhouse in Portsmouth in the spring.

Salt Lake & Ogden Electric Railway, Salt Lake City, Utah.—Plans are being considered by this company and the Ogden Rapid Transit Company to build soon a joint interurban terminal on Twenty-fourth Street between Grant Avenue and Lincoln Avenue in Ogden. The structure will be two stories high with a frontage of 50 ft. on Twenty-fourth Street and will extend 270 ft. from Twenty-fourth Street north into the center of the block. Entrance to the terminal by the cars of both companies will be from Lincoln Avenue.

Southern Traction Company, Dallas, Tex.—This company has opened a new passenger station at Alma. Its new brick depots at Palmer, Milford and Forreston are nearing completion.

POWER HOUSES AND SUBSTATIONS

Milwaukee Electric Railway & Light Company, Milwaukee, Wis.—This company will add to the equipment of the West Allis substation two 5000-kva water-cooled transformers, switches, current transformers and accessories. The contract for the apparatus has been placed with the General Electric Company.

Manufactures and Supplies

ROLLING STOCK

Charleston (S. C.) Consolidated Railway & Lighting Company is reported to have purchased twelve all-steel city cars from the Cincinnati Car Company.

TRADE NOTES

Walter B. Snow, Boston, publicity engineer, has removed his offices to Rooms 511-516, in the new Federal Street Building, 136 Federal Street.

C. W. Lee Company, New York, has moved its offices from 90 West Street to 56 Pine Street. C. W. Lee, the active head of the concern, has handled many important public utilities during the past ten years.

D. M. Donnan of the Boston sales office of the Westinghouse Electric & Manufacturing Company, has resigned, effective Oct. 1, 1914, to become the manager of the Electrical Engineering & Manufacturing Company, with offices in the First National Bank Building, Pittsburgh, which will represent the Morgan Crucible Company, Ltd., in the Pittsburgh district for the sale of Morganite and Battersea carbon brushes. Mr. Donnan before he went to Boston was connected for a number of years with the New York and East Pittsburgh offices of the Westinghouse Electric & Manufacturing Company.

A. M. Byers, Pittsburgh, Pa., has recently completed a new galvanized plant at its mills in Pittsburgh which contains modern equipment for manipulating its wrought-iron pipe galvanizing process. The Byers galvanizing specifications call for a hot metal process, a coating of high-grade prime Western spelter, and a deposit 100 per cent heavier than that required in government galvanizing specifications. A careful weighing and inspection before galvanizing; the device for turning the pipe in the baths; the extra long cleansing period; the pyrometer regulated kettles; the superior quality and absolute purity of the spelter, and the final weighing that assures the proper coating—each of these steps are specialized and handled by experts. The spelter bites down deeply into the porous uniform texture of the wrought-iron pipe, coating it thickly and evenly, thus minimizing possibility of flaking.

Esterline Company, Indianapolis, Ind., reports the shipment of "Golden Glow" headlights to the following electric railways in the month of September: Texas Traction Company, Dallas, Tex.; Standard Steel Car Company for cars being built for the Mahoning & Shenango Railway & Light Company; Lynchburg (Va.) Traction & Light Company, Muskegon (Mich.) Traction & Lighting Company; Georgia Railway & Power Company, Atlanta, Ga.; Roanoke (Va.) Railway & Electric Company; Pacific Gas & Electric Company, Sacramento, Cal.; Meridian (Miss.) Light & Railway Company; Corry & Columbus Street Railway, Corry, Pa.; Tidewater Power Company, Wilmington, N. C.; Memphis (Tenn.) Street Railway; Jewett Car Company for cars being built for the Geary Street Municipal Railway, San Francisco, Cal.; Lincoln (Ill.) Railway & Light Company; Seattle Car & Foundry Company, Seattle, Wash.; Virginia Railway & Power Company, Norfolk, Va., and Cleveland & Eastern Traction Company, Cleveland, Ohio.

ADVERTISING LITERATURE

American Electrical Works, Phillipsdale, R. I., has issued a price list, effective Sept. 24, of its wire and cable materials.

Prepayment Car Sales Company, New York, has issued an advertising card in regard to its booth at the A. E. R. A. Convention.

Monarch Pneumatic Tool Company, St. Louis, Mo., has issued Bulletin 18-A, describing its various types of pneumatic tools.

Arnold Company, Chicago, engineers, have issued a postcard photograph of the new car shops of the Chicago & Eastern Illinois Railroad at Danville, Ill.

Railway & Industrial Engineering Company, Pittsburgh, Pa., has issued a booklet which contains a discussion, accompanied by diagrams, showing the advantages of raising the voltage for d.c. distribution for electric railways.

St. Louis Car Company, St. Louis, Mo., has issued a folder describing the Thompson slack adjuster; lined and unlined rattan for seating; longitudinal cushions and backs, upholstered in rattan, leather, carpet and plush and vertical wheel brakes.

Van Dorn & Dutton Company, Cleveland, Ohio, has distributed among its friends and patrons in the traction field an attractive and instructive wall hanger. In halftone illustrations this shows the evolution that has taken place in cars for street and interurban railway transportation service. It also contains a message on gears and pinions and a short story on economical operation.

Harrison Safety Boiler Works, Philadelphia, has issued a folder describing its Cochrane metering heater, precision meter, multiport safety exhaust outlet valve, flow valve, steam-stack and cut-out valve heater and receiver, separator and Sorge-Cochrane hot-process, water-softening system for steam-power plants. A diagram in the folder indicates the location of this company's exhibit at the A. E. R. A. convention.

Sprague Electric Works of General Electric Company, New York, has issued Bulletin No. 48,700 describing its electric monorail cranes for efficiency in modern industrial plants. The catalog contains a complete description of these cranes and shows many illustrations of actual installations. This bulletin is supplemented by a small folder describing electric hoists for the efficient handling of all loads. Bulletin No. 48,701, which supersedes Bulletin No. 112, describes in detail electric dynamometers for measuring horse-power, generated or absorbed. Actual values of torque and speed can be measured at any loads and speeds within the range of the machine under test.

Union Electric Company, Pittsburgh, Pa., has issued a bulletin descriptive of the Melobeam headlight, the latest development made by the Crouse-Hinds Company in incandescent headlights for either surface or flush mounting. The flush type is the same size as the Crouse-Hinds type "Z" and is therefore interchangeable. It may be equipped with either clear or Noglare doublet lens and will accommodate any concentrated filament mazda lamps from 23 to 94 watts by merely adjusting the receptacle in the case. Lamps are mounted in a vertical position, insuring the longest possible life. The lamps are intended to be burned in the headlight in series with the car lighting circuit usings lamps of the same wattage and voltage as those burned in the car. However, in cases where a larger lamp is desired in the headlight than those used in the car, a special resistance can be furnished in the headlight, making it possible to use larger lamps independent of the car-lighting circuit. This company has also issued a folder on Keystone porcelain strain insulators, guy wire type, for requirements of high insulation and great mechanical strength.

Railway Appliances Company, Chicago, has issued an attractive catalog describing the Ray snow flanger, important changes in which have been made in its lifting mechanism which make it automatic in action. In the improved design the flanger is forced to the lowered position under air pressure, and as soon as the engineer or engineman release the air the auxiliary springs automatically and quickly raise the flanger to the uppermost position, where it remains until the air pressure is again applied. An illustration in the catalog shows a flanger attached to the body of a General Electric locomotive. Other illustrations show an application of the flanger to an interurban car of the Davenport & Muscatine Railway, Davenport, Ia. Flangers can be either mounted on the truck or to the car body. Flanging blades can be made to take a considerable depth of snow and thus eliminate to a large extent the use of wedge plows and other heavy snow-fighting equipment. The whole mechanism is so designed that it will clear bridges and guard rails, and cars can be run over city pavements, as the flanging blades do not extend below the head of the rail. In a special design adapted for third-rail lines the blades are so arranged that the snow at all times is thrown to one side of the right-of-way and away from the third-rail. When flangers are required for light interurban service the application may be made directly upon the truck. In this position it is possible to neck the cutter knives, allowing the flanger blades to project below the ball of the rail, thus effecting a clean flangeway and full tractive effort.

Electric Railway Journal

DAILY EDITION

Published at the Annual Conventions of the American Electric Railway Association and Its Affiliated Associations

Copyright, 1914, by McGraw Publishing Company, Inc.

Vol. XLIV NEW YORK—TUESDAY, OCTOBER 13, 1914—ATLANTIC CITY NO. 15A

PROGRAM FOR TO-DAY

CONVENTION MEETINGS

9:00 a.m.	Meeting of the Transportation & Traffic Association, Greek Temple, Convention Pier.
9:30 a.m.	Joint Session of Engineering Association with Claims and Transportation & Traffic Associations, Greek Temple, Convention Pier.
9:30 a.m.	Opening meeting of Accountants' Association, Accountants' Hall, Second Floor of Convention Pier
11:00 a.m.	Session of Claims Association, Claims Hall, Convention Pier.
11:00 a.m.	Joint Session of Engineering Association with Transportation & Traffic Association, Greek Temple, Convention Pier.
2:00 p.m.	Opening meeting of American Association, Greek Temple, Convention Pier.

ENTERTAINMENT

10:00 a.m.	Obstacle Golf, Marlborough-Blenheim Lawn.
11:00 a.m.	Concert by Engel's Orchestra, Lobby, Convention Pier.
11:00 a.m.	Trapshooting Practice, End of Convention Pier.
3:00 p.m.	Ladies' Cards, Parisian Garden. Convention Pier.
4:00 p.m.	Obstacle Golf. Marlborough-Blenheim Lawn.
9:00 p.m.	Informal Dancing, Ball Room, Convention Pier.

The Opening of the Convention

The association is again fortunate in weather conditions for its annual convention. Atlantic City can do no better, and while the pier is well protected against rain, the kind treatment afforded by the weather bureau this year, at least so far, during convention week has certainly been appreciated. The exhibits show no sign, either in number or quality, of any financial stringency, and in point of individual and collective interest, are equal, if not superior, to those of preceding conventions. It is yet too early to say much that is definite in regard to the number of attendants. According to the secretary's office the advance registration was as large as usual, namely about 700, and as the sessions of the American and Accountants' Associations do not begin until to-day it is hard to tell how many others will arrive until this afternoon. This year's arrangements for both the exhibits and the technical sessions are exceptional and there is every reason to expect as successful a convention as any of previous years.

The Association and the Colleges

We do not usually think of the American Electric Railway Association as closely related to the colleges, and it is true that the relation has not been as close as it can be made. It would be an excellent plan for the railway association to co-operate with the National Electric Light Association in the effort which is being made to bring the industry and the schools closer together. It is understood that a much larger number of teachers than usual will attend the Atlantic City convention at the suggestion of the association. If they receive a hearty welcome they will want to come again. Let some of our good "mixers" show the newcomers that the practical man is in sympathy with the efforts of the teacher.

Standard Codes Now in Permanent Form

With the report of the committee on rules which was presented yesterday, the standard codes for city and interurban service have at last taken practically permanent form. The fact that during the last five years both codes have been made subject to extended annual changes has militated against their general adoption, but now that they have reached the point where the probability of further extended revisions is exceedingly slight there exists no longer any reason why they should not be accepted in toto by every electric railway in the country. Such minor changes as may be made from time to time in future may easily be included by the insertion of printed slips. Indeed, it is to be hoped that this procedure will be followed promptly by all those now using the city code in connection with the revision of rule 55 which was approved at yesterday's meeting, and which was the only change in the city code. The rule, as it stood before revision, was opposed by a number of well-known railway companies upon the plea that it gave offense to passengers, and we are glad that a greater latitude has been permitted in the information which employees are permitted to give out to patrons.

The Exhibits

It is not difficult for the experienced observer of the annual exhibits of the American Electric Railway Manufacturers' Association to see how the latest problems of the industry are reflected in the elaborate displays of specific groups of apparatus. This year the signal manufacturers deserve to be pointed out for exceptionally good work. Not only have they made many improvements in their apparatus during the past year, but they have also demonstrated that a signal system can be used for other purposes than elimination of accidents. Thus one type has lately been set up temporarily to replace flagmen on construction jobs, while another has accelerated traffic by eliminating train orders. It is also complimentary to the work of the American Electric Railway Engineering Association that several of the manufacturers are announcing their adoption of the standard A. E. R. A. aspects. The signal exhibits find a close second in the variety and ingenuity of fare-recording apparatus. In this line the latest developments have been in the direction of quicker transfer distribution and combination fare boxes for coins, metal tokens and tickets. Thus, while the prepayment method has long been an accomplished fact, there is still much room for apparatus which will enable one conductor to handle more readily the two hard conditions peculiar to American electric railway operation—the long big-capacity city car and the rush hour. Closely related to the fare-recording devices are some marvelous machines which sort, count and bag all the coin that an electric railway may be fortunate enough to collect.

The apparatus maintenance end of the electric railway business is represented this year by an extraordinary development of welding systems which are doing wonders to prolong the life of special work and to simplify the work of the trackmen in the installation of welded joints, while the handy portable welders now available for car shop use should cut down the scrap pile to still smaller proportions. It is almost needless to point out the numerous betterments in car equipment. The truckless car and the radial axle truck have taken another step forward in aiding the production of light-weight cars of "double-truck" length. The ventilated motor, lighter contactor control, voltage regulators for car lighting, headlights and heaters are among the electrical features which are still making advances toward greater economy and usefulness. The varieties in ventilators, the increased use of glazed sanitary fittings and the advent of illuminated route number signs in place of the exasperating block destination indicator are among the changes that show how the immediate comfort of the public is being looked after by the electric railway operator.

Conventionalities

Go to Abrahams and get fitted for a coat.

"Break we our watch up." Al "Shakespeare" Green.

Archbold, of Archbold-Brady, is piering about as arch and bold as ever.

Phoney Films No. 27: Beau Brummel McConnaughy in a straw hat on Oct. 12.

On the committee on taxation matters—W. F. Ham and F. W. Bacon. There's a team!

On Sunday Mr. and Mrs. S. S. Crane arrived from Altoona. Altoona's loss is a big gain for us!

The committee on entertainments has requested that all delegates and guests wear their badges at all times.

Champions may come and champions may go, but Pop Wilkinson still remains commander-in-chief of the roller chair brigade.

The Palmer family, so ably represented by G. W. and L. H., is long on convention honors, holding chairmanships in two committees.

J. S. Speer denies that his brushes are used for dusting clothes. He says they are intended for removing currants from electric plants.

An epigram sent in by the conductors of the Indiana Union Traction: "Take care of your Nicholls and the inspectors won't get you."

Have you seen Tom Casey's Million Dollar Pier on the Million Dollar Idea? Or is it the Million Dollar Idea on the Million Dollar Pier?

No, Clarisse, the name of the white-haired gentleman at the front door is not Paul Dohrman nor does he come from the Detroit United Railways.

At 3:20 p. m. Monday we lamped presidentissimo C. N. Black at the illuminated scoreboard of the Braves-White Elephants. Fans, fancy that!

Well, anyway, T. D. B. Griffin says that it's good practice to operate without train orders. If you'll go 'round to the booth he'll prove it with his little model.

J. P. Barnes of the Syracuse Interurban is reputed to be a singer but we don't believe it. Where is the mop of hair which invariably accompanies musical talent?

W. C. Callaghan, who resides in the shadow of the historic Last Chance Gulch, is inviting all of his old friends to go to Helena with him after the convention.

Nate Garland and Tom Mullaney got inside the money at the Engineers' Club golf tournament last week, the latter taking thirty-one putts on the second. Some golf!

No formal golf tournament is planned for this convention, but the usual arrangements have been made with the Atlantic City Country Club for those desiring to play.

Mr. and Mrs. George A. Barnes stopped at our booth on Sunday but not long enough so that all of us had a chance to meet the delightful Mrs. Barnes. Please come in again.

E. S. Fassett and his green velour hat are welcome visitors. The hat is bright green. Mr. Fassett is also bright (no, not green) from head to foot.

We were more than flattered on Sunday to learn that Mrs. H. M. Sperry is a constant reader of the Electric Railway Journal. It is indeed delightful to have secured the interest of so charming a scientist.

The kindly smile and keen gray eyes of our Engineering president, J. H. Hanna, illuminated the Boardwalk on Sunday, so we knew in advance that yesterday would mark the beginning of the best convention ever held.

H. G. Stott and Mrs. Stott, together with their son and daughter were among the very early arrivals on Saturday. Mr. Stott is responsible for the delivery of more power to electric railways than any other man in the world.

Newton W. Bolen, the banquet king of New Jersey, is snuffing the salt sea air like a Patagonian stallion to get up an appetite worthy of the next series of testimonial dinners given to him by his employees. We love you, too, Newt!

Be sure to try your skill at skee-ball at the Aquarium Court. It's the latest craze. Play as often as you like, but come early so everyone will have a chance. Prizes will be awarded to ladies and gentlemen who make the highest score.

Direct evidence as to the real value of the convention: B. J. Denman, assistant general manager of the United Light & Railways Company, has come here to investigate and get suggestions on several problems that have come before him recently.

When Messrs. Hackett and Renshaw, who are attending their first electric railway convention and who were introduced by Joe Renton to the industry via the Brighton punch route, they complained about the rocky road. These Federals aren't up to big league stuff yet.

Handsome Joe Alexander, chief engineer of the Cleveland Street Railway Commission, is having a hard time walking alone on the Boardwalk; commissioner Pete Marktwain Witt having been compelled to remain in Cleveland to explain the single tax to J. J. Stanley.

Having organized his work down to the finest detail, Secretary Burritt is now enjoying life. Yesterday, before breakfast, we saw him racing on horseback with Harlow Clark. He won by a length because his horse was sharper in front than the editor's and offered less resistance to the wind.

The genius which inspired the Bulletin Board placed on the ramp at the entrance to the Convention Pier certainly is entitled to credit for the position and prominence of it. Here every day will appear the entertainment provided that day for the members and guests and any special notices or added features that have presented themselves.

No more sailing. Yo! Ho! Nor a bottle of rum. No! For Dan Smith's good ship Virginia which has carried many a good railway friend on a pirates raid, now rests on the bottom of the Detroit River. On her last eventful voyage it is whispered that George Radcliffe of Cleveland and Frank Coates of Toledo played prominent parts.

H. H. Adams, the guy who stopped the holes in the sieve of receivership on the old Metropolitan, arrived on Sunday. He is now chairman of the committee on standards and, in addition to his other manifold duties, is also a member of another committee which has some important work to do at this convention. Ask him what that little book in his pocket is for—Martin Schreiber has one just like it, and so have several others.

General Manager Mutt and Little Jeff, the master mechanic, became separated yesterday from their genial friend and mentor, Miles Lambert, the prominent Irish engineer. "Jeff," remarked the general manager, "where is good old Lamb?" "Boss," replied Jeff, "You'll find him in the Shelburne grill, matching pennies with Miss LeGould." "This is the life," returned the general manager. "Let us join the game. We can see those pressed-steel motors when we get back home."

The convention opened yesterday morning with a good-sized attendance amid an outburst of patriotic music and colored lights in the foyer. F. Pincus presented Engel and his orchestra, which played "A Day at West Point," a blending of the famous music of the North and the South. The delegates remained standing while the strains of the Star-Spangled Banner were played, and the American flag, outlined in electric lights overhead, flashed its message of success to the 1914 convention.

CORNELL A. E. R. A. REUNION

Following the precedent establishment last year Cornell men of all classes '69 to '14 will gather for lunch at the Marlborough-Blenheim at or about 12:30 o'clock on Thursday. Men are requested to register promptly for the lunch at the Manufacturers' Association desk with Wylie Brown or W. L. Wright.

THE ST. LOUIS TRAIN

Fifty-five railway and supply men from St. Louis and the southwest, and a few ladies, arrived at Atlantic City at 3 p. m. Sunday. Elaborate preparations were made for a special train, but at the last minute it was found that quicker time could be made if special cars were attached to one of the regular fast trains going east. As a result of this decision the four special all-steel cars were set in with the regular seven-car train of the Pennsylvania's "New Yorker," which is a 24-hour train from St. Louis to New York City. At Harrisburg the four cars were made up and came through as a special train. In this way the conventionites reached here two hours earlier than would have been possible under the original plan.

The trip from St. Louis was made without unusual incident, and aside from the fact that some of the regular patrons of the "New Yorker" persisted in referring to the electric railway men as electricians no one would have known but that the train was a convention special. Several delegates picked up at Indiana and Ohio points came through on the train.

LADIES' AUCTION BRIDGE TOURNAMENT

The Parisian Garden has been especially provided for the afternoon card games, concerts and thé dansants. The ladies who intend to participate in the card games this afternoon are asked to be present for play promptly at 3 p. m., Oct. 13. The finals will be played to-morrow at the same place and same hour.

The prizes to be awarded for the winners of the contests are quite up to the standard set in past years, and will be given to the highest two teams or pairs of the fourth round. Full information in regard to the conditions of the games are published on page 20 of the entertainment program.

TRAP SHOOTING

All those who have brought guns are probably keen for the sport awaiting them on the end of the convention pier this morning at 11 o'clock, when the clay pigeons commence to fly over the waters of the Atlantic. Competition is open to wearers of the official badge, and the committee is hoping that this contest will bring out the lady shots of the convention. Practice shooting will be held on Tuesday from 11 a. m. to 1:30 p. m. and on Wednesday from 8 a. m. to 9:30 a. m. This promises to be an annual event. The tournament shoot will start Wednesday at 2 p. m., and there will be three contests, namely, for novices, supply men and railway men.

A professional trap shot will supervise the shooting and give instruction and advice. Guns and ammunition are provided to those that did not bring their own.

GETS 'EM GOING AND COMING!

We have heard of pay-as-you-enter cars and also of pay-as-you-leave cars, but P. N. Jones, of Pittsburgh, expects to put in operation a pay-as-you-enter, pay-as-you-leave car. Three-quarters of the space in this car will be run on the pay-as-you-enter principle and the other quarter on the pay-as-you-leave principle. This is the plan which will be applied to Mr. Jones' double-deck cars, which have been described in this paper, and beginning on Friday of this week the full service on the Fifth and Highland route in Pittsburgh will be furnished by these cars.

In these cars the entrance and exit are widely separated, and there are separate staircases leading to and from the upper deck. The conductor is placed between these stairways so that all of the passengers who use the upper deck and the passengers at one end of the car who use the lower deck have to pass him. These are the passengers who pay as they enter. The passengers in the rear lower deck are near the entrance door and pass the conductor only when they leave the car. These are the pay-as-you-leave patrons.

The idea is a novel one and Mr. Jones is curious to know how it will work out but is sanguine of the result. He has issued a folder to explain the system and has asked the cooperation of the public in making a success of this type of car.

YESTERDAY'S TEA DANCE

The afternoon concert and thé dansant, given in the Parisian Garden at 3 p. m. yesterday afternoon, made an instantaneous hit, and this feature will be continued up to and including Thursday. The setting followed yesterday in the foyer was very attractive, and the graceful tables, chairs and summery awnings bore a striking resemblance to those to be found on the boulevards of Paris and in the Champs d'Elysée and which are ever popular with the French crowds. The general effect fully justified the name of the Parisian Garden, selected by the entertainment committee.

THE CHICAGO SPECIAL TRAIN

There was a lot of fun and a fine crowd of jolly people, nearly 100 in number, on the Chicago Convention Special. This train ran from Chicago to Atlantic City over the Pennsylvania lines in less than twenty-two hours. The equipment was the counterpart of the Broadway limited. Friend Bixby, of the Chicago office of the Pennsylvania line, started the party eastward and mingled with the crowd until a doubtfully late hour. Some claim he detrained at Warsaw and others at Lima. At any rate he had the thanks of the crowd. This year's Chicago convention train brought a larger proportion of railway men than ever before.

This paragraph is about the ladies. There were twelve charming ones on the train, and it should be said that "a pleasant time was had by all." Most of the ladies played cards Saturday evening and watched the scenery Sunday. Through the courtesy of H. E. Chubbuck, vice-president executive, Illinois Traction System, packs of playing cards were distributed. There were several gentlemen, we desire to record, who brought their own cards, and one who brought some rattley things in a little black grip. Five gentlemen passed these little things back and forth until nearly morning, when one man had most of them.

Under the guidance of E. H. Noyes, whose middle name is Aluminum, a pool was organized, collected, posted, won and distributed. It was arranged to give three prizes to those who came nearest to having the time at which the observation platform passed the Pennsylvania shore abutment of the Delaware River bridge. Before announcing the winners, let us say that this was a contest of luck, not guessing ability. Now the winners were: Harry Monroe, General Electric Company, or Mrs. Monroe, for first prize. Certain people say Harry kept the money and others say they saw him give it to his wife. The second prize was drawn by No. 13, Eugene Soules, manager publicity department Illinois Traction System, and the third prize went to John F. Decker, general manager Auto Utilities Manufacturing Company, Chicago.

On the arrival of the train at Atlantic City at 3:39 o'clock Sunday afternoon, the Chicago contingent scattered to their various hotels and took up their individual parts of the busy convention life.

THE WEEK'S ENTERTAINMENTS

Each year the entertainment committee, with past records to exceed, has had a harder task in presenting a new, interesting and entertaining program, but this year there need be no doubt that that ideal has been fully accomplished. Carnival night, which has been arranged for Wednesday, is the exceptionally novel offering of this year, and regarding it the committee states euphoniously that surprises galore will be in store. The music, which has always been excellent, is quite up to the standard of previous years, with Engel's Orchestra playing for the concerts, as well as for the formal and informal affairs. Special attention has been given to the arrangement of the musical programs so that selections from grand opera, modern dances and the season's latest musical successes will be included.

Obstacle golf has been revived this year by special permission of the Messrs. White of the Marlborough-Blenheim, who have given the entertainment committee permission to use the entire front lawn of that hotel. An exceptional and interesting course has been laid out through the courtesy of Gimbel Brothers, of Philadelphia and New York, who assisted in its arrangement. This is a game that everyone can play, and the large crowds that have taken advantage of the opportunity to play this game in previous years suggest an early handing in of names. The bulletin board will announce the hour when the members of the committee in charge may be found on the course.

Entirely new to the convention this year will be the trapshooting contest. A number of experts have brought their own guns, and a lively and interesting event is promised. Novices are invited to join and guests will be provided with plenty of guns and ammunition. Skee-ball alleys, installed through the courtesy of J. D. Este Company, Philadelphia, have been located in the Aquarium Court, and prizes are offered for the ladies and gentlemen securing the highest number of points.

The dances, which have been so generally popular, have been arranged for Wednesday and Thursday afternoons. Alternating with the dances, tea will be served, and, in addition, an excellent concert program has been arranged. Special dancing features will be introduced at the formal promenade concert and ball which will take place on Thursday night in the ballroom of the Convention Pier.

The special privileges accorded the delegates and their guests at the convention and a program of the entertainments for the week have been published in an official program, copies of which are distributed from the registration booth.

MONDAY AFTERNOON CONCERT

The second concert presented by F. Pincus, of Philadelphia, with Engel's Symphony Orchestra in connection with the dansant Monday afternoon offered a most charming program. This included the overture "Triumphant Banner," Paull; Selection from "Faust," Gounod; Intermezzo "Eleanor," Deppen; overture "Zampa," Herold; selection from "Baron Trenck," Albini.

CARNIVAL NIGHT

It is intended that Wednesday's Carnival Night shall surpass all previous attempts at furnishing fun for the delegates and their guests. Many surprises are in store. There will be contest dances and the judges will be the audience, who will vote for their favorite dancers by ballot, insuring an absolutely popular choice. This is an opportunity for those with new steps to try them out. Kee-No dances will occur at different periods during the evening, and when the big dial is spun on the wheel of fortune, anybody may be the lucky one. It is hoped that every one will be sure to be on hand and help in the enjoyment of the evening.

FREE ROLLING CHAIRS

The rolling chairs will be available between the hours of 9 a. m. and 7 p. m., October 12 to 16 inclusive, and are free to the wearers of the official badges. A rate of 25 cents per person will be charged in the evening for direct runs from Convention Pier to hotels or from hotel to hotel. The rolling chair service is again in charge of W. H. Wilkinson, of the Pressed Steel Car Company.

THE ANNUAL RECEPTION

The annual reception opened the social activities of the convention last evening. The visiting delegates and their guests were received by President Charles N. Black, of the American Association, assisted by the officers and ladies of the affiliated associations. The receiving line formed to the left of the entrance, and the usual large number of the members and guests passed along the line. This is an opportunity that is being more and more appreciated, as an acquaintance with the heads of the various associations is bound to lend additional interest to the meetings. The reception opened with a concert by Engel's Orchestra. Promptly at 10 o'clock the officers and their ladies who had assembled in the booths around the ballroom were escorted to their position in the receiving line.

Madame Auld charmed everyone with her selections and provoked much enthusiasm and applause, responding gracefully to the audience's request for encores.

The general setting with the myriads of soft lights fused together with the handsome gowns of the ladies, presented a fairyland. Informal dancing continued until an hour consistent with the work ahead on the morrow, and all agreed that the dance program outlined for the week would share honors with the convention work.

HIGH SCORES IN SKEE-BALL CONTEST

The popularity of the skee-ball game in the Aquarium Court is shown by the fact that 1345 people played during the first day of the contest. The high scores up to 6 p. m. were as follows:

Mrs. W. E. Bryan	180	D. H. Ackerson	240
Mrs. George Allison	150	J. R. Ong	240
Mrs. C. Chamberlain	150	A. K. McCarthy	240

OBSTACLE GOLF

One of the popular diversions at the convention this year promises to be obstacle golf. One advantage of this game is that it does not require an expert knowledge of golf. Everybody can play obstacle golf, and if a person has never handled a golf club in his, or her, life, this presents an opportunity to take back a prize to show the real golfing friends at home. Judgment plays the principal part in covering this course with the smallest number of strokes, but everyone has a real chance to be a winner. The play is conducted on real grass costing $1 per blade—a privilege permitted through the courtesy of Messrs. White, of the Marlborough-Blenheim.

The competition is open to all ladies and gentlemen wearing the official badge. The only essential preliminary is for the contestant to register with the attendant, who will furnish each player with a special scorecard, balls and clubs. Attested scores are to be handed in on completion of play. The play opens on Monday at 2 p. m. and closes Thursday afternoon at 6 p. m.

Cardenas, a thriving city on the north coast in Matanzas Province, Cuba, expects work on its trolley to begin soon. The sale of the concession was effected recently. The cars will accommodate thirty-two passengers, and will run by storage batteries. There will be five branches traversing various parts of the city.

YESTERDAY'S SESSION OF THE TRANSPORTATION & TRAFFIC ASSOCIATION

The first session of the Transportation & Traffic Association was held yesterday afternoon at the Greek Temple. Vice-President Brush called the meeting to order at 2:15. The first order of business was the presentation of the annual address of President Hegarty. This is published elsewhere in this issue.

Vice-President Brush then referred to the fact that on the resignation of Mr. Hegarty the executive committee of the association had appointed the first vice-president of the association acting president to serve out the time. An address from him was unnecessary and superfluous, but he would simply say that on March 1, 1914, he had followed the wishes of the executive committee, and it had been a pleasure for him to carry out so far as he could the work planned by Mr. Hegarty. He said it was extremely unfortunate for the association that Mr. Hegarty had found it necessary to resign and equally unfortunate that he was not able to be present at the convention.

Secretary Burritt then read the report of the executive committee which consisted of minutes of the meetings of the executive committee. The report was approved.

Secretary Burritt then presented the report of the secretary-treasurer. This was also approved.

Vice-President Brush then appointed the committee on resolutions consisting of Charles F. Hewitt, C. Loomis Allen and C. B. Buchanan.

Vice-President Nicholl then took the chair and appointed the following committee on nominations: J. N. Shannahan, H. C. Donecker and J. V. Sullivan.

REPORT OF COMMITTEE ON RULES.

L. H. Palmer then presented the report of the committee on rules and suggested that the changes recommended by the committee be considered rule by rule. He then referred to rule No. 55 in the City code which read "Motormen or conductors must not under any circumstances give any information whatever concerning any accident, delay, blockade, mishap to any person except to a properly authorized representative of the company." The committee recommended the following substitute: "Motormen or conductors may when necessary, however, advise passengers as to the general cause and probable duration of a blockade."

The committee strongly urged that this change should be made. The motion was seconded and carried.

Mr. Palmer then passed to the interurban code. Consideration of this code began with a general discussion as to how far it was desirable to change the diction of the old rules at the present time. This discussion was carried on by Messrs. Palmer, Henry, Shannahan, Bolen, Nicholl, Ching, Van Zandt, Choate, Donecker, Storrs and Allen. It was decided finally to consider each of the changes recommended by the committee as a separate matter. This procedure resulted in the approval of practically all of the revisions suggested by the committee, the exceptions being as follows: The definitions referring to signals were retained in the code. The suggestion that markers should be carried at the top of the rear end of the train and that classification signals should be carried at the middle of the front end of the train was rejected, the old arrangement of markers and classification signals being retained. A change in present rule 159 permitting a train to proceed on its time-table rights from an initial station when unable to reach dispatcher and a suggested new rule regarding the display of signals by trains which are annulled were also rejected. The suggested change for rule 185 was approved with an amendment as made by H A. Nicholl providing for protection at all times for trains which run by and back into double-end sidings. A suggested rule also failed of approval in which the responsibility of conductors and motormen was specifically defined, it being held that both members of the train crew should be held at all times responsible for the safe operation of the train. Minor amendments were made in some cases.

At the conclusion of the presentation of the revised rules by Chairman Palmer of the rules committee, Secretary Burritt read resolutions to the effect that both codes of rules as approved by the meeting should be adopted as the standard of the association. In the discussion of these resolutions J. K. Choate spoke on the desirability of getting joint action on operating rules with the American Railway Association and protested against the adoption of the resolutions for that reason, although he appreciated the high character of the work that had been done by the committee on rules. W. H. Collins, Edward Dana and J. W. Brown then spoke briefly in favor of the adoption of the rules as standard without further discussion, Mr. Dana suggesting that joint action could be easily effected by the ensuing committee. When put to vote the resolutions as read were carried.

N. W. Bolen then moved a vote of thanks to the committee on rules for its admirable work, and in particular to Chairman L. H. Palmer for his clear presentation of the work of the committee. This motion was carried by a rising vote and the association adjourned to meet at 9 a. m. Tuesday, certain matters which were to have been brought up by the committee on rules being postponed until that time.

MONDAY AFTERNOON SESSION ENGINEERING ASSOCIATION

The first session of the Engineering Association was held on Monday afternoon. President Hanna called the meeting to order at 2:15 p. m. The first order of business was the presidential address as printed elsewhere in this issue. Secretary Burritt then presented the annual report of the executive committee, consisting of the minutes of the executive committee meetings held Nov. 20, 1913, and Oct. 12, 1914. After the acceptance of this report that of the secretary-treasurer was read and also formally accepted. President Hanna then appointed as a nominating committee Martin Schreiber, chairman; H. H. Adams, Paul Winsor, A. S. Richey and C. S. Kimball; and as a committee on resolutions, F. Kingsley and C. R. Harte.

In the absence of Mr. Litchfield, chairman, the report of the committee on revision of constitution and by-laws was presented by H. H. Adams. Upon inquiry raised by G. W. Palmer, Jr., the chair ruled that the constitution could not be amended at the present meeting as the chair did not think that thirty days had elapsed since notices had been sent to the members, in accordance with the old constitution. However, the by-laws could be approved at this time while the constitution could be approved informally and held over until the next meeting for formal approval. Mr. Palmer then moved that the proposed amendment to the by-laws be approved by those present. The motion was seconded and carried unanimously. On motion of J. G. Smith the constitution was approved informally.

The next order of business was the report of the general standards committee. The report itself had not been distributed but the chairman, Mr. Adams, pointed out that the committee's action on a given subject would be found in the reports of the several committees on the respective subjects. President Hanna then explained that the several reports of the different committees would be handled in this way: First the chairman would take the abstract of his report in general; then each item would be considered separately and with each would be read the action of the standards committee on that particular item.

G. W. Palmer, Jr., chairman, then presented the report of the committee on power distribution.

On motion the recommendation of the committee for a 20 per cent and 30 per cent Para rubber compound specification for rubber-insulated wire and cable was approved.

The specifications for No. 00, No. 000 and No. 0000 round and grooved high-conductivity trolley wire to supersede the specification for No. 00 hard-drawn copper trolley wire and recommendations of the committee regarding reinforced concrete poles and sundry line materials were also approved.

On motion the recommendation of the committee that conditions did not warrant a continuation of the study of influence of large short-circuit currents on multiphase cables and the dynamic force exerted between conductors during the time the short-circuit exists was approved. The meeting also adopted the recommendations of the committee on specifications for high-voltage, three-conductor, paper-insulated, lead-covered cable, and for galvanizing and sherardizing of iron and steel.

Following this the meeting approved the committee's report on copper wire tables, on stranding, on wire and cable terminology and sections 51, 54 and 61 for 600 volts d. c. overhead trolley construction as also approved by the committee on standards. The recommendations on the revision of sections 81 and 82 were referred back to the committee as the committee on standards had recommended that section 82 be so referred and the approval of section 81 alone would have left the wording of the two sections inconsistent.

The report as a whole was then adopted and a unanimous vote of thanks was tendered the committee for its arduous and successful efforts.

The general report of the committee on standards, abstracted elsewhere, was adopted after presentation by Chairman H. H. Adams.

The report of the committee on electrolysis was presented by the chairman, Professor A. S. Richey, and adopted. This report is abstracted elsewhere in this issue also.

DATA SHEET ON MAIL SERVICE

F. W. Doolittle, director bureau of fare research, American Electric Railway Association, has just issued a data sheet to member companies relating to compensation for carrying United States mails. This information is being requested for the committee which has been investigating this subject under the chairmanship of M. C. Brush.

In the report of the joint congressional committee on postage on second-class mail matter and the compensation for the transportation of mail, of which Hon. Jonathan Bourne, Jr., is chairman, there were certain criticisms in regard to the lack of statistics of the cost of carrying steam railroad mail, supplied to the committee by both the Post-office Department and the steam railroads. The electric railway companies do not wish to be under a similar criticism when the question of the cost of transporting mail on electric cars comes to be considered. For this reason the committee wants to have full information on the subject from all the electric roads.

The information particularly desired by Senator Bourne is as follows:

I. Mileage made by railroad post-office cars during year ending June 30, 1914. (a) over postal route; (b) between postal routes and carhouses, not carrying mail; (c) total mileage; (d) hours layover at post-office.

II. Mileage made by freight[1] cars, during year ending June 30, 1914; (a) total mileage whether carrying mail or not; (b) mileage made carrying mail.

III. Mileage made by passenger cars during year ending June 30, 1914; (a) total mileage, whether carrying mail or not; (b) mileage made carrying mail.

IV. All other revenue[2] car mileage during year ending June 30, 1914; (a) total mileage whether carrying mail or not; (b) mileage made carrying mail.

V. Total revenue car mileage during year ending June 30, 1914; (a) total mileage whether carrying mail or not; (b) mileage made carrying mail.

Of the total mileage shown under V (a) how much do you estimate to have been made without revenue load, going to and from carhouses, etc.?

VI. Mileage made by revenue trains (a train to be taken as one or more cars); (a) total mileage whether carrying mail or not; (b) mileage made carrying mail.

The report of the second assistant postmaster general for the year ending June 30, 1913, shows (page 19) the rate of annual payments for electric and cable car service as of June 30, 1913, at various rates. Senator Bourne is also particularly anxious to have from each company a statement of the services rendered and the payments received under each of the various rates: (1) at 3 cents per mile; (2) at 4 cents per mile; (3) under special provision (4) at schedule rates other than 3 cents or 4 cents per mile; (5) at apartment and independent car regular rates; (6) at apartment and independent car maximum rates; (7) at special agreement rates less than regular rates.

Senator Bourne has also especially requested a statement showing the routes, with termini, the service over which is paid for at railroad rates, together with the amount of such payments.

In addition to these questions the committee asks a number of its own in the data sheet for use in presenting its case before the congressional committee.

EXPEDITING CLAIMS

The following is a copy of a letter written by a man in Arkansas to the general freight agent of a Western road as published in a lumber journal:

"In response to my application for indemnity for damage while in transit to one folding bed, I received some time since a postal from you, giving me the interesting information that my claim is number 100909, and suggesting that, if necessary to communicate with you further, I refer to this number.

"I was very glad to get this postal. It is a nice postal and, if not patented, I think I will have some printed myself for the benefit of my creditors. This thing of responding to a dun by giving a reference number in lieu of cash never struck me before. It ought to prove a new factor and a valuable object lesson in the economics of living expenses.

"However, as I am not especially desirous of practicing the theory upon myself, I would be greatly pleased to hear something a little more definite regarding claim 100909.

"If it had been an illegitimate pig metamorphosed by accident and sudden death into a pedigreed Poland China Porker, or a Ban-tailed Mule descended, on the principle of '*de mortuis nil nisi bonum*' from the dear departed Dexter or the late lamented Longfellow, this matter would, doubtless, have met with prompt adjustment, but, being only a bed, just a plain wooden bed, barring the fragments, I fear the claim I am so courteously invited to refer to again, if necessary, has been filed away with the other archives of a like nature, where moth and rust may corrupt, but thieves certainly do not break through and steal, for even a burglar's time is too valuable to be thus wasted.

"If, however, No. 100909 will prove an 'Open Sesame' to the dusty doors of the rusty recess wherein this claim is deposited, I adjure you let the light of day once more fall upon it before mold and moth destroy, and let me know whether it is collectible in the near future, or whether I shall bequeath it, hoary with venerable antiquity, as a relic of the long past nineteenth century to my posterity and for myself trust to meeting it again only on the shore beyond."

[1] Express, baggage, mail, freight, etc.;

[2] Combination—express and passenger, mail and passenger, etc.;

IIb, IIIb, IVb, Vb, VIb—All mileage made carrying mail whether full car or not, and whether car had other revenue load or not should be shown.

COMMITTEE ON SCHEDULES AND TIME-TABLES

The committee on schedules and time-tables of the Transportation & Traffic Association reported yesterday on limited express service, checking car mileage, detention reports and set-backs. As to the first subject it is believed that the best method of improving the running time in city operation is to have stops established at standard spacings with proper signs; the "skip-stop" or odd and even method is considered confusing and annoying to the public. The committee believed that the most feasible method of checking car mileage, short trips and lost trips is by providing space for that purpose on the conductor's day or register card. It opposed any standard form of detention report on the ground of differences in local conditions. It stated that the operation of set-backs should be discouraged and restricted, if possible, to rush-hour conditions, a set-back being defined as a car which left the terminal on the schedule time of a car which had exceeded its running time and layover; then when the set-back car met the delayed car it changed crews, thus placing the belated crew on its schedule. The reason given for this decision was that the plan necessitates holding a crew on the bench under pay, subject to call; it offers opportunity for abuse by trainmen in the way of performing less actual service than is required of them; and it encourages a condition that will eventually have a tendency to slow down the schedule speed and increase platform cost.

Of the four appendices to this report, "A" dealt with limited express service; "B," with train dispatching in city operation as by telephone at Rochester (described in the ELECTRIC RAILWAY JOURNAL for April 18, 1914); "C," with set-backs; and "D," with fundamental factors covering the construction of time-tables, such as distribution and habits of population, physical characteristics of the lines, distribution of hours of platform work, and method of checking changes in travel.

REPORT OF COMMITTEE ON ELECTROLYSIS

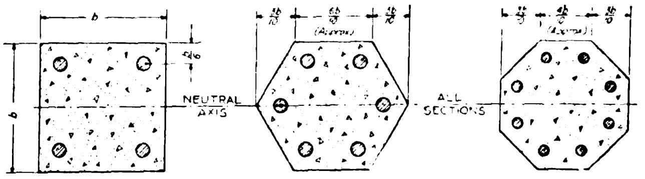
The committee on electrolysis of the Engineering Association reported yesterday on the organization of the joint national committee on electrolysis. The organization of this committee was described in the issues of the ELECTRIC RAILWAY JOURNAL for May 24, 1913, page 934, and April 4, 1914, page 763. The association committee has done some work during the present year along the following lines: (1) a simple presentation on Kelvin's law in easily workable form for the determination of the economic voltage drop in d.c. feeders; (2) the development of a formula and graphic chart showing the economic replacement resistance of rail bonds; (3) a consideration of the proper values to be used in discussing the energy saving to be effected by the addition of feeder; (4) a discussion of the limitations of potential and return circuit, and (5) a bibliography on the subject of electrolysis. This material was not published in the report as the committee wishes to continue the study, but the results are accessible at any time to member companies.

REPORT OF COMMITTEE ON POWER DISTRIBUTION

The report of the committee on power distribution of the Engineering Association, presented on Monday afternoon, contained recommendations as follows: that specifications for rubber-insulated wire and cable for power distribution purposes, as submitted, be adopted as standard; that a new set of specifications for round and grooved trolley wire, as submitted, be substituted for the present standard specification for No. 00 hard-drawn copper trolley wire; that a revision of the specification for galvanizing on iron and steel, as submitted, be adopted; that certain specified changes be made in the recommended specification for 600-volt d.c. overhead trolley construction, and that certain minor changes be made in tables, etc., in the Engineering Manual. The conclusions reached on other matters that were considered by the committee were as follows: that it be given further time to investigate the subject of concrete poles; that further time be allowed for investigation preliminary to the preparation of specifications for sundry line materials, and that further consideration of short-circuit currents is not warranted in view of a theoretical and practical study which has been made by I. W. Gross of the Interborough Rapid Transit Company.

The bulk of the committee's report is taken up with appendixes containing the specifications already referred to. A complete set of wire tables, revised to conform with the recommendations of the American Institute of Electrical Engineers, is included.

One appendix is entitled "Reinforced Concrete Poles of Hexagonal and Octagonal Sections." This article continues the study of the properties of concrete poles as reported in the 1913 Proceedings of the Engineering Association, page 82. The useful data finally arrived at are given below:



COMMITTEE ON POWER DISTRIBUTION—TYPICAL CONCRETE POLE SECTIONS

SQUARE POLE:

$$\text{Deflection } x = \frac{30\ Pl^3}{E_s\ b^4}$$

where x = deflection in inches, 18 in. from top of pole. This is the theoretical value which should be increased 25 per cent.

P = horizontal pull 18 in. from top of pole.

l = length of pole from point of application of P to ground line (6 ft. from base end) in inches.

E_s = modulus of elasticity of steel used.

b = side of square pole or distance between parallel faces in hexagonal or octagonal poles.

also

$$\text{Area} = b^2.$$

$$\text{Safe load, } P_1 = \frac{1750\ d^2b}{L\ (\text{ft.})}\ \text{(Approximate)}$$

where d = diameter of steel rods in inches.

$L = l/12$.

The corresponding values for the other sections are these:

Hexagonal Column	Octagonal Column
$x = \frac{40\ Pl^3}{E_s\ b^4}$	$x = \frac{47\ Pl^3}{E_s\ b^4}$
$\text{Area} = \frac{9b^2}{10}$ (Approximate)	$\text{Area} = \frac{8b^2}{10}$ (Approximate)
$P_2 = \frac{9P_1}{10}$	$P_3 = \frac{8P_1}{10}$
$= \frac{1575d^2b}{L}$ (Approximate)	$= \frac{1400d^2b}{L}$ (Approximate)

where P_2 and P_3 are the respective safe loads.

Per cent of steel equals 4 in all sections, approximately.

COMMITTEE ON STANDARDS

The report of the committee on standards of the Engineering Association presented in tabular form the recommendations of the committee on standards with regard to the standards and recommended practices submitted by the various standing committees of the Engineering Association. In accordance with the custom established last year, detailed statements of the findings of the standards committee accompanied the respective reports of the several standing committees and these are printed in the digests of the reports.

REPORT OF COMMITTEE ON CHANGES IN CONSTITUTION AND BY-LAWS

The report of the committee on changes in constitution and by-laws, presented yesterday to the Engineering Association, contained in general such changes as were necessary to eliminate contradictory points and to revise the articles according to the conditions existing under the present organization of the American Association. The chief sections redrafted dealt with the membership, the nomination of officers and the offices of secretary and treasurer.

The old designation of "active" and "associate" members has been dropped and the membership of the Engineering Association is now to consist of "company members" and individual members of the American Electric Railway Association who have elected to ally themselves with the Engineering Association. The individual members will not be entitled to vote and may hold office only if in the employ of company members. They are granted the following rights: Attendance at meetings and participation in discussions; membership on committees; receipt of association proceedings and other general publications, including *Aera* and advance convention papers, and the wearing of the official emblem.

Provision is made in the new constitution for a nominating committee of five members, two to be past presidents and the other two not members of the executive committee, to be appointed by the president at the time of the formation of standing committees. This nominating committee is to secure the names and consents of nominees and forward the names to the secretary on or before July 1. The list of nominees is to be published in the August *Aera*. A written communication to the secretary, signed by twenty company members and accompanied by the nominee's acceptances also constitutes a nomination. The nominating committee is given power to fill any vacancy in the list of nominations prior to election.

The old constitution provided that the duties of secretary and treasurer should be performed by the same person, but under the new provisions this doubling up of duties is optional. Hence, in the section dealing with the duties of the secretary and treasurer these are divided to come under the proper head. Each of the two officers may be paid a sum fixed by the executive committee.

YESTERDAY'S SESSION OF THE CLAIMS ASSOCIATION

The first session of the Claims Association was held in Claims Hall on the pier and was well attended. The first order of business was the address of President Weh, which is published in abstract elsewhere in this issue. This was followed by the reports of special committees. Mr. Drown's committee reported on the claims index bureau. He followed the report of his committee with a written discussion which indicated that the member companies were not taking the interest they should in the bureau. As a result of this report a committee was appointed to set a time for a general discussion of the subject and to report to the executive committee of the parent association This committee included Messrs Tichenor, Drown and Walsh. Immediately following this session this committee held a meeting and arranged for an open discussion of the advisability of the executive committee parent body continuing to pay $500 a year for the service of the bureau. This open discussion of the value of the claims index bureau will be held Tuesday morning immediately after the joint session with the Engineering, Transportation & Traffic associations.

Continuing the program, E. P. Walsh, attorney United Railways, St. Louis, read a paper entitled "How Investigations Should Be Conducted from a Legal Point of View, Having in Mind Defense as Well as Adjustment." This paper was followed by written discussions by L. S. Hoffman, general solicitor Public Service Railway, and Wallace Muir, claim agent Kentucky Traction Terminal Company.

The session closed about 5 p. m.

COMMITTEE ON RULES

The committee on rules of the Transportation & Traffic Association stated in its report that the standard city and interurban codes of rules have come into general use, no fundamental objections to them apparently existing. The city code was said to have reached the stage where further radical revision was unnecessary, and a final revision for the interurban code was submitted as an appendix, thus placing both codes in practically permanent form. The committee recommended that, where all operation was of one-car trains, no markers should be used by day, but, where trains of more than one car were operated, all trains should carry green-flag markers. Classification signals located at the middle of the first car on a train were also recommended, as well as markers on the top of the rear car. The committee further recommended the following addition to the much-discussed rule 55, of the city code, on the subject of trainmen giving out information in case of accidents or delays: "Conductors may, when necessary, however, advise passengers as to the general cause and probable duration of a blockade." This addition was believed to be in accordance with the interests of the traveling public.

GERMAN MANUFACTURERS IN ENGLAND

The present war between two countries which have conducted commercial affairs with each other so long as Germany and England has brought about situations which seem peculiar as well as problems which are difficult to solve. Some of those are discussed at length in our English technical contemporaries. Thus an extended discussion appears in several successive issues of the London *Electrical Review* in regard to the proper status of certain electrical manufacturing concerns of whose capital stock a considerable part is said to be owned in Germany. One of the most prominent of these is Siemens Brothers & Company. A number of closely printed pages are devoted in the paper in question to discussions as to whether the British electrical trade ought to boycott such manufacturers because of their stockholders or should continue to patronize them because of the British employees who would be thrown out of employment if a boycott was instituted. The majority were in favor of no boycott. The discussion on this point, however, elicited the statement that some of the concerns engaged in the electrical business in Great Britain and owned almost entirely in Germany rejoice in names of a purely British character. This is additional corroboration to the truth of Shakespeare's remark, "What's in a name?"

Other "war news" in the same periodical include correspondence between a British firm and a German collection agency in which the former declines to pay its account unless required to do so by the British courts, statements in regard to orders for equipment originally placed in Germany but canceled and now being supplied by home concerns, contributions by different companies to the Red Cross funds, and reports in regard to the number of employees from different tramways and other electrical companies who have joined the colors. Several corps of engineers have been raised, and service in them has been very popular among the electrical engineers.

The Galena-Signal Oil Company extends a most cordial welcome to all convention delegates and their wives and children to its reception tearoom at booth 24. Its tea, like good wine, needs no bush.

ADDRESS OF PRESIDENT HANNA OF THE ENGINEERING ASSOCIATION

In the opening part of his address yesterday President Hanna referred to the proposed revision of the association by-laws and constitution so as to make them conform more with those of the American Association and of the other affiliated associations. The most important change, he said, was in the provision for a new method of nominating officers whereby the members will have an opportunity to know in advance who are to be the nominees and suggest others if they see fit.

President Hanna then referred in detail to the work of the various committees of the association as shown by their reports and mentioned some of the principal conclusions reached. Among other points he referred to the fact that during the past year the Lorain Steel Company had cut rolls for the standard 7-in. and 9-in. grooved girder rails recommended by the way committee last year, and these rails had now been adopted by railway companies in Montreal, Boston and Columbus. He said that during the coming year it was the plan to reduce the number of subjects assigned to each committee, partly to relieve the task imposed upon committee men but also on account of limited time at the disposal of the association to consider these reports at the annual convention.

The address then mentioned the Engineering Manual, a result of the standard committee's activity, which had been distributed to all members during the past year. A yearly revision of this Manual will keep it up to date. Up to the present time 1097 copies have been distributed to members and eighty-one have been sold. Mr. Hanna urged all members to assist in the distribution and sale of this Manual, not only on account of the financial help it would be to the association but also so that the work of the association in establishing standards would be utilized and appreciated to its fullest extent. It had been decided to extend the free distribution of this Manual to all individual members allied with the Engineering Association who joined prior to Jan. 1, 1915.

The address then stated that during the past year the Engineering Association had kept within its appropriation of $4,000 and had also been able to clear up the deficit for the past two of three years.

The address then mentioned the co-operative work of the association with other associations, particularly the arrangement with the Central Electric Railway Association providing for the prompt reference to the standards committee of any standards adopted by that association, and of the joint commitee on overhead crossings.

Mr. Hanna then urged that the membership in the association be increased and mentioned the many direct benefits which accrue from membership including the receipt of *Aera*. He concluded by expressing his thanks for the assistance which he had received from the executive committee and each chairman of the different committees and also from the secretary-treasurer and his able staff.

EMBRYO SCHEDULE MAKERS

An almost continuous cause of complaint among trainmen is the way in which schedules are arranged. Unless a man has actually attempted to make out a time-table he little realizes the difficulties of arranging the runs to meet the requirements of travel and at the same time allow the men to complete their day's work within reasonable hours. For this reason the United Railroads, San Francisco, Cal., has offered, through President J. W. Lilienthal, a prize of $25 to the platform man submitting the best time-table for the company's Haight Street line. The announcement was made in the *United Railroads' Magazine* for September, 1914, and a table of headways from the ferry was furnished for the benefit of the men. The competition closes Nov. 1.

ADDRESS OF PRESIDENT WEH OF THE CLAIMS ASSOCIATION

In his address at the opening of the Claims Association yesterday afternoon, President Weh called attention to the fact that this was the tenth annual convention of the Association and to the progress which has been made by the claims department of the different companies during this period. For the Claims Association to grow, he said, it must have the hearty real co-operation of the membership, and this should not be limited to what is done at the conventions. He then referred to the report of the joint committee of the Claims Association and the Accountants' Association on claim accounting as a most important matter and one which could well have been taken up earlier.

President Weh then spoke of the improvements in electrical appliances and equipment which had taken place during the past fifteen years and said that they had been no more startling than those made in the conduct of electric railway claim departments during the same time. The companies now realized that they must improve their relations with the public. The effort is being made to do so, but the mistakes of the past are not to be undone in a day. Public sentiment is so strongly for better things that it is easily led from regulation to oppression, and this attitude is reflected in large verdicts in damage suits, in common law defence and changes in jury systems.

The claim department on any public service company comes in direct contact with many individuals, and the more justly it treats with them the more justly will it be treated. President Weh recommended that the companies deal fairly with those who have legitimate claims, but to use an iron hand for crooks. The most essential defence against the latter is to have all the facts. No case is so trivial but the company can use all the information available.

President Weh then referred to the service of the Hooper-Holmes Index Bureau. The arrangement with this bureau was made only after a number of years of discussion and after the value of such a service to the association had been fully determined upon. Now it was found that only a small percentage of the member companies availed themselves of service furnished by this bureau and that this patronage was made up almost entirely of the larger companies. He believed that there was no way in which it was possible for the member companies to secure a service equal to or better than that furnished by the bureau, and if this service was discontinued the member companies would be left without any clearing house of this nature except by paying the individual subscription fee direct, which many of the smaller companies could not afford to do.

Mr. Weh then referred to accident prevention, which had become a very important phase of the work of the claim agents. Great progress had already been made in this direction, but he believed a greater accomplishment was possible and really in sight. He mentioned the appointment at the last convention of a board of accident prevention, made up of the past presidents and present officers of the Claims Association with representatives from the Transportation & Traffic Association and the Engineering Association. This committee had prepared a report which would be presented at this convention.

In closing, Mr. Weh extended his wish to all for a successful and pleasant week and thanked the members of the executive committee of the association for their loyalty and kindly feeling during his year of office.

In order to secure information regarding the relative business done by steam and electric roads during the State Fair recently the Ohio Public Utilities Commission had the arrivals on each counted during the forenoons of two days. On one day the electric lines carried 27 per cent and the other 34 per cent of the passengers.

ADDRESS OF PRESIDENT HEGARTY, OF THE TRANSPORTATION AND TRAFFIC ASSOCIATION

Secretary Burritt read yesterday the address prepared and sent to the Transportation & Traffic Association by D. A. Hegarty, who was elected president of the association last year but resigned March 1. After expressing his regret that he was not able to continue the office of president, Mr. Hegarty briefly reviewed the progress made during the short period when he was in office. He described the mapping out of the year's committee work by the executive committee in December, 1913, and also the joint committee work undertaken between the various associations. In the latter connection, Mr. Hegarty stated that the amicable manner in which joint committees had worked in harmony showed the cordial feelings that existed between the different associations and made for increased efficiency and service.

Mr. Hegarty suggested that a joint committee be formed between the Transportation & Traffic Association and the Claims Association to take up the subject of platform operating doors and gates, as to which is the most efficient and economical, manually, mechanically, electrically or air-operated doors. This committee should also determine what would be the best way for the motormen or conductors or both to operate the doors or gates. In view of the importance of the "safety first" movement and the prevention of boarding and alighting accidents, this study was, in Mr. Hegarty's opinion, a most important one for the two associations named.

Mr. Hegarty called attention to the discussion of the flagging rule that has been commented on several times in the ELECTRIC RAILWAY JOURNAL, and stated that this work was eliminated at the meeting of the association in 1911, but that a thorough discussion should be had so as to reach a definite conclusion. As regards the committee on fares and transfers, he felt that in spite of the highly valuable reports previously received sufficient time had never been given for a thorough discussion of this subject, especially in connection with transfers and their checking.

In closing his address, Mr. Hegarty emphasized the importance of perfecting the safest and most economical method of handling traffic and developing more cordial relations with the public. He believes that conscientiousness is necessary on the part of the employees who deal with the public, from the highest official down to the last graded employee, for it produces a public conscience that results in a spirit of fairness and confidence.

BE AS "AISY" AS YOU CAN

In connection with the work on one of the chapters for the souvenir edition of this paper it became necessary to solicit some material by mail. The following reply to one of the letters is too good to be lost to view in the letter files:

"Your letter of Aug. 21 was received. It has been impossible for me to reply sooner, by reason of the fact that time was not at my disposal. When a man is acting as assistant to the general manager of this company, and editing the * * * * writing editorials, culling out bunc and rounding pearls of thought into readable form, he don't git no time for flights into other journalistic realms. As a writer, I hate to put a story together for the pleasure of the thing, but as a tramway employee, I should like to oblige you. You probably know how you'd feel, if I should ask you for a story on power economy, for instance.

"Please let me know when you have to get this story. I am going down on my ranch for the next two weeks, where I can wear old clothes, turn my debonair map up to the sun and commune with Nature and the family dog. When I return it will be necessary to throw 'er over onto the loop and get out the October issue. People don't realize how much work there is on a forty-page street car blatter.

"You can see what I'm up against, therefore, be as aisy as you can."

MADAME AULD

The entertainment committee was exceptionally fortunate in securing the services of Madame Auld, the prima donna soprano from Milan, as soloist for the reception last evening. The audience received her opening selection, the aria from the mad scene of "Lucia Di Lammermoor," with great favor. Her encore "Un Bel 'di'" met with equal enthusiasm. Madame Auld has recently returned from Europe where she is well known, having sung in Milan, Rome, Budapest, Paris, London and Berlin. Von Strauss, director of Royal Opera of Berlin, has said that she had possibly the most beautiful voice he had ever heard, and Knehbiel, critic of the New York *Tribune*, has praised the rich, natural qualities and warmth of her tones.

RAILWAY MEN AN EXACTING LOT

According to the Philadelphia *Public Ledger* the railway men in attendance at the convention are "an exacting lot." At least that is what the correspondent of that paper said in his Atlantic City column in the issue of Oct. 12. After referring to the prevailing fall fashions as seen on the Boardwalk the writer said:

"In the throng were many glad-to-be-free delegates to the annual convention here this week of the American Electric Railway Association, snappy-looking men of affairs upon whose broad shoulders and astute minds depends very largely the maintenance of rapid transit in cities both large and small throughout the country. Hotel exchanges resounded with their merry greetings, and North met South and East the West in the midst of the Wooden Way throng. Philadelphia also contributed battalions to swell the procession and give the rolling chair barons a better day's business than has been their lot for several weeks. Once more there is a bath famine in the big Boardwalk hotels, for the holiday-making railway men are an exacting lot."

In a separate story almost a column long the general activities of the association in connection with the convention were reviewed.

FOR CLAIM AGENTS

A reporter on a Kansas City paper was among those on a relief train that was being rushed to the scene of a railway wreck in Missouri. About the first victim the Kansas City reporter saw was a man sitting in the road with his back to a fence. He had a black eye, his face was somewhat scratched and his clothes were badly torn—but he was entirely calm.

The reporter jumped to the side of the man against the fence.

"How many hurt?" he asked of the prostrate one.

"Haven't heard of anybody being hurt," said the battered person.

"What was the cause of the wreck?"

"Wreck? Haven't heard of any wreck."

"You haven't heard of any wreck? Who are you, anyhow?"

"Well, young man, I don't know that that's any of your business, but I am the claim agent of this road."—*Harper's Magazine*.

The Manila Electric Railroad & Light Company, Manila, P. I., has opened a lunch room for its employees in its carhouse on Calle San Marcelino.

NEW ARRANGEMENT OF MEETING HALLS

Through the efforts of the exhibit committee, the comfort of the delegates at the technical sessions should be greatly enhanced this year in connection with the arrangement of meeting halls. Two new halls have been built, and other changes have been made to provide better accomodations for the various sessions. One of the improvements, which will be most welcomed by the delegates will be in connection with the meeting rooms for the affiliated associations. All of the associations will now have comfortable, well-lighted rooms at the end of the pier.

Two new rooms have been built during the past summer for this purpose. One is designed for the Accountants' Association. This is at the end of the Annex near the Greek Temple and on the south side of the pier. Here a special hall has been partitioned off with chairs to accommodate about eighty delegates. It is festooned with flags and provided with window curtains and floor covering. There is no long flight of steps to mount as last year.

The American Electric Railway Claims Association has been accommodated with a similar hall also adjoining the Greek Temple and on the north side of the pier. This hall is large enough to accomodate the number of delegates which it is expected will attend the meeting of the Claims Association.

The American Association and the Transportation & Traffic Association will meet as usual in the Greek Temple. The Transportation & Traffic Association will meet in the morning and the American Association in the afternoon. The decorations here typify the international character of the association.

The hall to be used by the Engineering Association is the same as used last year, but Mr. McConnaughy has had a floor covering laid over the passageway for the public at the side of the hall so that there should be no disturbance from the noise from passers-by, even if the windows are open. All of the halls are well lighted.

CHANGES IN PIER ARRANGEMENTS

A number of changes in the arrangement of the convention pier and the exhibits will be noticed by the visitors to the convention this year. These have been worked out by H. G. McConnaughy, director of exhibits, and add very much to the comfort of the delegates and others in attendance, as well as to the attractive appearance of the exhibits. They include improved facilities for technical sessions, exhibits and entertainments.

The first change which the visitor to the pier will see this year is at the entrance. A neat pair of posts each of which is surmounted by a vase with ferns, flanks the main entrance. The registration desks are directly inside the front door, the desk for the railway delegates being at the right and that for the manufacturers at the left. Here the delegates register, but this preliminary has been greatly simplified this year by the system of advance registration which both the American Association and the Manufacturers' Association have encouraged. Those who took the precaution to send in their advance registration cards need lose little time in securing the proper badge. In the case of a member of the Manufacturers' Association these badges are obtained after he passes through the gateway and turns to the left.

The foyer of the pier this year is entirely different from that of last year. The alabaster columns surmounted by lights in globes, which were a feature of the entrance of the 1913 convention, have disappeared. In their place is a series of very graceful standing electroliers of gilt surmounted by ten or a dozen single lights with colored shades. These electroliers also line the grand aisle leading to the end of the hall and are supplemented by colored lights in the hedges.

The foyer bore three separate guises yesterday. The first was apparent in the morning during the concert, when the space was opened and occupied by those who were listening to the music. Between 1:30 and 2:30 a rapid transformation took place. The bare floor was covered as by magic with grass. Tables, surmounted by individual awnings, appeared in place, and tea was served during the thé dansant. In the evening another change was made, and the foyer became a ball room with gold decorative effect during the annual reception.

Passing now to other parts of the hall, another striking improvement which the visitor saw yesterday when he entered the hall was the change in Machinery Hall. Formerly this was separated from the main hall by a rough board partition, and no attempt was made at decoration. This year the partition has given place to a cedar and box hedge. The floor of Machinery Hall has been laid throughout with Crex, and windows have been draped with curtains. In addition, the different exhibits are separated by graceful pedestals and, in the case of most of the exhibits, by flowers and shrubs in pots. Machinery Hall seems now as much a part of the general decorative effect of the exhibit as any other. Finally a reception room has been located at the west end of Machinery Hall to afford a place for rest and conferences during convention week.

The improvements made in the pier this year are not confined to the first hall. An important change has been made in the rear of the annex by installing glass frames so that all of the annex is under cover. This was done as a protection against possible rain, and, while the indications are toward a pleasant week, this is an improvement which will be greatly appreciated. Changes have also been made in the meeting halls, as described in another column.

DEATH OF MR. WHITTLESEY

Curtis E. Whittlesey, for many years treasurer and secretary of the McGraw Publishing Company, Inc., died at his home in Madison, N. J., on Friday, Oct. 9, 1914, in his seventy-second year. Though he had been ill of pneumonia for several days, the end came suddenly.

Mr. Whittlesey was born near Rochester in 1842. As a young man he entered business in Corfu, N. Y., where his industry and capacity brought him early success. In 1890 he joined James H. McGraw as a member of the firm which was the publisher at that time of the Street Railway Journal, and which, as the present McGraw Publishing Company, Inc., became also the publisher of the *Electrical World*, *Engineering Record* and *Metallurgical and Chemical Engineering*.

During the twenty-four years of association with this publishing enterprise Mr. Whittlesey had become widely known as a man of great experience in business affairs, and his wisdom and unerring judgment were constantly consulted not only in the affairs of the company, which he had done so much sucessfully to establish, but by many individuals who had come thoroughly to value his opinions on commercial and financial questions. Although his passing came with the ripeness of years, it is deeply lamented by a host of friends, many of them close business associates, who loved and honored him. It was impossible to have even the most cursory relationship with him without being impressed by his lovable qualities and sterling character.

Mr. Whittlesey was keenly interested in church work, and was for years an elder and the treasurer of the Presbyterian Church at Madison, N. J.

He leaves a widow and three daughters, Mrs. Carl A. Felt, wife of the Rev. Carl A. Felt, of the Pekin University, China; Mrs. James H. McGraw, wife of the president of the McGraw Publishing Company, Inc., and Mrs. Robert E. Harned, wife of the Rev. Robert E. Harned, librarian of the Drew Theological Seminary, Madison, N. J.

CIRCUMSTANTIAL ACCIDENTS

A singular feature of many accidents, when carefully analyzed, is the part played in such events by a chain of circumstances leading to the untoward result. On such occasions relationships between conditions and objects are brought out which would otherwise remain undetected for long periods. Thus, in a recent carhouse fire which, fortunately, was extinguished by the employees of the local company before it gained headway, the sequence of events was most illuminating. The trolley wheel of a car that was being run into the house with the trolley pole in the reversed position, left the wire and swung around sufficiently to clear the wooden guard on the overhead timbers, struck the beams and came in contact with an iron conduit carrying a lighting circuit. At the same time the trolley pole buckled, making simultaneous contact with the wire, and thereby grounding the latter. Current passed over the conduit to the ground at the rear of the building. In contact with the grounded pipe was a metal ash barrel. As a result the conduit was melted where it entered a junction box on the ceiling and a fire was started at that point; the ground wire at the rear of the building was melted off and the ash barrel was melted at points of contact with the pipe; and current also passed to the second floor, where connections of soil pipes at metal sinks were burned off and a fire started among some towels on an adjacent side wall. Quick work saved the company a heavy loss.

Obviously it is often very difficult to forestall the interrelation of circumstances in connection with the prevention of fires and accidents, but in all such work the efficiency of prevention is largely a matter of putting factors together which may cause trouble and mentally sizing up their possibilities for harm. In other words there is a sort of accident chemistry, with some elements which must be kept apart and others which are better kept together. Clearances, insulation, temperatures, speeds, momentum of masses, lost motion, unnecessary contacts and many other points need to be considered by the constructive imagination, trained by analysis of causes and effects to sense the opportunities for danger to enter the situation. Carelessness in some small particular so often sets in motion a whole train of evils that in carrying forward a broad campaign for safe operation no better work can be done by employees and officials directly responsible for handling rolling stock and plant than to forecast the results of all sorts of slips and errors and to take steps in time to restrict their effects to the harmless field. By paying heed to the man with the alarmist type of mind in such work a great many troubles can be prevented.

GENERAL RAILWAY SIGNAL COMPANY'S PAST PERFORMANCES

The General Railway Signal Company has made its record of installations the keynote of its exhibit. A number of views of signals on various railways are shown in large colored pictures that are remarkable for their artistic effect as well as for their accuracy of detail. The installations include that made at the Grand Central Terminal in New York City, where an interlocking plant of extraordinary magnitude is in service as are also automatic signals governing train movements on the electrically operated lines leading into the terminal. The installation on the San Francisco-Oakland Terminal Railways is also shown. This is unique in that it has automatic stops consisting of overhead trips which are operated directly by the semaphore arms, the trip being engaged when the semaphore is in horizontal or stop position and being lifted out of the way when the semaphore moves up into proceed position. A view is also shown of the automatic stop of the track-trip type that is installed on the Centre Street Loop and Williamsburg Bridge line of the New York Municipal Railway.

MODERN POWER HOUSE SPECIALTIES

At spaces 158 and 160 of the Harrison Safety Boiler Works water is pumped through a Cochrane metering heater, showing just how the water is broken up in the tray section, where it is heated by the exhaust steam, after the steam has been cleaned of oil by means of the Cochrane oil separator on the inlet to the heater, which is equipped with a compact and fool-proof cut-out and by-pass arrangement. Then it can be seen how the water passes over the V-notch built in the heater, and how the height of water flowing over this weir is transcribed into a graphic record of the amount at which the water is fed to the boilers, affording means for checking boiler efficiency, heat value of coals, the most desirable methods of firing, etc. These metering heaters are built in units up to 20,000-hp capacity.

The Cochrane precision meter, also shown in operation, measures water by automatically filling and emptying two chambers of known capacity. The distinctive feature of this meter is that it is necessary for one chamber to be absolutely empty and the other chamber to be completely filled before the inlet and discharge valves are operated. Other exhibits include the Cochrane multiport safety exhaust outlet valve, which is essentially a safety valve for low-pressure work; the Cochrane multiport flow valve, which is a modification of the Cochrane multiport relief valve, and is designed to act as a vacuum check valve between low-pressure cylinders of engines and low-pressure or mixed-flow turbines; and the Sorge-Cochrane Hot-process system, which is designed for preventing scale formation and corrosion by boiler feed water. The company's chemist is present to give demonstrations on various hard waters, showing the results obtained by treating the water cold, and then by treating it hot by this company's method.

A SUB-STATION ON THE PIER

The Railway & Industrial Engineering Company, Pittsburgh, Pa., has taken space 609 in the Annex, on the way to Engineering meeting room, for a display of Burke horn gap switching and protective apparatus for all voltages from 2,200 to 66,000 volts. In addition to the apparatus exhibited photographs and drawings picture various applications and installations designed to meet different requirements. In this booth can be seen the new Burke series horn gap lighting arrester with Koppat resistance in the ground circuit. A three-pole Burke horn gap switch mounted complete on a wood pole; also the Burke horn gap switch with the new flexible Butt contact, which makes the switch absolutely weatherproof and overcomes entirely the possibility of the switch freezing up. The company has oscillograph records which were taken during the opening of Burke horn gap switches under 4000 kw. and 5000 kw loads at 50,000 volts, also the standard 45,000 volt switch used to open these loads. It also has for inspection a 2200-volt and 6600-volt suspension type lighting arrester with resistance in the ground circuit, horn gap fuses, T. E. line clips, which make it possible to tap transformers and other high-voltage apparatus to live lines, and commutator slotting tools. Just outside the Annex near the Engineering meeting room is installed a complete steel outdoor transformer substation of a new design built to meet interurban requirements. The station is absolutely complete in every respect. The switching and protective equipment for the high-voltage side consists of a Burke horn gap switch and a combination lighting arrester, choke coil and fuse. A 2500-volt automatic weatherproof oil circuit breaker and suspension type lighting arresters protect the low-voltage side of the transformers, and a steel cabinet box houses the metering equipment. This type of substation is particularly adapted for tapping high-voltage transmission lines for small amounts of power. The new T. E. lattice steel pole is also shown here.

WESTINGHOUSE MACHINE COMPANY SHOWS TURBO-EXCITERS

The Westinghouse Machine Company is showing an A-50 kw, 125-volt d.c. unit, which is being widely used for exciter service. Three units built at present in sizes from 25 to 200 kw consist of a high-speed, single-wheel impulse type of turbine connected by means of a Westinghouse reduction gear to a standard inter-pole generator. By means of reversing chambers the steam passes through the blades two or more times, depending on the operating conditions. The reduction gear and pinion are of the split helical type mounted in ring-oiled bearings and inclosed in a horizontally split oil-tight case. These units are adapted for both condensing and non-condensing service for steam pressures of 100 lb. or more. By using a high speed turbine a low water rate is obtained over a wide range of load.

GENERAL ELECTRIC COMPANY FEATURES

The General Electric Company's display of railway motors this year features some notable improvements. These motors represent six classes of electric traction work; the GE-239 motor, rated 1200-2400 volts, 150 hp, on the Michigan & Chicago and Canadian Northern for heavy through service and tunnel electrification; GE-240 motor, rated 600-1200 volts, 80 hp, on the Willamette Valley Southern for high-speed interurban service; GE-242 motor, rated 65 hp at 600 volts and 55 hp at 500 volts, for the Chicago Surface Railways; GE-243 600-volt motor, for the Chicago Elevated Railways; GE-248 motor, rated 160 hp at 600 volts, for subway service on the New York Municipal Railways; GE-247 motor, rated 35 hp at 600 volts and 30 hp at 500 volts, for low, 24-in. wheel car, city service on the Pittsburgh Railways. The GE-247 motor is exhibited in operation, while the armatures of the remaining motors are removed to afford an opportunity for easy inspection of the interior construction.

The Sprague-General Electric type MK all-electric control equipment shown embodies new connections and is designed for four 30 hp motors. A chart shows the circuit connections established. Four K patform controllers are also displayed, which are types K-51, K-36, K-35 and K-201.

A combined straight and automatic air-brake equipment is mounted on a rack as on a car. The CP-27-B compressor with this equipment has a special glass cover and lamps in order to illuminate the interior and show the flow of oil. The recent, light-weight CP-25-C, 600-volt compressor is also included. A complete assortment of line material, including catenary, is attractively grouped on a large frame. Many of these devices are mounted as in actual service. A number of separate valves and devices entering into car equipment also form part of the company's exhibit.

Forged-steel treated gears and also cast-steel split and solid gears for both city and heavy interurban service are shown, as well as several grades of forged steel treated pinions. The new sheet steel gear cases have each of their upper and lower halves pressed out in a single integral piece. The steel supports for the top and bottom halves are fastened by welding.

An extensive exhibit of headlamps for various classes of electric railway service is shown. The line comprises type D-18, 4-amp, luminous arc lamp with semaphore lens for high-speed interurban service, dimming being effected by incandescent lamps; type D-12, 4-amp, luminous arc lamp with plain glass door and parabolic reflector for slow-speed interurban service, reversed polarity dimming; type D-11, 2-amp, portable luminous arc lamp with semaphore lens for city and suburban service; type J-7, incandescent headlamp with parabolic reflector for city and suburban service; type J-9, incandescent lamp with parabolic reflector for city service; and type J-15, incandescent lamp with semaphore lens and guard door for city service.

The display of railway lamps demonstrates how much more effective results have been obtained through the new systems of illumination in railway cars. Both the old style carbon lamps and the modern Mazda lamps that are now generally employed figure in the display. Improvements in the wiring arrangement as well as the selection of lamps and the use of reflectors are clearly illustrated. Shadow boxes and photometric curves demonstrate the relative values of the illuminating units. An exceptionally interesting feature of this part is a new boron car lighting regulator outfit to maintain the voltage on car lamps approximately constant for a wide variation in trolley voltage. Thus there has been recently developed the boron filament lamp with a decided negative temperature coefficient, which has the valuable characteristic that the voltage across the terminals of the lamp remains practically constant for a wide variation in current. A tungsten resistor has also been developed, which has a very high positive temperature coefficient and a characteristic such that the voltage drop across the filament increases very much faster than the current that produces the drop. While both the regulator and resistor are made in the form of lamps of various current capacities, the filaments are intended to run at a relatively low temperature, so that they cannot be used directly for lighting. If, however, the proper number of boron filament lamps are connected in multiple with the proper number of circuits of car lights and the proper number of tungsten resistors are connected in series with this combination, a regulator outfit is obtained that will maintain the voltage across the car lamps within about 3 per cent either way from normal for a variation in trolley voltage between 400 and 625. The principle of operation is very simple. The high positive temperature coefficient of the tungsten resistors prevents very wide fluctuations of current for changes in trolley voltage, and whatever fluctuations of current do result are automatically taken by the boron regulator lamps connected in multiple with the car lamps, so that the current through the car lamps, and consequently their candle-power, remains practically constant.

INDEPENDENT LAMP & WIRE COMPANY'S EXHIBIT OF ASBESTOS-COVERED WIRE

The Independent Lamp & Wire Company, in space 527, has a very instructive exhibit designed to demonstate the superiority of asbestos-covered wire over cotton-covered wire. One piece of apparatus consists of a field-coil testing transformer around the core of which are placed loops of wire made up of short lengths of asbestos-covered and cotton-covered wires connected in series and short-circuited. When the primary switch is closed the wires promptly heat up and after the cotton is burned off the asbestos remains as good as new. A coil of asbestos-covered wire is then placed around the core of the transformer in a pan of salt water. An incandescent lamp connected to the coil lights up to full brilliancy, indicating that the coil is not short-circuited by the water. Another piece of apparatus is a heating-element coil around which are wrapped turns of cotton-covered and asbestos-covered wire. The coil is heated up until the cotton insulation burns off. To indicate the temperature of the coil, solder wire is applied to a metal band surrounding it, and the melting of the solder gives a convincing demonstation of high temperature. An important element of the activities of the company is the reinsulating of "roasted" magnet coils of all kinds. When such a coil is received the old insulation is first removed and the wire is annealed. The wire is then welded up and reinsulated with asbestos and either rewound in the original form or returned to the customer on reels. A large collection of pictures is shown to illustrate the many kinds of work for which coils have been reinsulated and several actual coils are exhibited. There is also a sample board and numerous separate samples showing the company's work. Wires are insulated in sizes from No. 31 to No. 0000.

U. S. SIGNALS WITH A. E. R. A. ASPECTS—NON-SPLASHING ELECTRIC TRACK SWITCH

At space 401 the United States Electric Signal Company is exhibiting its standard line of apparatus, including the Type K and Type K^2 counting signals, the Type G signal, which allows but one car in a block at a time; the crossing bell, the S C signal, the Type M signal, the No. 9 contactor, the new current regulator and the Collins Type A electric track switch.

The S C signal is a counting type of signal, differing from the Type K and the Type K^2 signals in that it uses the indications recommended by the signal committee of the A. E. R. A. These indications are an all-light indication. The green light burns normally when there is no car in the block. The red light indicates danger and a red light staggered with a yellow light indicates a car in the block going away from the signal.

The new features which have never been exhibited before are the Type M signal, the No. 9 contactor, the current regulator and the Collins Type A electric track switch.

The Type M signal is an all-light signal, and is made practicable for use on electric roads where the trolley voltage is used for the signal by the use of a current regulator which keeps the lights constant, regardless of the fluctuation in voltage. One of the most novel features of this signal is the fact that the car is counted out of the block by a peculiar yet simple sequence of electro-mechanical actions. These actions cannot be reproduced by any combination of line wire troubles. This is a matter of greatest importance as a safety feature, for the most dangerous thing that can happen to a signaling system is to have the car counted out by line troubles while the car is still in the block. This signal shows no lights when there is no car in the block, shows a yellow light when a car is in the block going from the signal and a red light for danger.

The new No. 9 contactor has the novel feature that the contact finger is mechanically locked into the open non-contacting position, and cannot be jarred into contact by a trolley pole or any external jar.

The current regulator is a simple laminated wire solenoid device for regulating the current so that the amperage remains constant in the signal lights, regardless of the fluctuation in voltage. This is accomplished by the core of the solenoid shunting steps on a resistance tube for increasing or reducing the resistance in the line as the voltage rises or falls.

The new Collins Type A electric track switch has many new features never before incorporated in an electric track switch. Some of these points are that the switch cannot splash mud and water on pedestrians. The switch cannot be thrown between the trucks of a car by a following car. A most positive anti-straddling device is also a feature. The street box is automatically sealed without the necessity of making up any gaskets or pipe joints. Only 110 volts is used in the street box.

Messrs. Gammons, Bowen and Collins are representing the company.

PROTEAN COUPLER AT WESTINGHOUSE TRACTION SHOW

The success of the Westinghouse Traction Brake Company in meeting the requirements of modern electric train operation appears again in the present operating exhibit of its tight-lock car, air and electric coupler which automatically couples the electrical and air connections as well as the cars. Aside from this remarkable device, the company is making its usual extensive display of air-brake apparatus.

Jacks of all types, but all good, are shown by the Duff Manufacturing Company, including street railway emergency jacks, Duff high-speed ball-bearing screw jacks, Barrett Jacks, Duff-Bethlehem hydraulic jacks.

SAFETY DOOR DEVICE OF PREPAYMENT CAR SALES COMPANY

The Prepayment Car Sales Company, space 414, is displaying here for the first time its new line switch, safety device door control. This idea was first suggested by Harold Rowntree, treasurer of the company, who took out a patent on it in 1906. The late Frederick H. Lincoln, of the Philadelphia Rapid Transit Company, suggested another improvement on the Rowntree device and also took out a patent, which the Prepayment Car Sales Company acquired. These two patents may, perhaps, be best understood by referring to them as "the horse" which, of course, was not very useful without a harness or saddle. In 1913 J. S. McWhirter, superintendent of equipment Third Avenue Railway, New York, put the idea in practical use by devising the needed "saddle." At this time Mr. McWhirter took out a third patent which was duly assigned to the Prepayment Car Sales Company.

The Third Avenue Railway Company has used this safety device on all of its prepayment cars, which are being equipped with folding doors and steps. This covers 487 cars to date, and the railway expects to convert the rest of its rolling stock—about 1000 cars in all. By the use of this device, a car cannot be started until all the doors are closed. On new equipment, it saves the use of circuit breakers and canopy switches and prevents rapid acceleration and very materially lessens gear, pinion and motor troubles, as well as pull-ins of all kinds. The idea has long passed the experimental stage, is proving highly efficient and satisfactory on the Third Avenue System, has recently been adopted for new cars at Springfield and Worcester, Mass., and is expected to come into general use when its merits are thoroughly understood by the electric railway fraternity.

The Prepayment Car Sales Company allows its licensees to make free use of all of these patents and this device without any additional charge above the usual prepayment royalty. A special invitation is extended to engineers and mechanics to investigate the practical workings of the "Million Dollar Idea."

A THERMIT CRANKSHAFT REPAIR

Quite a remarkable crankshaft repair is being shown by the Goldschmidt Thermit Company in Machinery Hall. This shaft is 9¼ in. in diameter and was broken through one of the crankpins, near the crankweb. The fracture was opened up 1 in. by cutting away that amount of metal, then the two parts were aligned in V blocks and welded by the thermit process. After the weld was completed the shaft was placed on a planer and a large section cut out to show how thoroughly the two parts had been amalgamated by the thermit steel.

The Goldschmidt Thermit Company states that it has welded a great many such shafts for electric railways, electric light plants and refrigerating concerns and that the results have been uniformly successful. It seems that in practically all cases the breaks in the shafts are originally due to some flaw in the material. Often an old forged weld will give way in the case of built-up shafts. If the flaw is eliminated by means of a thermit weld the shaft will be better than ever, as the rest of the shaft will have been thoroughly tested while the weak point will have been discovered and remedied. Such crankshaft repairs are inexpensive and can be completed within a period of two or three days.

The company has many other exhibits of interest, as it is showing a new method for welding rails, which permits the railways to do their own welding for large jobs or small. A new model rail grinder is also on exhibition, equipped with a power derailing attachment which permits its derailment and removal from the path of traffic and replacement again in less than a minute.

NEW CONTROL SYSTEM AND PRESSED STEEL MOTORS AT WESTINGHOUSE ELECTRIC EXHIBIT

Probably the most striking feature of the exhibit of the Westinghouse Electric & Manufacturing Company is the actual operation of newly developed types PK and HL control. These control equipments operate motor racks equipped with 40-hp motors. The PK operating control head can be applied to any standard controller. The latest developments in HL control reduce the number of parts, make the form of equipment more compact, and permit a simpler arrangement of wiring. In connection with this control system a number of essential parts such as line switches, release valves, etc., are shown.

A complete line of commutating-pole motors including the box and split frame types for various voltages from 600 to 1500 are displayed aside from a preliminary sample of the new pressed steel motor and the "baby" motor developed for 24-in. wheels.

An extensive line of motor details including brush-holders, pressed steel gear case, commutators, armature and field coils, grid resistors, circuit breakers, fuse boxes, lightning arresters, and a model portable substation for rotary converter service are among other interesting features.

SIGNALS AS TRAFFIC ACCELERATORS

The exhibit of the Union Switch & Signal Company in space 133 includes a working model of the new "T.D.B." system of signaling which has enabled the Scranton & Binghamton Railway to dispense with dispatcher's orders for train movement, as described in the Electric Railway Journal for Oct. 3. By eliminating the time spent in transmitting train orders and in waiting for delayed trains against which the dispatcher has not advanced meeting points this railway has succeeded in materially increasing its schedule speed and in operating multiple-unit trains at fifteen-minute intervals in both directions. The model of the signal system that is exhibited is provided with miniature cars which may be moved in any desired manner or in accordance with any desired combination of movements, the signals changing their indications automatically just as is done under actual operating conditions. No possible sequence or combination of car movements has been found whereby two cars can get together. As the model embraces three double-ended sidings, and is completely equipped with semaphore and light signals, an excellent opportunity is afforded to railway men to study the features of protection and traffic acceleration that are provided by the signals. It should be said that the "T.D.B." or traffic direction block system was introduced only eighteen months ago, but since that time it has been installed on eight different electric railways.

WESTINGHOUSE LITERATURE AT THE CONVENTION

The Westinghouse Electric & Manufacturing Company has issued quite an elaborate lot of literature in connection with the convention as follows:

Railway Data Exchange No. 10 containing data dealing more particularly with improvements of voltage on interurban lines, effect of voltage on performance of motors, cost of stops and trailer operation, saving energy and train operation in city and interurban service. Heavy Traffic Centers, Circular 1549, shows a large number of handsome engravings illustrating the heavy traffic centers in various large cities where surface lines are equipped with Westinghouse apparatus. No. 1550, on 1500-volt direct current substation equipments, contains descriptions of different roads using this type of equipment. Maps are also given of the properties to show the territory covered, and much operating data are also included. Switchboards and accessories for use on 1500-volt d. c. lines are also illustrated and described.

Train Operation for City, Suburban and Interurban Service, No. 1546, is a collection of illustrations with brief notes showing the advantages to be derived from the use of multiple-unit trains. Several curves show the small amount of current required for a high-speed interurban car when handled in a careful manner.

Following its usual custom, the Westinghouse Company has this year issued a progress leaflet, No. 1552, in which is outlined the progress made by the company in electric railway apparatus. Among the items included are the Philadelphia terminal electrification of the Pennsylvania Railroad; the electrification of the Norfolk & Western Railway of the Bluefield Division in Virginia, and the recent addition to the New York, New Haven & Hartford Railroad.

The Westinghouse exhibit itself is described in circular 1551, with an art cover, representing "Joe and the General Manager" leaving for Atlantic City. This scheme is followed throughout the book in which they discuss the various pieces of apparatus in the Westinghouse exhibit.

PORTABLE CROSSOVERS AND MANGANESE PIECES AT WHARTON EXHIBIT

Among the new types of track work shown by Wm. Wharton, Jr., & Company this year are extra heavy switch pieces for portable crossovers, used more particularly in reconstruction work. These crossovers are of much larger radius than the old type, as they are made 75 ft. to the inside rail as against the 60 ft. radius used in previous designs. The rail used weighs 110 lb. per yard, the heaviest flat guard section rolled, while the switch pieces are of solid cast steel with pockets into which the adjoining rail is securely fastened. Two types of frogs in this construction are on exhibition, one that can be adjusted for variations of 9 in. in the devil strip and the other for use where the devil strip remains the same.

Also on exhibition are the company's well-known standard switches, the H. C. B. in solid "Tisco" manganese steel, and the H. T. in "Tisco" manganese steel keyed center construction. With these are shown different types of throwing attachments. "Tisco" manganese steel castings for use on car trucks where the wear is excessive are also on view. The "Tisco" brand is made by the Allied Taylor Iron & Steel Company, High Bridge, N. J., the only American company making manganese steel under the original patent of the inventor, R. A. Hadfield.

Beside the foregoing the company shows interesting pictures of complicated layouts, which it has furnished to roads in different parts of the country.

BRILL GRADUATED SPRING TRUCK

What is probably the newest truck in the electric railway field is the No. 76-E type of The J. G. Brill Company which is exhibited this year in the spaces where the company has been located for a number of years. This truck is a center pivotal two-motor type with the new Brill graduated spring system for light and heavy loads. This spring system originated in the Brill single motor truck No. 39-E and is the standard arrangement in that truck. It consists of a coil spring mounted on a semi-elliptic spring under each end of the bolster; the coil spring is limited to a play of ⅜-in. by means of a seat casting which contacts with the bolster when compressed that amount. When the coil springs stop acting, which occurs when the car has between half and a full load of seated passengers, the spring action is transferred to the semi-elliptics. Therefore, the lightly-loaded car body is carried on soft acting soil springs and is given a singularly smooth motion; the semi-elliptic springs being friction springs are incapable of absorbing the minor vibrations and shocks which are commonly felt in a lightly-loaded body, but are, of course, entirely suitable for the heavily-loaded body. A number of cars mounted on this type of truck with both 33-in. and 24-in. wheels are shown in an illuminated photograph stand in the booth.

Among the Exhibits

A miniature section through a boiler house is being shown by the American Engineering Company to illustrate the boiler, stoker, ash hopper, air duct, fan equipment and the proportions of a modern plant. The section is one-quarter size.

* * *

A new trolley catcher and also a new trolley retriever will be exhibited for the first time at space 328 of the Sterling Fare Register Company with which their maker, the New Haven Trolley Supply Company, is associated. The latter company also manufactures and handles the Sterling fare registers and recording fare registers.

* * *

The Yarnall-Waring Company is showing at the association convention for the first time new unloaders for both steam and motor-driven compressors. These include suction and pressure unloaders. A 4-in. starting unloader has been sectioned so that the working parts can be clearly seen. The Lea water meter, which was shown last year in operation, is again displayed.

* * *

The International Steel Tie Company is showing its new method of straight and cross-bonding track by electric welding the rails to the plate on the top of the tie and the plate to the transverse channels. This method of bonding is used with its standard track tie and makes unnecessary any other kind of bond. This practice is also shown by the Indianapolis Switch & Frog Company, which is displaying a piece of track laid on International steel ties.

* * *

A machine and chemical process for the cleaning and restoration of cane or rattan cushions is being shown by the Imperial Car Cleaner Company, Newark, N. J., in practical operation for the first time at a convention. Cushions are taken in all stages of discoloration and restored to their original brightness and cleanliness. The process is very simple and the chemicals used in conjunction with the machine can also be used by hand if desired.

* * *

The first all-light signal, operated by overhead contactors, having the official A. E. R. A. aspects is shown at spaces 117, 119 by the Street Railway Signal Company, Inc., Philadelphia, Pa. The accessibility of parts and inability to put the signals out of step by improper car operation are asserted to be special features of this company's apparatus. Its mechanical type contactors are also said to be the highest speed contactors yet put upon the market.

* * *

Among the valves which the Nelson Valve Company is showing is the Nelson-Erwood swing check and gate valve which is especially adapted for back pressure work. Another interesting valve is an iron body bronze mounted balanced control float valve which is designed to be absolutely tight. The large 16-in. steel Monel mounted gate valve is for use on high pressure superheated steam, total temperature of 800 deg. Fahr. Other valves of interest are iron-body gate, globe and throttle valves; also bronze gate, globe and check valves.

* * *

The Elastic Car Waste Company, space 576, is exhibiting for the first time at the convention sample rolls of its journal box packing made of a shape and size to fit the boxes closely. The rolls are made of carpet waste yarn adaptable to the size of the car journal boxes and are interwoven throughout with a fine brass spring wire which gives permanent elasticity and keeps it in contact with the journal bearings. It is sold in several grades. Two bearings are shown packed to give a practical idea of its application for both steam and electric railway service.

A novel type of electric railway car is shown by the Laconia Car Company opposite the entrance to the steel pier. It is the first car of this type built and is shown completely equipped. This car is of center-entrance, low-level, truckless type, and seats more passengers than any other car of its length, and the weight per seated passenger is also said to be less than that of any other car yet shown. A model is presented to illustrate the action of the non-oscillating levers, together with a model of a double-truck, center-entrance trail car seating sixty-four passengers.

* * *

The Nachod Signal Company, Inc., is showing for the first time at the convention the new A. E. R. A. light signal, using three line wires, with normally closed signal circuits, and giving indications by lights only. The light case is fitted with deep hoods and mounted for adjustment to grade and curve on a bracket bolted to a separate signal pole. The counting relay, which is of the following ratchet type, and the neutral relay are separate units mounted in an iron box made a part of the pole. The signal is demonstrated on a miniature track plan by moving cars over it at will.

* * *

Owing to the increasing interest of electric railway engineers in transmission line construction, Hubbard & Company of Pittsburgh are showing for the first time their complete line of standard pole line hardware and Peirce specialties. The new articles which include the Presteel pole, a box channel bracket arm, a forged steel feeder pin and the Steelwing screw anchor, with the Hubbard Bo-Arrow arms, forged-steel pins and a variety of fixtures and cross-arms, indicate the extent to which galvanized steel is replacing wood and cast iron in overhead line construction.

* * *

The Automatic Ventilator Company is exhibiting, in addition to its well-known line of car ventilators, a line of trolley wheels and harps, the product of the Universal Trolley Wheel Company of Northampton, Mass., for which company it is general sales agent. These wheels are of interest in that they are of the self-lubricating type, using hard grease contained in a pocket in the hub, which, by an ingenious and simple arrangement, is automatically fed to the bearing, as needed. The grease pocket contains enough lubricant to last during the life of the wheel and the user is thus relieved of the expense and trouble of wheel lubrication.

* * *

A really worth-while souvenir of the Speer Carbon Company exhibit is its book on carbon brushes issued as Price List No. 7, a title which does not do justice to its contents. It is not usual to find a catalog on carbon brushes contain more than lists of dimensions and prices. This book is an exception to the rule in explaining just how a brush should be ordered and showing how the manufacturer has classified the grades for different sets of conditions after elaborate tests to fix the electrical and physical characteristics desirable for each kind of service. The permanent record of these tests is found in the great number of load curves reproduced.

* * *

This year instead of exhibiting aluminum models the National Brake Company decided to use the actual brakes just as they are shipped out to its customers. The company has on exhibition beside the regular sizes of the Peacock brakes all the different sizes of the Peacock improved brake, the Ackley adjustable brake, and four or five designs of special brakes, several of which have never been shown before. In all there are sixteen or seventeen different brakes, the purpose being to illustrate the extent to which the company has gone in designing brakes to meet special requirements. The company also has on exhibition a full line of parts manufactured by it.

This year the Star Brass Works are showing only Kalamazoo wheels and harps, but the exhibit includes a new type of wheel 10 in. in diameter, which is shown for the first time.

* * *

The American Car & Foundry Company has handsomely furnished quarters, where visitors may rest comfortably in the vicinity of the company's exhibit of wheels as used on some of the largest railways in the United States.

* * *

The new Schutte mechanical trolley wire clamp, which is made for all sizes of round and grooved trolley wire, is meeting with considerable success, particularly for overhead trolley construction. These clamps are manufactured and sold exclusively by the H. W. Johns-Manville Company, and are exhibited at space 336.

* * *

The Globe Ticket Company is showing several improved forms of the Pope patent P. M. coupon transfer as well as other new styles of transfers and tickets which have recently been adopted by many companies. One of the most interesting of its exhibits is a unique collection of tickets of every description from all over the world.

* * *

The American Mason Safety Tread Company, space 358, is showing a fine assortment of Mason lead and carborundum filled safety treads and Karbolith sanitary car flooring, as well as its well-known self-cleaning, non-slipping Stanwood car steps. It is also presenting a new type of filled Stanwood step, which is especially designed for closed vestibule cars.

* * *

The Nungesser Carbon & Battery Company, Cleveland, Ohio, is showing a complete line of high-grade carbon brushes for traction and power-house service. These brushes are manufactured according to a new method of electrical tempering. They are reported to be giving very satisfactory operation in actual service.

* * *

The Sauvage-Ward Brake Company, New York, is displaying at space 501 a full line of automatic slack adjusters and solid adjustable bottom rods. These adjusters give an increase in shoe mileage of from 25 per cent to 100 per cent, and an absolutely uniform brake action. They eliminate the necessity of any hand adjustment, automatically taking up slack as fast as it develops. They are applicable to all types of trucks.

* * *

The Lord differential staffless brake and the new Perfected Giant brake described in the Oct. 3 issue of the Electric Railway Journal are on view for the first time at space 577. One of the noticeable gains in the differential staffless brake is its space-saving feature as only 6½ in. extended space is taken up on the car platform. The differential principle, which has never been applied to car braking heretofore, offers a simple means for obtaining any power required in the use of a hand brake. The Perfected Giant brake is said to be the lightest geared brake yet designed. One of its new features is an adjustable automatic stop to eliminate lost motion when the motorman applies the hand brake.

* * *

The Johnson Fare Box Company is showing for the first time, in connection with its standard registering fare box, a new ticket cancelling and counting device on which it has been experimenting for the past two years. This device is attached to the company's regular fare box and is operated by electric motor, so that the tickets are passed through two rolls and automatically cancelled and registered at the same time; and run into a separate compartment from the coin. The company is also exhibiting its electrically driven fare box with special examination attachment for use in elevated stations. This machine was designed for the Chicago elevated roads and has many unique features specially adapted for elevated and subway station service.

* * *

The American Brake Shoe & Foundry Company offers at the Convention the improved types of brakeheads, association standards for narrow tread and broad tread wheels. These brakeheads are of what is termed the "plate" type, which make a much stronger brakehead and give a better distribution of metal on the wearing parts of the brakehead. This construction also permits the use of a shorter brakehead key, which is desirable in many cases. The company also shows various types of association standard brakeshoes, with and without brakehead guides; also some of the flange filled composition brakeshoes, which have been successful in reducing the noise incident to the brake application, in conformity with the requirements of the Public Service Commission of the New York District.

* * *

Among the several features exhibited by the Bayonet Trolley Harp Company, Springfield, Ohio, are some important improvements in trolley base construction designed to reduce maintenance costs. It is also showing in connection with its well-known standards in detachable trolley harps some new ideas in trolley wheels and trolley axles, designed to carry a maximum amount of lubricant with provision for its proper distribution on the bearing surfaces, being especially adapted to high-speed service. "Trolley Equipment Defects and Their Remedy" is the title of a very interesting little booklet the company is giving out. This booklet presents some very important information on trolley inspection, repairs and lubrication. It is based in part on articles contributed by C. W. Squier to the Equipment and Its Maintenance department of the Electric Railway Journal.

* * *

The Jennison-Wright Company, Toledo, Ohio, a newcomer at this convention, is showing the different types of wood block for paving between street railway tracks and on bridges. Its Kreolite lug block is designed to eliminate the three objections hitherto urged against the ordinary rectangular creosoted wood block, namely, bulging, bleeding and slipperiness. The lugs on the side of each block provide a strong foothold for traffic. The lug in the center of one end of each block is wedge-shaped or pointed, so that any expansion is concentrated on the point of the collapsible lug. These features are especially desirable for paving between rails, for should the blocks expand the rails are not pushed out of alignment. Different types of nose and filler block for paving adjacent to rails are also displayed. The Kreolite Hex block is another design which is said to be superior to the usual rectangular block, especially for bridge flooring.

* * *

The "Nokoro" demonstration of the non-corrosive heater wire which has been developed after many years of careful research by the Consolidated Car-Heating Company and which is being shown at space 22 is attracting much attention. To demonstrate the non-corrosive qualities of the wire a coil of the same is shown suspended in a glass tube, and is overloaded with electric current until it runs at a red heat. The test is made more severe by a steam bath in which the red hot coil operates. A pyrometer attachment gives the coil temperature, and inasmuch as under normal operating conditions the temperature of the coil rarely exceeds 450 deg. the test shows conclusively the non-corrosive qualities of the wire, The Consolidated Car-Heating Company is using this coil as standard on all of its heaters and is also furnishing same for repairs on old heaters. A complete description of this wire was given in the Oct. 10 issue of the Electric Railway Journal.

In space 313 the Whittier Mills Company is displaying U. S. Spiral and Silver Lake waterproof trolley and signal cords.

* * *

The Universal Lubricating Company in space 370 is showing its Tulc lubricant for armature and motor axle bearings, journals, trolley wheels and air compressors. This product is furnished in six different grades in quantities of 5 lb. or more.

* * *

The "Ce-Ve" process of varnishing cars of wood and steel as well as retouching and resurfacing where the color has faded are the principal topic of conversation in spaces 574 and 575, where the Chicago Varnish Company is exhibiting. Samples of the various kinds of surfacing which are familiar to practically every railway master mechanic are also shown.

* * *

A complete line of electric specially-ground steel gears and pinions is being shown by the Edgar Allen American Manganese Steel Company at space 500. The peculiar characteristics of manganese steel are clearly shown by a sample gear and pinion which have been distorted cold without a sign of a fracture on the rim of the gear. The pinion was subjected to 245-tons pressure and the gear to 125-tons pressure to produce the results shown.

* * *

The feature of the exhibit of The O. M. Edwards Company, Inc., in spaces 519 and 420 is a trapdoor with a non-slipping tread. A diamond steel plate is used so that no floor covering is required. Among the articles shown are a metal sash with sash locks and a top tightening device; a high station platform door, giving an extension threshold; a window entirely of steel construction with the exception of the wood sill, and an all-steel desk, illustrating the company's line of all-steel office furniture.

* * *

The Trolley Supply Company, in spaces 366 and 367, is featuring its No. 5 retriever, the Simplex trolley stand and its No. 3 detachable fender. The reliability of the No. 5 retriever has been demonstrated and its principal claim is the ease of making repairs in case of a broken trolley rope. The Simplex roller-bearing trolley base is constructed on strictly practical lines and is so designed that increased tension is obtained as the pole goes up. All working parts are made of vanadium steel, case hardened, thus insuring maximum strength and long life.

* * *

Something new in trolley stands is the center of attraction at space 613 where the Wasson Engineering & Supply Company is exhibiting. This new type air retrieving trolley base has recently been developed and put on the market as an ingenious combination of the current-collecting merits of the trolley wheel and the non-jumping qualities of the pantograph for high-speed interurban work. The principal feature of this device is the combination of an air-operated receiving cylinder and auxiliary springs to maintain uniform tension when the pole is in the normal position on the wire. The major part of this base is made of cast iron but those parts which are subjected to the greatest strain are made of annealed carbon steel. Brass, bronze and leather also enter into its construction.

* * *

The great number of uses to which an electric welder may be applied are demonstrated by the Indianapolis Switch & Frog Company in space 173. The demonstrations include track welding and grinding, and reclaiming shop and rolling stock equipment. The Indianapolis electrically-welded joints and bonding plates are of special interest in this exhibit since they, in conjunction with the portable electric welder, make it possible for a road of any size to install welded joints in either large or small quantities and to apply compromise joints by a method which does not simply melt but perfectly welds without heating the rail appreciably. Already thousands of these joints are being installed by roads having the Indianapolis welder, and the joints have been thoroughly tested for several years through all changes of temperature and under all traffic conditions.

* * *

The American Lock Nut Company in space 512 is making its debut this year. This company is introducing the Absolute lock nut which has been thoroughly tested by several electric and steam railways where it demonstrated its claims. In principle the lock is somewhat similar to that of a roller clutch, consisting of a tapered recess machined on the inside of a nut so that one side of it will be closed by the bolt when the nut is in place. A small bobbin-shaped pin is set in this recess and the direction of the flare in the recess depends on whether the threading is right or left hand. In either case the forward motion of the nut carries the locking pin along with it into the deeper portion of the recess where it revolves free. If the movement is reversed the bobbin is forced toward the shallower portion of the recess where the angle is so designed that it automatically wedges the locking pin into the thread of the bolt. This locking device is made for all sizes of nuts.

* * *

The Golden Glow railway fog penetrating and non-dazzling incandescent headlights and reflectors are proving an unusal drawing card in the Esterline Company's space 318. Among the new things this company has to show at this exhibition is the type T-128 electric interurban railway headlight equipped with a dimmer for city service. Like the other headlights shown this new one is an incandescent type employing as a source of light a concentrated filament Mazda bulb of high power and intensity which is said to give a steady, uniform roadway and right-of-way illumination. The parabolic glass reflector, manufactured of glass colored so as extract the blue and violet rays, renders the golden light which gives this lamp its name and which makes its rays less blinding without detracting from the illuminating qualities. It is further asserted that numerous tests on interurban lines demonstrated that this lamp when fitted with a concentrated bulb will enable a motorman to see light-colored objects on the track a distance of 1200 ft. and dark-colored objects at 900 ft. to 1000 ft. The same size of lamp is shown with deck stand and bracket; also the Golden Glow locomotive headlight.

* * *

The Simmen speed control and automatic stop device exhibited in spaces 153 and 155 by the Simmen Automatic Railway Signal Company is certainly worthy of study. This device was shown for the first time at the National Railway Appliances Association exhibition held in Chicago last March. In general it is designed to control the movement of trains over any railroad according to a predetermined adopted maximum speed. For instance, freight trains may be limited to a maximum speed of 30 m. p. h. and passenger trains to 70 or 80 m. p. h. In either case when a train approaches a block indicating danger, the engineer is forced to lower his speed from the predetermined maximum to either zero or some minimum speed under control, say 10 m. p. h. or less as elected by the railway company. If a train enters a block and exceeds the pretermined minimum speed, the air brakes are automatically applied to bring the actual speed of the train again below the minimum. This device is also designed to control the speed of trains around curves and may be installed to inforce any particular speed established suitable for any part of a curve. This company is also showing its dispatcher's recording apparatus for automatically recording the movement of trains. This device is used with the well-known Simmen cab signals which are controlled from the dispatcher's office.

Bonney Vehslage Tool Company, New York, displays in space 328 in a neatly constructed case forty-five different styles of standard ticket punches.

* * *

Various types and designs of brakeshoes for all kinds of railway service, in conjunction with its overhead trolley switch, form the features of the Railway Materials Company's exhibit in space 535. A portion of this company's booth is fitted with attractive furniture for the comfort of its guests.

* * *

E. P. Sharp, manager of the railway department Lumen Bearing Company, Buffalo, N. Y., is attending the convention in the interest of the Ideal trolley wheel. Samples of the Ideal trolley wheel are exhibited by the R. D. Nuttall Company, spaces 140 and 144 Machinery Hall.

* * *

J. W. Griffin of the Wheel Truing Brake Shoe Company, who is one of the oldest regular exhibitors at the convention, is showing samples of his product in space 505. Not only is Mr. Griffin a familiar character but his wheel truing brakeshoe has become equally well known.

* * *

Back in its old spaces 101, 103 and 105 the Chicago Pneumatic Tool Company is attracting attention with its line of portable electric drills, grinders and portable pneumatic tools. The feature exhibits include the Duntley screwspike driving machine, along with this company's electric track drill in operation. A case of sample spikes driven by this electric driving machine on several street and interurban railways is also on exhibition.

* * *

Northern white cedar cross-ties that have been in actual service from five to twenty-nine years, and sections of cedar poles that have been in service twenty years, as well as sections of cedar poles that have been treated by the open tank process are being exhibited by the Naugle Pole & Tie Company in spaces 332 and 334. This company recently has installed an open-tank treating plant and is now prepared to sell treated or untreated cedar poles.

* * *

One of the best and most brilliantly lighted booths in Exhibition Hall is that of the Western Electric Company. The lighting here is accomplished by means of four 500-watt gas filled Type C Sunbeam Mazda lamps suspended from the ceiling. This type of lamp is commercially new this year and burns at a very high efficiency (½ watt per candle). It is manufactured in 500, 750 and 1000-watt sizes for either series or multiple burning and is adapted for either indoor or outdoor service when used with the proper fixtures.

* * *

The well-known F. C. S. brand chilled-iron car wheels for city and interurban service are being shown in various types and sizes by the Griffin Wheel Company in spaces 143, 145, 147 and 149. The combined capacity of this company's plants, which are situated in Chicago, Detroit, Boston, St. Paul, Kansas City, Denver and Vancouver, is approximately 1,500,000 wheels a year. In addition to its wheel business this company makes axles for various classes of railway service. This company is also showing its wheel grinder which is designed for use without removing the wheels from the truck.

* * *

The Eclipse Railway Supply Company at spaces 571 and 573 is showing the Eclipse trolley retriever. It is said that this retriever has been in hard service for the past eighteen months and has proved its substantial and reliable qualities. It retrieves the pole with less than a 3-in. jump and is so constructed that the tension of the springs may be readily controlled. The number of parts in this device are said to be less than in any other retriever and the maintenance cost is correspondingly decreased. In addition to this retriever the company is also showing its various types of fenders and wheel guards.

* * *

The Massachusetts Chemical Company products manufactured by the Walpole Tire & Rubber Company are exhibited in space 333. In glass containers are shown samples of Walpole shellac white; Resistolac, a permanently plastic homogeneous black insulating compound; Enamelac, a black insulating varnish for painting surface exposed to the action of acids, gases and water; Insulac, a transparent quick-drying insulating varnish; Armalac, for the permanent reinforcement of the insulation of cotton covered magnet wire in field and armature coils. Walpole friction tape and other insulating specialties are also displayed.

* * *

Hauck Manufacturing Company, Brooklyn, N. Y., is a newcomer to this convention, displaying, in Aquarium Court, various types of kerosene torches for railway work. One interesting part of the exhibit is an adjustable tire heater for expanding and shrinking on truck and locomotive steel tires. This is operated by a 12-gal. pressure kerosene tank. Another equipment of a similar nature is used for melting the spelter in repairing special track work in manganese center inserts. Preheating oil burners preparatory to electric, thermit or oxy-acetylene welding are also shown. Besides these there are exhibited various small torches for armature repairs and repair shop work.

* * *

The Van Dorn Coupler Company is showing several types of its favorably known couplers in space 533. This company has developed several new drawbar heads of the M.C.B. and automatic type during the past two or three years and is now prepared to build the best type of coupler that can be had for any service. In the latest design provision is made in the head for the automatic coupling of the air-line and electric control cables at the same time that the automatically-operated heads are coupled together. W. T. Van Dorn, the inventor of the Van Dorn couplers, which have been standard equipment on most of the leading electric railways of the country for twenty-five years, is in personal charge.

* * *

With the exhibit of the Mark Manufacturing Company the products of the National Formed Metal Products Company are being shown by J. W. MacDonald. These include a new light-weight conduit and fittings which have been especially designed for car work. In the average four-motor car the conduit weighs about 1200 lb. if of the old kind and 310 lb. if of the new. The manufacturer has developed a process by which it is possible to produce a light-weight threadless conduit on a commercial basis. He has overcome the collapsing of pipes in the cooling process, the one feature which prevented pipe manufacturers from marketing conduit of lighter weight than merchant weight in the earlier days. By this improved process no scale is formed on either the interior or exterior of pipe during its manufacture.

* * *

The Elleon Company, New York, William Wampler on board, has a great exhibit. If you like variety don't miss it. There is something of interest there also for the ladies. Bill has discovered a new metal as clear as silver, as light as wood, as strong as steel and for practical purposes as good as gold. He has samples of every conceivable size and shape for every purpose from kitchen utensils and knives and forks to car trimmings. This metal is made by the Garford Engineering Company, Elyria, Ohio, which has acquired the exclusive right for its manufacture in the United States from its originators in England. There is also exhibited by this company a fine class of white enameled car trimmings, such as has been installed on the new center-entrance cars of the Brooklyn Rapid Transit System.

The Thew Automatic Shovel Company exhibit consists of photographs, blueprints, specifications and circulars illustrating its electric shovels designed especially to meet the particular requirements of electric railways.

* * *

The General Railway Signal Company has on exhibition, in spaces 604 and 606, a photographic record of a number of continuous track-circuit installations, with both light and semaphore type signals, as recently installed on several electric railways.

* * *

American Railway Supply Company, New York, showing its line of badges, conductor punches and buttons, will be found in the Annex, space 526. It also shows, for the first time, a self-adjustable folder rack, with movable partitions, by which folders of any width may be accommodated. This is a unique feature, worthy of examination. For the nineteenth consecutive convention Walter Chur is in charge.

* * *

The Pennsylvania Steel Company has issued a special book to describe its exhibit. Thus page 7 relates to the Manard hard center frog, page 9 to the improved interior joint used by this company for all types of solid manganese crossings, pages 20 and 21 to physical testing of Mayari heat-treated chromium nickel steel and page 22 to Mayari steel shovels. With regard to the last attention is called to the economy that the way engineer can effect by the use of this type of shovel.

* * *

The Seymour portable rail grinder, exhibited in Machinery Hall by E. P. Seymour, of Waltham, Mass., is a newcomer at the convention. This is a light portable machine of simple construction for grinding corrugated rails and rail joints. Although the machine is operated by a motor it weighs less than 800 lb. and can be easily removed from the track by two men. A number of these machines are in use on electric railways in the New England States.

* * *

In addition to its regular line of products, the Dayton Fare Recorder Company exhibits a special combination fare box designed for elevated and subway stations. This device comprises its regular standard fare box equipped with special coin display mechanism to enable the operator or attendant to examine the coins more carefully before they pass from view into the fare box hopper. The company regards this as the ideal fare registering equipment for elevated and subway stations.

* * *

A first showing of an improved type of the Utility honeycomb ventilator is made by the Railway Utility Company. The metal composing the top, front and bottom of the ventilator is pressed into rows of cup-shaped louvers which are so formed that air currents passing over them from any direction cause a powerful exhaust. The ventilator is double-seamed and is galvanized after manufacture. It has no riveted or soldered seams whatever. Several varieties to suit various types of cars are shown. One type is a combined ventilator and lighting fixture in which the fixture is supported from a condulet fitting inside the ventilator.

* * *

A new register for steam and interurban service is displayed by the Ohmer Fare Register Company. This register is designed to indicate, record and print a record of fares in multiples of cents from one cent up to $10. It will meet the requirements of large interurban and steam railroad properties. It is operated by the conductor from any part of the car. This company is exhibiting also, for the first time, its tubular fare box for prepayment cars. This box is simple in construction and takes up very little space on the platform. The fares are deposited in an inner tube which is automatically locked each time it is removed from the outer casing.

Thayer & Company, Inc., space 511, are showing the Chillingworth seamless drawn-steel case commonly referred to as the "one-piece gear case" on account of each half being drawn from one piece of sheet steel, thereby eliminating seams and rivets. Aside from their new designs of bracket construction on the side-suspended cases for General Electric motors, they are exhibiting a case suspended from the ends that is used on Westinghouse motors but can also be adapted to General Electric motors. This case is entirely rivetless and is 50 per cent lighter than malleable-iron cases. Probably the most unusual case exhibited is one that has been sawed in two through the brackets, illustrating the uniformity of metal thickness of the case and the thickness and construction of brackets and reinforcing plate behind the bracket inside the case. The company is represented by G. K. Wannemacher, secretary.

* * *

During the year the Columbia Machine Works & Malleable Iron Company has added a new line to its already extensive and varied products. In space 620 in the Annex is displayed a complete line of N. W. renewable fuses and N. W. connectors. Various sizes and capacities of fuses from 50 amp 600 volts to 10 amp 600 volts; 600 amp 250 volts to 10 amp 250 volts. N. W. cable connectors of all sizes and shapes are exhibited. Of the standard line of repair shop and car equipment specialties there are on exhibition a coil-winding machine, Columbia car replacer, sectional trolley cars and ratchet brake handles. The many friends of John G. Buehler, the president of the company, will regret to learn that he is unable to be present at the convention this year. James Grady, the vice-president and general manager, and W. R. Kerschner, sales agent, are taking care of the interests of the company at the convention.

* * *

Among a general line of solid managanese track special work, the St. Louis Steel Foundry Company in space 14 is showing its special undercut steel tongue switch in both the tadpole and standard designs. The tadpole switch is designed with special provision against the loosening of the tongue under the severest operating conditions, with the resultant tendency to form a lip on the runway rail as well as to overturn under wheel pressure. This switch is cast of solid manganese ground so that the tongue fits accurately, and the heel of the tongue is so designed that a new tongue may always be fitted with the old socket in case it becomes defective. By providing an undercut socket bearing at the heel this switch conforms to St. Louis Steel Foundry Company's original design, but the bearing area has been materially increased and the tongue proper has been reinforced by a web which forms the throatway for the whole length of the tongue.

* * *

Among the new exhibitors is the Sattley Manufacturing Company, Detroit, Mich., spaces 378 and 379. This company demonstrates its various advanced coin sorting, counting and packaging machines which are designed to save time as well as reduce the cost of counting coins. These machines make possible a quick calculation of the receipts of individual conductors or lines, and eliminate disputes and discussions in regard to the correct amount of coin sent in by conductors or given them for change. The machine sorts cents, nickels, dimes, quarters and half dollars, counts them in separate denominations and packages or sacks them, as desired. The operation of the machine may be so controlled that all coins may be sacked or packaged, or any combination of these operations may be made as desired. These machines also detect and throw out mutilated coins without counting them. Money in different denominations may be placed in the machine and a count will be registered in dollars and cents, showing accurately the amount of each denomination and the sum total of all denominations.

The Curtain Supply Company's exhibit at space 638 includes various types of Ring curtain fixtures for both closed and open cars; Rex all-metal rollers, Rex steel sash balance, bulkhead sliding-door curtains, friction roller curtains, and Acme and Climax cable fixtures for open cars.

* * *

Among the exhibits of the American Steel and Wire Company in spaces 558, 559, 560 and 561, are a spindle drill electrically operated and a hydraulic compressor. A varied display is offered of electrical wires and cables, together with a right-of-way fence on steel posts, rail-bonds and a rail-bond testing apparatus.

* * *

Besides a great number of types and shapes of low voltage glass insulators the Brookfield Glass Company, New York, N. Y., features two high-voltage glass insulators, one of 33,000 volts and another of 40,000 volts. A large number of these latter types are installed on high-voltage transmission lines in California. One glass insulator of 18,000 volts is shown similar to an installation of the same type by the United States government on the Sun Reclamation Irrigation Project in Utah.

* * *

The Atlas Railway Supply Company is showing for the first time the Atlas track grinder. This grinder has been tried out by one of the railways in the Central States for about a year, and is notable for ability to operate efficiently under one man. The motor is mounted above the grinding wheel, thereby preventing all chattering. The two auxiliary wheels mounted on the motor side enable one man to remove the grinder from the track to permit a car to pass. The company also presents a complete line of rail joints, braces and tie plates.

* * *

The Lutz-Webster Company is exhibiting a full line of Lutz compression tools and the Lutz universal adjustable watertight floor box. The compression tools include a universal compression wrench for use on all finished or rough surfaces without marring or slipping. It is used in conjunction with the Lutz no-set screw lathe dog, compression ratchet, single-piece ratchet, solid and swivel arm, self-feeding drilling post and nut and bolt sockets. The Lutz floor box gives full adjustability in every direction and is perfectly watertight.

* * *

The Automatic Cashier Corporation, Norfolk, Va., is making its first convention display of the Automatic Cashier for the collection of fares. The machine is so constructed that by simply pressing a lever for the desired number of fares to be taken out of any coin inserted in the slot of the machine by a passenger, the operator delivers the change, simultaneously indicating and registering the transaction. Features of the machine are, that the machine is locked until a coin has been inserted, accepts coin for its face value only, keeps in sight the last coin inserted and ejects spurious coin.

* * *

The Bemis Car Truck Company, Springfield, Mass., has added to its exhibit of last year the Royal Worcester track broom. This is a renewable wire broom especially suited for track cleaning. High efficiency case-hardened and manganese steel brake pins are also exhibited. Samples of these pins, which have been in service for more than 100,000 miles with hardly any noticeable wear, are shown. There is a display of other manganese steel specialties such as sweeper chains, car replacers, brake levers, brake heads, bushings for brake pins and controller handles and manganese bronze check plates.

* * *

The Tool Steel Gear & Pinion Company, Cincinnati, is showing with the U. S. Metal & Manufacturing Company, New York, a collection of gears and pinions which have been in railway service for a number of years and which have made very satisfactory mileage records. One of the most interesting is a gear and a pinion from Denver, which are still good for considerable additional life after having run 191,222 miles in service where untreated pinions averaged only 45,000 miles. This is one from a set of four which went in on the original test. The rest of the material is still in service, having given the same mileage as the gear and pinion shown in the exhibit. The company is also showing an exceptionally large and heavy gear and pinion of the type being furnished to the London & South-Western Railway, London, England, for heavy electrification. The gears weigh approximately 575 lb.

* * *

The New York Switch & Crossing Company has on exhibit a number of switch pieces embodying its latest improvements in girder rail track work. Among them is its new type tongue switch for heavy service constructed of 9-in. 150-lb. rail and equipped with a universal device. The bed and tongue of this switch are manganese steel. The tongue is reinforced on both sides, has an enlarged circular heel, is absolutely pinless and is designed for the heaviest traffic. A separate tongue casting, exactly like the one in the switch, shows the beveled end and full bearing at the heel, and it is this feature which gives the switch its distinguishing character. The company also shows a girder rail mate with manganese insert, a hard center frog, iron-bound construction, and a solid manganese switch with the well-known anti-locking attachment to prevent cars straddling the track.

* * *

The new part of the exhibit of the Taylor Electric Truck Company, Troy, N. Y., is a Taylor maximum traction truck, especially designed by Mr. Taylor to meet the demand for this type of truck. The essential feature of one-half of this truck is the same as that of the Taylor M.C.B. long-base truck with the two pony wheels added. The brake rigging is hung between the wheels and designed so that the brakeshoe is applied below the center of the journal, thus eliminating the tendency in this type of truck of the small wheels lifting or creeping upward when the brakes are applied. The fulcrum of the brake leverage is equally balanced with the hang and weight of the motor. To give easy riding qualities the wheelbase is slightly longer than is customary in this type of trucks. There is also shown an M.C.B. triple-spring truck with improved inside-hung brakes and a Taylor long-base truck. Of this latter type there are 350 in use on the Boston Elevated Railway. Other parts of the exhibit are elliptic and spiral springs and a newly designed improved wrought metal bolster with adjustable chafing plates and self-lubricating center bearings.

* * *

An interesting part of the Pantasote Company's exhibit is a piece of Agasote taken from a shipment to Barney & Smith, Dayton, Ohio, two years ago. This shipment was lost in the flood. When it was found it had been water-soaked for nearly a month, but the headlining was in perfect condition and after being cleaned it was used in the construction of the cars for which it was ordered. A new composition board called Vehisote is also exhibited. This board is similar to Agasote in that it is waterproof and will not warp but it is lighter and can be used in the construction of cars where the elimination of weight is an important factor. There is also exhibited a piece of Agasote flooring which has been in service in front of one of the ticket booths of the Hudson & Manhattan tunnels. Although approximately 700,000 passengers have passed over this piece of flooring, very little wear is shown. To illustrate the flexibility of Agasote, the platform hood of a car is shown. This part of the exhibit also shows how Agasote can be used for the roof of a car as well as headlining and interior finish. The rest of the exhibit comprises car seats upholstered in Pantasote and Pantasote for car curtains.

The Pittsburgh Steel Company is exhibiting at spaces 162 and 164 a sample of its galvanized wire fencing, a more heavily-coated style of which has recently been put on the market. This company is also displaying an ornamental station ground fencing with rounded top.

* * *

The exhibit of the National Lock Washer Company, space 539, consists primarily of models of car curtains, curtain fixtures, sash locks and sash balances for all types of electric railway cars. There are also shown National lock washers for trucks, motors and track and Hipower nut locks for track.

* * *

The Rail Joint Company, spaces 350 to 357, has a full line of the well-known Wolhaupter, Continuous and Weber joints. The very large booth is fitted up for demonstrating the various kinds of joints, and for making the friends of the company comfortable. As is well known, the Continuous joint will be used on the track of the new subways in New York City.

* * *

The Railway Track Work Company is back in its old location at spaces 161 and 163, where it is showing its well-known reciprocating track grinder in operation. This machine is built in a rugged manner with the aid of the best materials and workmanship. A feature of merit in this machine is the facility with which it may be employed in removing corrugations on curves.

* * *

Space 611 used by the Watson-Stillman Company shows hydraulic machinery, including a 125-ton girder rail bender, a 3000-lb. telescopic motor-lift jack, a 20-ton wrecking jack with a removable claw and photographs of tools suitable for shop use. An interesting feature is the emergency car jack designed to meet the requirements of the Pennsylvania Public Service Commission law for use on city cars.

* * *

Although without an exhibit this year, W. J. Jeandron is attending the convention in his own interests, as United States agent of Le Carbone Company of Paris, France. He has recently returned from Europe and states that war conditions in Europe have in no way affected the production and shipment to this country of carbon brushes in ample quantities to take care of his extensive business in American railway and lighting industries.

* * *

A combination anti-slip and open-work type of car step tread is a new feature of the Universal Safety Tread Company's exhibit at space 568. The open-work rear of the tread has all its metal intersections locked, thus eliminating the possibility of springing open. The front part of the tread is composed of a homogeneous none-slipping mass, rather than of vertical steel ribs, so that wearing off of the surface does not in any way decrease its abrasiveness.

* * *

Among the newcomers in the electric railway field, yet well known to steam roads, is Edwin S. Woods & Company, in space 537. This company is exhibiting its anti-friction, flat-sided, ball-center bearing. This unique mechanical combination gives ample travel and two and one-half times more carrying capacity than the use of full-sized roller or ball bearings. A side-bearing with a support feature which takes lateral thrust when the car is riding on tangent track and provides a roller bearing on curves is also shown. Both of these devices result in an easier riding car and a saving in rail and wheel flange wear.

* * *

Drouvé "Anti-Pluvius" puttyless skylights are to be used on the Superior Avenue shops of the Cleveland (Ohio) City Railway. This, together with the Harvard Road Shop group, for which an additional order was also placed, makes a total of more than 50,000 sq. ft. on these buildings. In the Holyoke Street Railway new shops, now nearing completion at Holyoke, Mass., about 1000 lin. ft. of "Straight Push" sash operator has been installed. Other contracts now being finished are additional Drouvé skylights for the Boston Elevated Railway, Stone & Webster Engineering Corporation, H. M. Byllesby & Company, Chicago City Lines and an order for 10,000 sq. ft. for the new shops of the Springfield (Ohio) Railway.

* * *

Consolidated Car Fender Company, Providence, R. I., is using space 589 in the Annex to show its Type A and Type C extension fenders, the H. B. and the Providence life guard and the Mellen snow broom. Several important improvements were made in all of these equipments last year as described in the Oct. 15 issue of the Electric Railway Journal Daily last year. It is interesting to note the popularity of the H. B. life guard for city service. All the city surface cars in New York, Brooklyn, Philadelphia, Chicago, Buffalo and many other cities are equipped with these guards. More than 94,000 equipments are now in daily service in the United States, and more than 200 foreign systems are also equipped with H. B. guards.

* * *

Interest in track special work in the Cleveland Frog and Crossing Company's spaces 585 and 587, is centering on the new types of rail-bound, solid manganese center interurban frogs and switches. In this construction standard 80-pound A. S. C. E. rail is so formed and bolted to a solid manganese steel insert as to permit a very easy approach to a wheel flange bearing at the intersecting flangeways. The depth of the insert eliminates peening or cold rolling, and any of the parts are readily renewable in case failures occur. This company also is exhibiting for the first time the Cleveland motor-driven splice-bar off-setting machine with a range to meet practically any track condition. This machine is similar in principle to this company's well-known hand-power machine.

* * *

The Pyrene Manufacturing Company, space 215 Aquarium Court, has an exhibit designed to demonstrate not only the fire extinguishing properties of Pyrene but also its electrical non-conductivity. The former is demonstrated by means of a large 550-volt, 100-lamp arc which is broken with the liquid. The latter quality is shown by the operation of an electric motor submerged in Pyrene and by an incandescent lamp with all of its terminals submerged. An effective mechanical sign, duplicates of which are in operation all over the country, shows a man extinguishing an automobile fire. Among other exhibits are samples of the latest tamper-proof box for holding extinguishers, the latest types of brackets for attaching extinguishers to cars, and a complete assortment of the parts of the extinguisher.

* * *

The L. S. Brach Supply Company, at space 141, has on exhibition an automatic flagman for crossing protection and samples of the smaller products of the company. It also shows the Brach "Hydro-Ground" consisting of a number of metal bowls with perforated tops mounted on a stem, and designed to create a moist area for grounding. A lightning arrester and static discharger, together with various fittings, are shown in attractive form. A feature of particular interest is the track contact device, which was designed primarily for the control of the automatic flagman and which is also used for announcing trains, etc. It is operated by the depression of the rail under the weight of the car. The box rests on the ties and a finger hooks under the rail operating a switch through a train of levers. One hundred of the automatic flagmen are already out, some of which are on the Public Service Railway, the Scranton & Binghamton Railway, the Long Island Railroad (where it is used in connection with the signal system) and others.

In space 330 the Fonger Fender Company is demonstrating the reliability and effectiveness of the tip-tilting car fender. The claims for the fender are light projection, neat appearance, durable and substantial construction, light weight and adjustability for any type of car.

* * *

A new type 10-ft. air-brake compressor of a design distinctly new from those formerly shown is being exhibited this year in space 15 by the National Brake & Electric Company. This company is also showing a general line of apparatus for railway air-brake and industrial service, all of which is attracting many visitors.

* * *

The United States Wood Preserving Company has on exhibit at space 107 a sample block taken from a section of wood block pavement which was laid down fourteen years ago on Fremont street, Boston, and which now shows a wear of only ⅛ in. Another block, taken from Warren street, New York, shows a wear of only ¼ in. after eleven years of service.

* * *

The Prince-Groff Company, a newcomer at the convention, is featuring in spaces 384 and 385 an interesting line of drills, including power driven "Wedglock" track drills, hand-track drills and hand-signal drills. The exhibit also includes "Kwikgrip" pipe wrenches with straight jaws and the "Pressurlockd" water-gage system, complete with gage, valves, connections to boiler and lamp bracket.

* * *

Among the new things being exhibited in spaces 154 and 156, where the Schutte & Koerting Company is located, is an air washer and cooler for generator sets. In this air is drawn through a pair of spray nozzles to a set of baffle plates which serves to remove the moisture. This device is made for any size generator desired. This company is also showing for the first time its multiple jet condenser.

* * *

Valentine & Company, spaces 580 and 581, present the results of a number of tests of Valspar and other varnishes designed to show the qualities of the company's product. A large number of test samples are shown and one test is under way during the convention. Exhibits of the Valentine car painting systems, showing the results of the application of successive coats, and of enameled signals, form an interesting part of the display.

* * *

The Electric Railway Improvement Company, spaces 570 and 572, is showing a new oil furnace for melting copper used in the installation of rail bonds, negative feeders and return circuits. The apparatus is light and portable and is especially adapted for work on steam roads under electrification when electric power is not available. Any size bond or cable may be installed by this method, which gives the apparatus a very large range of usefulness.

* * *

Although the Morgan Crucible Company, Ltd., London and New York, has been in business in the United States for five years, it is making its first extensive exhibit at this convention. The booth in Machinery Hall is attractively decorated. One of the features of the exhibit is a very large piece of natural pure graphite dug out of one of the company's mines in Ceylon, India, and shipped direct from there for exhibit at this convention. A special display is made of EG3 electro-graphitic Battersea traction brushes; Morganite brushes for generators, copper-filled brushes for collector rings and Battersea screwless connectors. Gland packing graphite rings for the steam and boiler room are also exhibited.

* * *

The specialty exhibited by the Albert & J. M. Anderson Manufacturing Company in spaces 374 and 375 is the Lindall brush-holder, which has the following advantages: better commutation and reduced motor flashing, constant brush pressure, no pig-tails, ease of inspection and renewal and economy of maintenance. The company is also displaying an alligator jaw testing clamp for us in testing watt-hour meters, insulating sleeves made of Aetna insulation for covering incoming conduits, an Anderson-Little switch for controlling light and heating currents and giving a quick break at two points, and a lock type of disconnecting switch for high-tension compartments.

* * *

Richard Russell, Toronto, Canada, and Niagara Falls, N. Y., has an interesting exhibit in Machinery Hall. During the year he has made a number of improvements on his trigger-lock reversible controller fingers. The fingers are more pear-shaped than formerly, giving them a better contact surface. One part of the exhibit is a 35-K controller equipped with trigger-lock reversible controller fingers. The interchangeability of the fingers and the quickness with which they can be changed is shown. All the electric railways in Canada use these fingers on their controllers, and more than 400 roads in the United States are now employing them. Most of the business done is in repeat orders.

* * *

A new type, light-weight seat and a vertical wheel brake requiring minimum platform space make up the principal features of the St. Louis Car Company's exhibit in space 588. This seat is much lighter than former designs, the weight reduction being accomplished by the use of sheet-steel pressings. Extra seating space of 1 in. is also obtained by the use of an especially designed reversible mechanism which is three-prong with a self-setting feature and also provides a positive stop. In addition to the small amount of space occupied by the vertical wheel brake, this type avoids the danger to passengers when a set brake comes loose. At the same time, the diameter of the wheel and the transmission gearing give the motorman greater purchase and a flywheel action.

* * *

The Gold Car Heating & Lighting Company, spaces 306 and 308, has a working exhibit showing the operation of the thermo control for electrical heaters designed to economize current. The exhibit is designed to particularly attract attention to the ventilated porcelain cores of the heaters by means of which wire temperatures are kept down, and to the coils which are wound of Gold's standard non-corrosive wire. The Fahnestock clip connector is used on a number of heaters to permit the easy removal of units. For use on the older heaters a new ventilated porcelain core has been substituted for the enameled rods previously used. Samples of this are shown. Other exhibits include covers for the new 1200-volt heaters, designed primarily to protect the public and the Cyclone induction ventilator as used on the New York, Westchester & Boston Railroad, the Baltimore & Ohio Railroad and others.

* * *

S. K. F. ball bearings are exhibited at space 532 this year for the first time. This exhibit consists of a pair of 33-in. solid steel wheels and axle mounted on S. K. F. self-aligning ball bearings. The journal boxes are made of cast-steel and are designed for use on the Standard Type 0-50 Truck. The bearings are made in Sweden and are so designed that the two rows of balls run in a spherically-ground outer raceway. Two bearings are used in each journal; the outside bearing, while it has the same outside diameter as the inner bearing, is heavier, has larger balls, a slightly smaller bore, and in addition to taking its proportion of the radial load carries all of the thrust in one direction. These bearings have been successfully adopted in Europe on the journals of heavy railway cars and tramcars. The S. K. F. people are also showing an assortment of heavy bearings suitable for railway work, and several sizes of ball bearing shaft hangers for use in railway shops.

List of Exhibits

The exhibits at the American Electric Railway Association at Young's Pier are so arranged that a systematic trip can easily be made to see them all. The best route for a delegate to take is that leading to the right into Machinery Hall directly upon entrance from the Boardwalk. Here, ranged on the left and right sides respectively, will be found booths 104-164 and 100-163. Turning the corner then, past the aquarium on the left and booths 173-211 on the right, the delegate will find his way into the right hand aisle of Exhibition Hall, past booths 301-337 and 351-387. An incline at the end of this aisle leads into the Annex Court, from which another incline, leading backward, opens into the Claim Hall and the Accountants' Hall. Going ahead from the first incline, however, the delegate will see exhibits 405-543 on his right and 547-589 on his left on the right-hand aisle of the Annex. Around the corner to the right from booth 543 in the Hotel Men's Annex, in booth 603, will be found a gentlemen's smoking and rest room. In the rear, right-hand corner in booth 614, is the ladies' reception and rest room. Turning to the left at this point, the delegate comes to the entrance on his right, which he may take in getting out to the Greek Temple, the home of the American Association, or farther out to the Engineering Hall. The exhibits, however, lead straight ahead, and with the first turn to the left the trip back on the other side of the pier is begun—past booths 612-602 and 634-626 in the Hotel Men's Annex. Booths 540-500 and 500-546 in the Annex, and booths 330-300 in Exhibition Hall. At this point the aquarium is passed on the other side and the delegate may wander down the side aisle of the Main Building past booths 18-2, or else first visit booths 24-20 in the center and 19-15 on the opposite side or vice versa, and thus find himself back at the main entrance from the Boardwalk.

Abrahams & Company, S., Philadelphia, Pa., space 323, Exhibition Hall. Uniforms. Represented by William Abrahams, Simon Abrahams, Louis A. Hirsch, Julius Weintraub.

Acme Supply Company, Chicago, Ill. Regal revolving curtain box, Crown and Gem pinch handle curtain fixtures, Kass safety step treads, duplex weather proof windows, car fittings and supplies, including full size metal doors and trims for New York Municipal subway cars. Represented by Stanley W. Midgeley, H. V. Morton, Mr. Munro.

Allen American Manganese Steel Company, Edgar, Chicago, Ill., space 500, Annex. Electric special ground gears and pinions of manganese steel for railway motors; also samples of material showing peculiar hardness, toughness and wearing quality of "Stag" brand manganese steel. Represented by Walter H. Evans, Walter S. McKee, W. G. Nichols.

Alloy Steel Forging Company, Pittsburgh, Pa., space 569, Annex. Forged manganese steel chafing plates, pedestal gibs, suspension horn wear plates, brake pins, locomotive spring hangers and draw-bar coupler yokes, steam shovel friction band strap, chain parts, woven manganese steel screen, rolled manganese steel T-rail. Represented by W. S. Potter.

American Brake Shoe & Foundry Company, Mahwah, N. J., space 416, Annex. A. E. R. A. Standard brake heads and brakeshoes. Represented by F. W. Sargent, E. B. Smith, E. L. Janes, C. P. Wright, A. G. Delaney.

American Car & Foundry Company, Chicago, Ill., space 619. Special cast iron chilled wheels. Represented by Messrs. Blewett, Eaton, Wilson, McDowell.

American Engineering Company, Philadelphia, Pa., space 12, main building. The Taylor stoker. Represented by E. G. Marble, general sales manager; M. Alpern, assistant sales manager; R. O'Shea, C. E. Harrison.

American Lock-Nut Company, Pullman, Chicago, Ill., space 512. Lock-nuts. Represented by Fred M. Bobo, H. W. Radcliffe.

American Mason Safety Tread Company, Lowell, Mass., space 538. Mason safety treads, Karbolith flooring, Stanwood steps, ladder shoes. Represented by Henry C. King, president; Ralph C. Davidson.

American Railway Supply Company, New York, N. Y., space 526, Annex. Cap badges, coat convention badges, police shields, self-adjusting timetable and folder rack. Represented by Walter Chur.

American Steel & Wire Company, Chicago, Ill., spaces 558, 561. Rail bonds, electrical wires and cables, right-of-way fence on steel posts, four-spindle drill electrically operated, rail-bond testing apparatus, hydraulic compressor. Represented by B. H. Ryder, F. A. Keyes, C. S. Knight, R. C. Moeller, Henry Rose.

Anderson Manufacturing Company, Albert & J. M., Boston, Mass., spaces 374-375. Overhead line materials, rotary sand boxes, Lindell brushholders, motor-operated end cell switch, Anderson automatic time switches, contact rail insulators, special switches for railway service, etc. J. M. Anderson, A. E. Anderson, A. H. Burns, J. F. Stout, Ernst Woltmann, G. B. Crane, W. W. Hincher.

Atlas Railway Supply Company, Chicago, Ill., spaces 502-504. Atlas rail joints, Atlas compromise joints, Atlas, special joints, Atlas tie plates and braces, Atlas guard rail braces, Vixen rail planer, and a demonstration of a new track grinder. J. G. McMichael, Daniel Thomson.

Automatic Cashier Corporation, The, Norfolk, Va., space 525, Annex. Automatic cashier. Represented by J. F Hibner, E. J. Hibner, Paul Garrett.

Automatic Ventilator Company, New York, N. Y., space 317, Exhibition Hall. Ventilators for monitor and arch roof cars, self-lubricating and renewable trolley wheels, trolley harps and renewable contact springs. George H. Ford, Wm. J. Fleming, Jr., F. J. Hayez.

Auto Utilities Company, Chicago, Ill., space 316.

Bayonet Trolley Harp Company., Springfield Ohio, space 511, Annex. Trolley bases with detachable pole clamp, detachable trolley harps, Bayonet special trolley wheels, sleet cutters. Bayonet self-lubricating trolley axles. Represented by Messrs. Olinger and Garlough.

Bemis Car Truck Company, Springfield, Mass., space 503. Case-hardened brake pins, case-hardened bushings, trolley pins, manganese steel castings, Vim bronze bearings, brake-heads, brooms (wire and corn), etc. Represented by Warren L. Boyer, Theodore S. Adams, David L. Beaulieu.

Blake Car Step Works, Inc., The, Charlotte, N. C., space 600. Blake safety car step, for Interurban and steam railway coaches. Represented by John S. Blake, W. W. Watt and Fred D. Blake.

Brach Supply Company, L. S., New York, N. Y., space 141, Machinery Hall. Brach automatic flagman, Brach vacuum and non-air-gap lightning arresters. Hydro-ground cable boxes, track contacts and signal accessories, Solderall and Solderall torch. L. S. Brach, G. Gort.

J. G. Brill Company, The, Philadelphia, Pa., space 8, Main Building. Radiax El Truck, No. 76-E two-motor pivotal truck, solid forged side frames, center plates, wide-wing journal box, half-ball brake hangers, car seats, motormen's seats, twill-woven cane, lined and unlined. Represented by S. M. Curwen, J. W. Rawle, W. H. Heulings, Jr., G. M. Haskell, A. N. Hargrove, R. B. Liddell, J. E. Brill, F. L. Markham, H. A. Heulings, W. S. Adams, W. M. Smith, M. J. Oswald, C. J. McPherson, J. H. Ohlsson, D. B. Dean, G. H. Tontrup, E. Bronenkamp, C. F. Johnson, S. M. Wilson.

Brookfield Glass Company, New York, N. Y. Insulators. Represented by H. C. Law, Arthur Lockwood.

Buda Company, The, Chicago, Ill., space 311, Exhibition Building. Models of track special work, frogs, switches, crossings, etc., photographic illustrations of completely assembled intersection layouts. Represented by H. S. Evans, S. G. Llewellyn, R. B. Fisher, F. W. Marvel, George K. Reel.

Carnegie Steel Company, Pittsburgh, Pa., spaces 546 to 553 inclusive, Annex. Piece of street railway track, illustrating method of placing steel cross ties in concrete: Duquesne rail joints, Braddock insulated joints; heavy steel cross tie, same as those on which test is being made by Pennsylvania Railroad; rolled steel wheels for interurban and other street railway service; rolled steel gear blanks; finished gears; steel sheet piling. Represented by W. P. Siebert, L. C. Lustenberger, Robert Coe, N. B. Trist, T. W. Williams, W. W. Scott, Jr., N. M. Hench, H. P. Tiemann, L. W. Conroy, R. W. Steigerwalt.

Cheatham Electric Switching Device Company, Louisville, Ky., space 159. Automatic electric switching device, designed to operate switch points by motorman from his controller without having to stop car. Represented by E. S. Olmsted, J. D. Augustus.

Chicago Pneumatic Tool Company, Chicago, Ill., spaces 101-103-105. Duntley portable electric tools, consisting of portable drills, grinders, track drills, spike drivers, track grinders and portable pneumatic tools of the Boyer and Keller types. W. O. Duntley, Thomas Aldcorn, C. B. Coates, J. W. Smith, F. S. Eggleston.

Chicago Varnish Company, Chicago, Ill., spaces 574, 575. Examples of CeVe process finishes on wood and steel. Represented by Messrs. Bigelow, Gundrum, Buckman, Porter.

Cleveland Frog & Crossing Company, Cleveland, Ohio, spaces 585 and 587, Annex. Track special work and motor-driven splice offsetting machine. Represented by George Stanton, L. G. Parker.

Columbia Machine Works & Malleable Iron Company, Brooklyn, N. Y., space 620, Hotel Men's Annex. Automatic winding machines, standard armature and field coil winding machines, standard and renewable fuses, copper connection terminals, car replacers, brake handles, controller handles, trolley line material, knife-blade switches, bearings, commutators. Represented by J. G. Buehler, James Grady, W. R. Kerschner, M. R. Jarvis.

Consolidated Car Fender Company, Providence, R. I., space 589, Annex. Street car fenders and life guards. A. J. Thornley, George H. Hollingsworth, H. E. Oesterreich.

Consolidated Car-Heating Company, Albany, N. Y., space 22, Main building. Electric heaters and switches for 600-1800 volt operation, heater ventilating units, thermostatic control of car heaters, signal systems, highway crossing signals, gong ringers, emergency lighting relays, special jumper plugs and sockets, push-button switches, pneumatic and mechanical door operators, special relays and contactors, tilting heat deflectors, trap door operators. Represented by Thomas Farmer, Jr., C. C. Nuckols, H. L. Hawley, G. E. Oakley, W. S. Hammond, Jr., J. H. McElroy, C. A. Eggert, F. Avery.

Cooper Heater Company, The, Carlisle, Pa., space 325, Exhibition Hall. Forced ventilation hot-air car heaters and pressed-steel hot-water car heaters. Represented by W. Stuart, Caleb S. Brinton, Thomas MacDonald, Thomas Green, Jr.

Curtain Supply Company, The, Chicago, Ill., space 638, Hotel Men's Annex. Car curtains, ring curtain fixtures, Rex all-metal curtain rollers, curtain materials, Rex sash balances, Rex friction curtain rollers, etc. Represented by R. F. Hayes, Eastern manager; G. E. Fox, Eastern and Southern representative; F. M. Egolf, Southwestern representative.

Dayton Fare Recorder Company, The, Dayton, Ohio, spaces 386-387. Dayton fare recorder, Dayton registering fare boxes, Dayton combination fare-box recorders, Dayton special combination fare-box recorders for elevated and subway stations. Represented by Will I. Ohmer, P. J. Mitten, D. B. Whistler.

Joseph Dixon Crucible Company, Jersey City, N. J., space 16. Graphite products, including lubricating graphites, graphite grease, boiler graphite, silica graphite paint, crucibles, foundry facings, dynamo brushes, belt dressings, etc.; the products in a crude and finished state; also a set of gears which have run more than 300,000 miles with Dixon graphite wood grease only. H. W. Chase, W. M. Willitts, J. A. Condit, L. H. Snyder.

Drew Electric & Manufacturing Company, Indianapolis, Ind., space 315, Exhibition Hall. Overhead line material, car equipment and safety devices, including Samson trolley splicers and splicing ears, protective and reclaiming sleeves for iron poles, motorman's safety mirror, Samson pipe insulators, overhead switches, crossings, clinch ears, adjustable trolley crossings, section insulators, linemen's tools, high-tension insulators. Represented by James H. Drew.

G. Drouve Company, The, Bridgeport, Conn., space 607, Annex. Anti-pluvius puttyless skylights, straight-push sash operator, Lovell window operator (regular and dreadnought). Represented by William V. Dee, Earl H. Hauserman.

Duff Manufacturing Cimpany, Pittsburgh, Pa., space 637. Street car emergency jacks, genuine Barrett track and automatic lowering jacks, Duff high-speed ball-bearing screw jacks, Duff-Bethlehem hydraulic jacks. Represented by E. A. Johnson, C. A. Methfessel.

DuPont Fabrikoid Company, Wilmington, Del., space 307. Fabrikoid car window material, Fabrikoid car seat upholstery material. Represented by C. Hallock Silkman, H. W. Wivel.

Eclipse Railway Supply Company, Cleveland, Ohio, spaces 571-573, Annex. Eclipse life guard, Eclipse wheel guard, Acme fender, Eclipse trolley retriever. Represented by Ross Forward.

O. M. Edwards Company, Inc., The, Syracuse, N. Y., spaces 591, 521, Annex. Window fixtures, sash balances, metal sash, metal extension platform trap doors, shade rollers, padlocks. O. M. Edwards, W. A. LeBrun, E. F. Chaffee, C. H. Rockwell, T. P. O'Brian, W. C. Bradbury.

Elastic Car Waste Company, Philadelphia, Pa., space 576, Annex. Patented elastic car waste of carpet yarn interwoven with fine brass spring wire for journal boxes. Represented by Frank B. Birch, president, Arthur B. Birch, William S. J. Wetherill.

Electric Railway Improvement Company, Cleveland, Ohio. spaces 570-572, Annex. Electric weld rail-bonding car in operation, coal oil furnace for copper weld rail bonding, rail bonding apparatus. Represented by Stanton. Howatt, Schmid, Rinker, Huber.

Electric Railway Journal, New York, N. Y., space 7, Building No. 1. Reception booth and office of Convention Daily. On display and for distribution: copies of Convention Number, Convention Daily and regular weekly editions. Other publications of McGraw Publishing Company on display are: *Electrical World; Engineering Record; Metallurgical & Chemical Engineering; McGraw Electrical Directories* (Electric Railway and Lighting & Power editions); *McGraw Electric Railway Manual* (Annual Red Book); and *Electric Railway Dictionary*. Represented by Messrs. McGraw, Wilson, Henry, Kucera, Blake, Norris, Babtiste, Beard, Hunt, Gould, Kingsley, Jackson, Henley, Haas, MacMurray, Bruster, Grinnell, Schoch, Coburn, and Misses Vannett and Johnson.

Electric Service Supplies Company, Philadelphia, Pa., space 414, Annex. Keystone car destination signs, Garton-Daniels lightning arresters, Keystone truss pins, Locke insulators, Keystone triangle cross arms and fittings, Keystone trailer connectors, lamp guards, Never-Creep guy anchors, Peerless universal armature machines, Melo-Beam incandescent headlights, Keystone steel gear cases, Keystone motorman's seats, Samson spot cordage, Safety car lighting fixtures and other new electric railway specialties, most of it in actual operation. Represented by C. J. Mayer, A. H. Englund, J. W. Porter, J. V. E. Titus, W. A. Armstrong, Jr., W. J. Bryan, G. W. Cox, L. H. Pike, H. G. Lewis, J. R. McFarlin, T. F. McKenna, T. H. Henkle, F. C. Peck, G. E. Watts.

Electric Traction, Kenfield-Davis Publishing Company, Chicago, Ill., space 10. Reception booth. Represented by W. J. Field, H. E. Ross, H. J. Kenfield.

Electro-Mechanical Brake Company, West Bromwich, England, space 610. E.M.B. unbreakable jointless grid resistances for traction and industrial work; specimens of the equipments used by the London County Council, Birmingham, Adelaide and other street railways, as well as a typical resistance as used by the British Admiralty, iron and steel works, etc. The resistances will be shown on test. Represented by A. W. Maley.

Ellcon Company, The, New York, N. Y., spaces 536-538. Safety control interlocks, car height adjuster device, porcelain enameled pipes and fittings, switches, conduit fittings, Aero metal castings, Aero metal in sheet and cast form, ball-bearing door hangers. William Wampler.

Esterline Company, Indianapolis, Ind., space 318, Exhibition Hall. Golden Glow fog penetrating, non-dazzling railway headlights; locomotive headlights; marine and emergency wagon searchlights; Golden Glow mirrored glass reflectors; Esterline graphic efficiency recording instruments. W. McK. White, sales manager; F. O. Grayson, St. Louis, Mo.; E. R. Mason, New York, N. Y.

Federal Signal Company, Albany, N. Y., space 131, Machinery Hall. Automatic signals, a. c. and d. c. bottom post and top post types; three-position light signal; single-phase and polyphase relays; neutral, interlocking and polarized relays; track transformers; switch circuit controllers and switch indicator; reactance bonds, etc. J. T. Cade, J. W. Hackett, M. H. Loughridge, J. F. Kelly.

Flood & Conklin Company, Newark, N. J., space 18. Simplex system for finishing wooden and steel passenger equipment. Represented by L. Atwood Williams.

Fonger Fender Company, Chicago, Ill., space 330, Exhibition Hall. Fonger tip-tilting automatic fender mounted on a truck on wheels to be pushed against a live person every few minutes to show how it will pick him up automatically without the slightest injury. Represented by Robert V. Fonger, Malcolm W. Fonger.

Galena-Signal Oil Company, Franklin, Pa., space 24, Main building. No exhibit, but will have a reception and tea room. Represented by C. C. Steinbrenner, vice-president; E. H. Baker, second vice-president; G. A. Barnes, assistant manager electric railway department; E. V. Sedgwick, C. H. Thomas, W. A. Trubee, L. R. Speare, C. A. Record, L. J. Drake, Jr., W. A. McWhorter, E. G. Beatty, R. H. Craig, A. O. Fletcher, J. C. Glair, A. Green, W. H. Lee, W. A. Love, George J. Smith, W. O. Stieff, J. E. Southwell, W. C. West, D. A. J. Sullivan, H. C. Mason, W. H. Pape.

General Electric Company, Schenectady, N. Y., space 20, Main building. Six types of commutating pole motors, comprising; G.E.-239 rated 1200-2400 volts, 150 hp G.E.-240 motor, rated 600-1200 volts, 80 hp G.E.-242 motor, rated 65 hp at 600 volts and 55 hp at 500 volts, G.E.-243, 600-volt motor, G.E.-248 motor rated 160 hp at 600 volts, G.E.-247 motor rated 35 hp at 600 volts and 30 hp at 500 volts; M.K. control for operating four 30 hp motors; four types of K controllers including the new K-201; combined straight and automatic air brake equipment with CP-27-B compressor; CP-25-C, 600 volt new light weight compressor; line materials, part as installed in service; display boards of air brake details, circuit breakers, fuse boxes, rheostats, etc.; forged steel treated gears and cast-steel split and solid gears with forged steel treated pinions; sheet-steel gear cases; complete line of headlights; exhibit of modern car lighting including boron car lighting regulator outfit and boron filament lamp, tungsten registers, etc.; lantern slide exhibition showing progress in electric railway field during the past year. Represented by J. G. Barry, W. B. Potter, F. E. Case, G. H. Hill, E. D. Priest, C. E. Eveleth, J. F. Layng, W. T. Stanton, E. P. Waller, W. G. Carey, F. H. Gale, W. J. Clark, S. W. Trawick, C. B. Keyes, W. H. Sigourney, H. C. Grier, C. C. Pierce, C. E. Sprague, R. E. Moore, R. P. H. Staub, W. A. Woolford, E. H. Ginn, H. L. Monroe, C. A. Ives, J. A. Cranston, O. E. Turner, L. W. Shugg.

General Railway Signal Company. Rochester, N. Y., spaces 604, 606. Photographic record of block signal installations using continuous track circuit with both light and semaphore type signals. Represented by H. M. Sperry, S. M. Day, H. W. Lucia, W. W. Coleman.

General Vehicle Company, Inc., Long Island City, N. Y., space 603. Two-ton emergency wagon (electric), one-ton industrial truck (electric). Represented by F. Nelson Carle, F. B. Fink, J. R. C. Armstrong.

Globe Ticket Company, Philadelphia, Pa., spaces 380, 382. Transfers, cash fare receipts, tickets in book form, strips, rolls for city and interurban electric railways. Pope patent p. m. coupon transfers, ticket punches. Represented by W. C. Pope, P. C. Snow, R. C. Osman, E. Elliott, C. Elliott, C. W. Zieber.

Gold Car Heating & Lighting Company, New York, N. Y., spaces 306, 308, Exhibition Hall. Ventilated core electric heaters, thermostatic control for electric heaters, electric thermostatic control for steam heating, Cyclone ventilators. Represented by F. H. Smith, A. B. Strange, F. T. Kitchen, F. O. Bailey.

Goldschmidt Thermit Company, New York, N. Y., spaces 114, 116, 118, 120, 13, Machinery Hall and Main Building. Improved apparatus for making Thermit insert fully welded rail joints from start to finish; sample welds of rail joints, crank shafts and other sections; Goldschmidt thermit rail grinder with power derailing feature in operation on track; a full line of metals and alloys free from carbon and thermit pipe welding materials. Wm. C. Cuntz, general manager; F. W. Cohen, chief engineer; W. R. Hulbert, sales manager; H. S. Mann, H. D. Kelly, J. G. McCarty, William Aldrich.

Griffin Wheel Company, Chicago, Ill., spaces 143, 145, 147, 149, Machinery Hall. Chilled iron car wheels, F. C. S. wheels for city and interurban service. Represented by A. A. Hale, H. N. Scott, A. W. Brown, W. A. Bennett.

Hale & Kilburn Company, Philadelphia, Pa., spaces 407, 409, Annex. Pressed steel Walkover seats for city and interurban cars; steel interior car finish; steel integral window construction; steel car doors, mouldings and other pressings for steel cars. Parlor car chairs; rattan seat covering; 40 ft. section of steel car interior, complete from floor to roof equipped with Walkover steel seats as supplied for every first-class steel passenger car used in the United States. Represented by A. F. Old, C. W. Laskay, R. H. Pilson, F. C. Edson, F. R. Robb, J. K. Hoffman, I. Lubersky, W. F. LaBonta.

Harrison Safety Boiler Works, Philadelphia, Pa., spaces 158, 160, Machinery Hall. The Cochrane metering heater, Cochrane precision meter, Sorge-Cochrane hot process water softening system, Cochrane multifort safety exhaust outlet valve, Cochrane multifort flow valve, Cochrane steam stack and cut-out valve heater and receiver, Cochrane steam and oil separators. Represented by H. E. Libson, J. Russell Hibbs,

Hauck Manufacturing Company, Brooklyn, N. Y., space 200, Aquarium Court. Demonstrating portable oil burners for steel car repairs, kerosene blow torches, lead, babbitt and zinc melting furnaces, oil rivet forges, kerosene bonding torches, furnace burners, tire heaters, brazing outfits, kerosene burners for taking up center plates, portable heaters for straightening and bending rails, preheating torches for use with oxy-acetylene and electric welding machines, paint burners and linemen's torches. Represented by George P. Kittel, A. Busch Hauck.

Heywood Brothers & Wakefield Company, Wakefield, Mass., space 566, Annex. Railway car seats with pressed steel features; reed parlor-car chairs, canvas-lined rattan car seat webbing. Represented by Bertram Berry, Scot Wade, E. C. Lang.

Hubbard & Company, Pittsburgh, Pa., space 618, Hotel Men's Annex. Pole line hardware, Peirce brackets, Bo-Arrow arms, channel-iron arms, angle-iron arms, forged steel high-tension insulator pins, steel poles, anchor braces, drop forgings, construction tools and shovels, Hunt nut locks. Represented by C. L. Peirce, Jr., J. A. McLaughlin, Jr., Richard M. Kerschner.

Hunter Illuminated Car Sign Company, Flushing, N. Y., spaces 36, 38. Destination car signs. Represented by Lytle J. Hunter, Fenley Hunter, Gale Hunter, Harry Reisiger.

Independent Lamp & Wire Company, Inc., New York, N. Y., space 527, Annex. Salamander Asbestos insulated magnet wire, fireproof armature and field coils, asbestos tape. Represented by R. Bingham Dana, secretary, Frank A. Duff, superintendent coil department.

Index Visible, Inc., New York, N. Y., space 523, Annex. Visible card index files and systems. Represented by LeRoy M. Wightman.

Indianapolis Switch & Frog Company, Springfield, Ohio, space 173. Manganese frogs and track work; continuous railway crossings; Indianapolis portable electric track welder, Indianapolis portable electric track grinder, track drills, electric welded joints, electric welded steel tie construction. Represented by E. C. Price, W. H. Thomas, H. H. Murray, J. A. Feulks.

International Register Company, Chicago, Ill., spaces 300, 302, 304. Electrically-operated station coin register, standard coin register and fare box, standard International single and double registers, car fittings, Heeren enamel badges, International conductors' punches. Represented by A. H. Woodward, president; John Benham, vice-president.

International Steel Tie Company, Cleveland, Ohio, space 148, Machinery Hall. Steel crossing substructure with crossing section fastened in place, insulated steel tie for open track with rail fastened in place, steel plate tie with rail fastened in place. Represented by William P. Day, J. J. O'Donnell, L. C. Shank.

Jennison-Wright Company, Toledo, Ohio, space 110, Machinery Hall. Kreolite lug wood block track paving, Kreolite Hex-wood block factory shop floors, creosoted ties, cross arms, cross-arm pins, creosoted structural timbers. Represented by H. G. Jennison, F. W. Cherrington, L. P. Drinker.

J. N. Johns Manufacturing Company, New York, N. Y., space 371, Exhibition Hall. Pivot journal bearings and wedges, standard journal bearings and wedges, check plates guaranteed type, Flower brush holders, air brakes and controller handles with steel tube bushings, steel tube bushings for air brake and controller handles and stems, replaceable center trolley wheels, general line of castings brass, bronze and malleable, babbitt metal three grades, Col-R-01 car curtain and hand strap renewer, rub-on varnish cane seat preserver. Represented by F. W. Roth, D. B. Flower.

H. W. Johns-Manville Company, New York, N. Y., space 336. Overhead line material, molded insulation, ebony asbestos wood for switchboards, fiber conduit, Noark protective devices, including boxes, fuses, cut-outs and accessories, hard fiber tubing and sheets, expander rings, Niagrite cable wrapping, friction tape and splicing compound, "J-M" sand hose, electric car heaters, rail bonds, asbestos roofing, pipe covering and packing. Represented by J. W. Perry, general manager electric department; S. G. Meek, assistant manager electric department; J. H. McManus, New York, N. Y.; H. M. Voorhis, Philadelphia, Pa.; E. B. Hatch, president The Johns-Pratt Company, Hartford, Conn.; R. C. Buell, secretary The Johns-Pratt Company, Hartford, Conn.; George Christensen, New York, N. Y.

Johnson Fare Box Company, Chicago, Ill., spaces 320, 322, 324, Exhibition Hall. Johnson standard fare box, Johnson registering fare box with penny lock-up. Johnson registering fare box with penny lock-up and trip cyclometer, Johnson registering fare box with automatic ticket cancelling and counting device, Johnson automatically operated examination top and registering fare box designed for elevated and subway stations. Represented by C. H. Birdsall, W. P. Butler, J. M. Johnson, H. J. Baur.

Kerite Insulated Wire & Cable Company, New York, N. Y., spaces 130, 132, Machinery Hall. Kerite insulated wires and cables and insulating tape. Represented by Major A. Ames, P. W. Miller, J. Warren Young.

Laconia Car Company, Boston, Mass., space opposite entrance to Pier. Center-entrance car, length 23 ft. over buffers, seats forty-four passengers, weight completely equipped but 500 lb. per seated passenger, being lightest motor car yet shown. Model shown inside the car to illustrate the non-oscillating features. Represented by Cernell S. Hawley, J. E. Johnson, Peter M. Kling, E. J. Fitzgerald.

Lorain Steel Company, Johnstown, Pa., space 418. Track special work, samples of girder, guard and high T-rails including the new standard A. E. R. A. sections, electrically welded joints. Represented by H. C. Evans, New York, N. Y.; John A. Stacey, New York, N. Y.; E. M. Noonan, New York, N. Y.; A. S. Littlefield, Chicago, Ill.; S. P. McGough, Chicago, Ill.; A. L. Verner, Cleveland, Ohio; W. W. Kingston, Atlanta, Ga.; J. Thomas Moore, Atlanta, Ga.; Staats J. Cotsworth, Philadelphia, Pa.; Joseph MacCarroll, Jr., Philadelphia, Pa.; H. L. Gleeson, Pittsburgh, Pa.; and H. C. Stiff, George W. Reese, Edward Ott, James E. Decker, William Lynam, S. C. Weeks, W. Milt Brown, Carroll Burton, E. B. Entwisle, H. F. A. Kleinschmidt, P. M. Boyd, Johnstown, Pa.

Lord Manufacturing Company, Brooklyn, N. Y., space 577. Lord differential staffless brake, Giant perfected brake, Earll retriever, Earll catcher, Sterling trolley base, Sterling sander, Lord screenless air cleaner, Abacot static discharger, Hydroground, Sterling Fender, Sterling and Rhode Island wheelguards, Sterling ticket punches. Represented by E. A. Lightner, secretary and sales manager; L. W. Horne, chief engineer.

Lutz-Webster Engineering Company, Inc., Philadelphia, Pa., space 509. Lutz compression tools, consisting of compression wrench, compression ratchet, one-piece Ratchet, self-feed "Old Man" or drilling post with solid or full swivel arms, nut and bolt sockets and extension sockets, Lutz adjustable watertight floor box. Represented by W. H. Lutz, Sam Mason.

McGraw Publishing Company, Inc., New York, N. Y. (See ELECTRIC RAILWAY JOURNAL.)

McQuay-Norris Manufacturing Company, St. Louis, Mo., space 319, Exhibition Hall. "Leak-Proof" piston head packing rings. Represented by W. K. Norris, E. H. Hill, H. P. Marsh.

McRae's Blue Book Company, Chicago, Ill., space 10 B, Main building. *McRae's Blue Book*, with which is consolidated *The Railway Supply Index*. Represented by A. Smith, New York.

Mark Manufacturing Company, Chicago, Ill., space 617, Annex. Mark cold-drawn steel union. Represented by B. G. Calloway, J. K. Saville.

Maryland Steel Company, Philadelphia, Pa., space 23. See notice under the Pennsylvania Steel Company. Represented by Messrs. Jay, Tackaberry, Clark, Belknap, Gillispie, Davis, Balsich, Vickery, Henderson, Alden.

Midvale Steel Company, Nicetown, Philadelphia, Pa., space 640, Hotel Men's Building. Rolled-steel wheels, steel-tired wheels, axles. Represented by H. M. Deemer, D. V. Foster, W. S. Edger, A. E. Goodhue, T. W. Illingworth, Thomas Price, E. F. Berger.

Morgan Crucible Company, Ltd., New York, N. Y., spaces 104, 106, Machinery Hall. Morganite and Battersea carbon brushes. Represented by H. W. Knott, E. F. Dickieson, Jr., T. U. Franklin, H. W. Gudmens.

Nachod Signal Company, Inc., New York, N. Y., space 124, Machinery Hall. Track model of single track disk signals, single track light signal, highway crossing bell with flashing lights, high-voltage relays, high-speed trolley contactors, automatic headway recorders. Represented by Messrs. Nachod, Stone, Knerr, Guthorn.

National Brake Company, Buffalo, N. Y., spaces 368, 369, Exhibition Hall. Peacock improved brakes, Peacock brakes, Ackley adjustable brakes, Tiger brakes, accessories. Represented by Frank D. Miller, W. D. Brewster.

National Brake & Electric Company, Milwaukee, Wis., space 15, Main Building. National air brake compressors of the direct suspended type, new National low-type air brake compressor and a complete line of automatic governors and motorman's valves, "3VS" motor-driven compressor for industrial and shop service, together with other types of both stationary and portable compressors with special automatic controlling system for alternating current. Various types of belt-driven compressors.

National Car Wheel Company, Pittsburgh, Pa., spaces 578, 579, Annex. Cast-iron wheels of Star special quality and special design for electric railway service. Represented by John Howard Yardley, vice-president; E. H. Chapin, J. F. Weisbrod, H. E. McClumpha, J. D. Cunningham.

National Lock Washer Company, The, Newark, N. J., space 539, Annex. Models of car curtains, curtain fixtures, window fixtures, National lock washers, Hipower nut locks. Represented by F. B. Archibald, R. F. Horsey, J. H. Horn.

National Tube Company, Pittsburgh, Pa., spaces 554, 555, 556, 557. "National" tubular street poles; short sections of "National" tubular street poles with windows, curtained to show construction of joints; Shelby seamless trolley poles machined to show construction; trolley pole testing machine; one 17-ft. length of National casing, telescoped into three thicknesses, also a 2-ft. length machined to show telescoping; Shelby table top made from hundreds of pieces of Shelby tubing; pair of andirons showing in actual material and line of process of the making of Shelby seamless tubing from billet to finished tube; Kewanee unions, N. T. C. regrinding valves and Kewanee specialties. Represented by L. F. Hamilton, W. S. Bitting, W. A. Phillis and others.

Naugle Pole & Tie Company, Chicago, Ill., spaces 332-334, Exhibition Hall. Cedar ties in actual service from ten to twenty-nine years; sections of poles in service for twenty years; sections of poles treated with a hot preservative by Naugle open tank method; sections of new cedar ties and poles. Represented by L. E. Morier, A. T. Naugle.

Nelson Valve Company, Chestnut Hill, Philadelphia, Pa., space 126, Machinery Hall. An 18-in. steel gate valve for superheated steam; steel throttle valves for superheated steam; bronze gate, globe, angle and check valves; iron body gate, globe, angle and check valves; automatic non-return stop check valves; balanced control valves; Nelson-Erwood swing gate valve. Represented by H. C. Baynard.

New York Switch & Crossing Company, Hoboken, N. J., spaces 562, 563, Annex. Improved type pinless, big heel tongue switch with manganese bed and tongue and universal spring attachment, reinforced switch tongue, solid manganese tongue switch with anti-straddle attachment, girder rail mate with manganese insert, hard center girder rail frog. Represented by H. R. Sherman, C. L. Wood, E. S. Fassett, D. R. Payne.

Nungesser Carbon & Battery Company, The, Cleveland, Ohio, space 513, Annex. Carbon, graphite and metal brushes. Represented by Hibbard S. Greene, Warner Jones, E. C. Hastings.

Nuttall Company, The R. D., Pittsburgh, Pa., spaces 140, 142, 144, Building No. 1. Complete line of motor gears and pinions, and current collecting devices, including pantographs, for street railway, interurban and trunk line multiple unit cars and electric locomotives; electric furnace with quenching baths in which steel will be treated and a thorough demonstration given of the methods of manufacturing gears and pinions; machine for breaking and testing pieces; new abrasive testing machine for demonstrating the resistance to wear of the different types of gears; 24-in. tooth carbonized and etched to show relation between the depth of the case and core of a case-hardened gear; Metcalfe test showing evolution in production of case-hardened gears; also a trolley in which the spring leverage is balanced to give minimum wire pressure when the pole is in horizontal position while the maximum wire pressure occurs at about 60 deg. angle from the horizontal. Represented by F. A. Estep, president; W. L. Allen, commercial manager; L. H. Keim, mechanical engineer.

Ohio Brass Company, Mansfield, Ohio, spaces 358 to 365 inclusive. In operation: Tomlinson couplers, O-B air sander system, O-B car lighting regulator, O-B trolley bases, retrievers and catchers, O-B electric car signal system, Melobeam headlights, rail bond apparatus and test of insulation. On display: O-B trolley guard, O-B catenary material, O-B porcelain insulators, O-B overhead trolley fixtures, O-B third-rail insulators, etc. Represented by C. K. King, A. L. Wilkinson, E. F. Wickwire, C. C. Beck, J. R. Brown, A. L. Price, G. H. Bolus, W. C. Starkey, J. E. Slimp, N. M. Garland, G. W. Cooper, G. A. Kroener, Nathan Shute, P. A. Hinds, W. H. Bloss, G. E. Willis, F. A. Strail, C. H. Tomlinson.

Ohmer Fare Register Company, Dayton, Ohio, spaces 301, 303, 305. Indicating recording and printing fare registers for registering from one up to sixty classifications; two types of cash totalizing registers for city service; new Universal register for interurban service, covering from 1 cent in multiples of cents to $10; new Safe Deposit fare box; model registering gate. Represented by John F. Ohmer, Grank G. Colby, J. H. Stedman, C. W. Ketteman, John F. Ohmer, Jr., C. V. Funk, E. H. Chapin, E. R. Diehl.

Okonite Company, The, New York, N. Y., space 168. Okonite insulated wires and cables (including steel taped and steel braided) for all conditions of service, Okonite insulating tape, Manson tape, Candee potheads, etc. Represented by W. L. Candee, F. J. White, W. M. Candee, L. G. Martin, W. T. Kyle, R. Mace.

Pantasote Company, The, New York, N. Y., space 400. Agasote headlining, wainscoting, exterior and interior trim, flooring, Pantasote upholstery material, Pantasote car curtain material. Represented by John M. High, William A. Lake, William Anderson.

Penn Metal Company, Boston, Mass., space 108. "Penco" improved smooth bottom culvert, "Penco" "Nestite" wire-bound culvert, "Penco" "Nobolt" flat bottom culvert or railway drain, "Colonial" all-round corrugated culvert, "Penco" metal shingles, "Penco" "Lox-on" tile. Represented by L. J. Rouleau.

Pennsylvania Steel Company, The, Philadelphia, Pa., space 23. Street railway special work, Hook heel tongue switches, double connected tongue switches for MCB wheels, rapid renewable hard center frog, New Century switch stands, main line switch stands, tensile tests Mayari bolts, vibratory tests Mayari bolt steel, solid manard crossing interior joint, Mayari shovels. Represented by Messrs. Jay, Tackaberry, Clark, Belknap, Gillispie, Davis, Salsich, Vickery, Henderson, Alden.

Pittsburgh Steel Company, Pittsburgh, Pa., spaces 162, 164. Railroad fencing, galvanized barb wire, wire nails, plain galvanized wire, etc. Represented by M. E. Johnson, assistant general manager of sales; George W. Jones, assistant manager New York office; E. Sidney Lewis, special sales agent.

Prepayment Car Sales Company, New York, N. Y., space 114. Pneumatically and electrically-operated door mechanism, coasting relays, signal and safety devices, manually-operated door and step mechanism, line switch circuit-breakers and contactors for safety devices, etc. Represented by Duncan McDonald, chairman board of directors; Thomas W. Casey, president; A. H. Englund, vice-president; Harold Rowntree, treasurer; P. R. Forman, chief engineer, and Willard A. Cockley, Thomas H. Henkle, Nelson P. Hall, J. W. Porter, M. A. Berg, special representatives.

Prest-O-Lite Company, Inc., Indianapolis, Ind., space 543, Annex. Prest-O-Oxy-acetylene welding and cutting equipment and all accessories; specimens of actual welding as applied to electric railway repair shop practice; specimens of bonded rails made by process; flare lamps; demonstrations of welding and cutting. Represented by H. Sidney Smith, Stanley D. Winger, C. R. Sutton.

Prince-Groff Company, New York, N. Y., spaces 384-385, Exhibition Hall. "Wedglok" track drilling systems, "Pressurlokd" water gage systems, "Kwikgrip" pipe wrenches. Represented by Sherman W. Prince, Clarence B. Groff, Harold Prince, Dwight Prince.

Pyrene Manufacturing Company, New York, N. Y., space 215, opposite aquarium. Approved Pyrene fire extinguishers, bracket for attaching to cars, tamper proof boxes for holding extinguisher, demonstrations on electric arcs daily and various other demonstrations of the non-conductivity of Pyrene liquid. Represented by E. L. Krut, J. P. Maloney, O. E. Meske.

Rail Joint Company, The, New York, N. Y., spaces 350 to 357 inclusive, Exhibition Hall. Types of T, high T, girder and compromise joints manufactured for practically every section of rail rolled. Represented by L. F. Braine, V. C. Armstrong, J. A. Greer, E. A. Condit, Jr., R. R. Seward, McLeod Thomson, Alexander Chapman, W. A. Chapman, J. C. Barr.

Railway Improvement Company, New York, N. Y., spaces 584, 506, Annex. Coasting recorders, terminal clocks, current clocks, meters, sanitary strap covers, anti-climbers. Represented by Andrew J. Pizzini, W. O. Wade, E. B. McKinney, C. W. Hall, S. Clark Morrell.

Railway & Industrial Engineering Company, Greensburg, Pa., space 609, Annex. Burke horn gap switches, lightning arresters, choke coils, and fuses for all voltages from 11,000 to 66,000; suspension type 6600-volt lightning arresters; T. E. line clips; commutator slotting tools; photographs and drawings showing installations and applications of Burke equipment; in space outside the Annex near the engineering meeting room outdoor transformer substation and T. E. lattice steel pole. Represented by L. C. Hart, G. N. Lemmon, W. Barnes, Jr.

Railway Materials Company, Chicago, Ill., space 534. Samples of brakeshoes and overhead trolley switch.

Railway Roller Bearing Company, Syracuse, N. Y., space 134, Machinery Hall. Rollway journal boxes, motor bearings, car wheels. Represented by Raymond H. Carhart, John W. Hulburt.

Railway Track-work Company, Philadelphia, Pa., spaces 161, 163, Machinery Hall. Track grinding machinery, reciprocating track grinder, unit design flexible shafting. Represented by William D. Gherky, William B. Goodall, Anthony M. Nardini.

Railway Utility Company, Chicago, Ill., spaces 372, 373. Ventilators and ventilating systems, thermostats. Represented by William J. Pine, Lee P. Haynes, James H. Denton, Frank O. Grayson, George E. Pratt.

Roebling's Sons Company, John A., Trenton, N. J., spaces 17, 19, Main Building. Samples of Roebling wire products including bare wire, iron, steel and copper wire, wire rope and fittings, Alligator wrenches, wire cloth and netting, factory-made car cables and insulated wire and cables for every purpose. Represented by F. J. Newbury, G. W. Swan, D. Foster Ivens, F. J. Whelan, W. L. Doyle, George I. Gheen, G. F. Atlee, J. E. Nolan, A. B. Conover, T. N. Hall, J. W. Whelan, A. V. Errickson.

Rooke Automatic Register Company, Providence, R. I., space 321, Machinery Hall. Rooke automatic fare collector (hand-held type) in capacities to receive and register coins of various denominations and tickets. Represented by George F. Rooke, Jilson J. Coleman, R. S. Rooke.

SKF Ball Bearing Company, New York, N. Y., space 532. Railway axle on wheels with ball bearing journal boxes in operation, assortment of bearings. Represented by H. E. Walker, H. H. Gildner, F. H. Poor.

St. Louis Car Company, St. Louis, Mo., space 588. Seats, rattan for car seating, vertical wheel brakes, illustrations and models of latest steel and semi-steel car designs. Represented by Edwin B. Meissner, Nic Le Grand, George L. Kippenberger, W. L. Alt.

St. Louis Steel Foundry Company, St. Louis, Mo., space 14, Main Building. Manganese steel tadpole switches and parts, manganese steel special U-section crossings. Represented by J. H. Steedman, vice-president; E. S. Harrison, sales engineer.

Sattley Manufacturing Company, Detroit, Mich, spaces 378, 379. One Type B coin-sorting, counting and packaging machine, one Type E coin-counting and packaging machine, one Type F coin-counting and packaging machine, two "Coinometers." Represented by F. L. Sattley, F. S. Strattan, E. C. Malo, M. W. Van Husan.

Sauvage-Ward Brake Company, Inc., New York, N. Y., space 501, Annex. Two types of brake automatic slack adjusters; special brake adjusting bar; also demonstration of adjusters in service on Atlantic City & Shore Railway, as at South Carolina Avenue and Boardwalk a car will be jacked up with truck pulled out to permit ready inspection. Represented by Frank D. Ward, M. E., vice-president; George P. Smith, secretary; H. M. Weaver, Eastern traveling rep.; B. B. Ringo, traveling engineer.

Schutte & Koerting Company, Philadelphia, Pa., spaces 154, 156, Machinery Hall. Valves, jets and special apparatus such as engine stops, trip throttle valves in operation; and boiler non-return valves, and reducing valves; steam jet syphon, injectors, blowers and exhausters, multi-jet condenser and air washer (for generator sets) in operation; spray cooling nozzles and oil separator, etc. Represented by J. J. Gessleman, in charge; G. Heinemann, P. W. Knauf, T. H. Johnson.

Seymour Portable Rail Grinder, Lowell, Mass., space 138, Machinery Hall. Seymour portable rail grinder. Represented by E. P. Seymour.

Simmen Automatic Railway Signal Company, Buffalo, N. Y., spaces 153, 155, Machinery Hall. Speed control apparatus for automatically controlling the speed of trains: dispatcher's table for controlling signals in cabs of moving trains and for making automatic record of the movement of all trains on the division equipped; movable car showing operation of cab signal and signal shoe on third-rail. Represented by P. J. Simmen, L. Ringer, E. Moore, C. E. Chatfield.

Simmons-Boardman Publishing Company, New York, N. Y., space 10-A, Main Building. *Railway Age Gazette, Railway Age Gazette*, mechanical edition, *The Signal Engineer*. Represented by Henry Lee, C. R. Mills, George L. Fowler.

Smith Heater Company, The, Peter, Detroit, Mich., spaces 376, 377, Exhibition Hall. No. 1-S Peter Smith forced ventilation magazine hot air heater, No. 2-P Peter Smith forced ventilation hot air heater, No. 3-P Peter Smith forced ventilation hot air heater. Represented by Daniel W. Smith, president; Elmer J. Smith, vice-president and general manager; M. J. Phelan, secretary; W. E. Hinmon, Western sales manager; W. M. McKee, Eastern sales manager.

Speer Carbon Company, St. Marys, Pa., space 8-A, Main building. Carbon and metal brushes for railway motors and generators. Represented by John S. Speer, Charles Lyon.

Standard Corporation, Philadelphia, Pa., space 10-C, Main building. Lefax engineers' loose-leaf pocket book, self-indexing reference library, condensed catalog file, Lefax filing boxes, blank sheets, traveling case, etc. Represented by J. C. Parker, William C. Wells, Jr.

Standard Paint Company, New York, N. Y., space 507, Annex. P & B insulating varnishes and compounds, "Imp" cement floor finishes, preservative paints, "Amiwud" wall board, prepared roofings and waterproofing compounds. Represented by C. E. Smith, J. H. Thomas, W. S. Noble.

Standard Underground Cable Company, Pittsburgh, Pa., space 388, Exposition Hall. Bare and insulated electric wires and cables of all kinds, cable terminals for indoor and outdoor service, cable junction boxes, joints and joining material and other cable accessories. Represented by C. J. Marsh, F. O. Hoyt, R. S. Hopkins, New York; Edward Kerschner, R. M. Hirst, Philadelphia; J. H. Lytle, J. C. Bowman, Pittsburgh.

Star Brass Works, Kalamazoo, Mich., space 506, Annex. Kalamazoo trolley wheels and harps. Represented by O. P. Johnson.

Sterling Fare Register Company, New Haven, Conn., space 328, Exhibition Hall. Fare registers, register fittings, fare boxes, trolley retrievers, trolley catchers, trolley wheels, conductors' punches. Represented by Frank B. Kennedy, Charles E. Gierding.

Sterling Varnish Company, Pittsburgh, Pa., space 567, Annex. Insulating varnishes and impregnating compounds, structural steel paints. Represented by J. H. Shugg, W. V. Whitfield, Alvin S. King.

Street Railway Signal Company, Inc., Philadelphia, Pa., spaces 117, 119. Automatic signals for single-track facing protection, and allowing following movements; automatic signals for rear and double-track protection. Represented by F. W. Kulicke, H. R. Stadelman, W. V. Moon.

Taylor Electric Truck Company, Troy, N. Y., spaces 109, 111, 113, 115, Machinery Hall. New Taylor maximum traction single motor truck for city and suburban service; Taylor M.C.B. triple spring truck for high-speed interurban service; Taylor L.B. double truck with inside-hung brakes for city and interurban service; Taylor extra heavy non-teetering single truck 8 ft. wheelbase for heavy long single truck vestibule car bodies; also a full line of elliptic and coil springs for any type and make of truck and T. M. C. steel-tired wheels. Represented by John Taylor, president; G. A. Tupper, superintendent; Walter E. Taylor, assistant superintendent.

Templeton, Kenly & Co., Ltd., Chicago, Ill., space 636. Simplex emergency jacks, Simplex pole pulling jacks, Simplex car jacks, Simplex track jacks. Represented by A. E. Barron, C. A. Crane, Jr., H. M. Hood, W. B. Templeton.

Thayer & Company, Inc., New York, N. Y., space 510. Chillingworth seamless drawn-steel gear case. Represented by G. K. Wannemacher.

Thew Automatic Shovel Company, Lorain, Ohio, space 309, Exhibition Hall. Catalogs, blueprints, circulars, photographs, etc., of the Thew electric shovel especially designed for electric railways. Represented by C. B. Smythe, G. T. Glover.

Thompson, Ernest H., Waverly, Mass., space 314, Exhibition Hall. Combination fare box and automatic coin changer, operated electrically by means of solenoids. Represented by E. H. Thompson.

Tool Steel Gear & Pinion Company, Cincinnati, Ohio, space 624. "Tool Steel" split, solid and forged gears, and "Tool Steel" pinions; also samples to illustrate the hardening and toughening process responsible for their long life and strength; in addition a large collection of "Tool Steel" gears and pinions, that have been in service for a number of years and made interesting mileage records as compared with other grades. Represented by C. E. Sawtelle, E. S. Sawtelle, Leroy Brooks, Jr.

Transportation Utilities Company, New York, N. Y., spaces 582, 583. Treated duck roofing, composition flooring, Chanarch metal flooring, curtain fixtures, brass sash, trap doors for interurban service, metallic steel sheathing, safety step and treads, insulation against heat and cold, sash locks, weatherstripping, steel doors and revolving curtain roller box, Eclipse deck sash ratches. Represented by W. L. Conwell, H. B. Chamberlain, F. N. Grigg, W. S. Midgley, R. C. Monroe.

Trigger-Lock Reversible Controller Finger, Niagara Falls, N. Y., and Toronto, Ont., space 151, Machinery Building. Trigger-Lock reversible controller fingers. Represented by Richard Russell, E. W. Bennett, R. V. Russell.

Trolley Supply Company, The, Canton, Ohio, spaces 366, 367. Peerless No. 10 trolley base, Simplex trolley base; No. 5 and No. 2 Knutsen retrievers, Ideal trolley catcher, detachable fender, pressed-steel headlights, Peerless check valve. J. E. McLain, president; Jos. Hollis, supt.

Union Switch & Signal Company, The, Swissvale, Pa., spaces 133, 135, 137, 139. Track model of block signaling, track transformer, vane type relay, galvanometer type relay, Model 12 polyphase relay. Photographs of installations. Represented by H. W. Griffin, J. W. White, W. W. Talbert, S. E. Gillespie, J. P. Coleman, L. F. Howard, C. E. Denney, J. E. Saunders, H. A. Hamilton, T. W. Siemon, J. S. Hobson, H. McCready.

United States Electric Signal Company, West Newton, Mass., space 401, Annex. Automatic block signals, automatic car counting signals, automatic block light signals, automatic crossing signals, electric track switches, automatic current regulator, trolley contactors. Represented by Roland F. Gammons, second, Roy V. Collins, R. S. Bowen.

U. S. Metal & Manufacturing Company, New York, N. Y., spaces 622, 624, Hotel Men's Annex. Ball-bearing journal jacks, Texoderm seat upholstering, Columbia lock nuts, Anglo-American varnishes, tool steel gears and pinions, multiple unit puttyless skylight. Represented by B. A. Hegeman, Jr., Charles C. Castle, H. A. Hegeman, H. A. Stone, H. S. Norris, H. K. Porter.

United States Wood Preserving Company, New York, N. Y., space 107, Machinery Building. Treated and untreated wood paving blocks. Represented by G. O. Strother.

Universal Lubricating Company, Cleveland, Ohio, space 370, Exhibition Hall. Reception room. Represented by C. B. Arthur, J. C. Daigen, H. T. Curtis.

Universal Safety Tread Company, Waltham, Mass., space 568, Annex. Safety car step treads for car steps, stations, platforms, etc. F. W. Langford, H. Dougherty.

Valentine & Company, New York, N. Y., spaces 582, 583, Annex. Valspar ("The varnish that won't turn white"). Systems of painting railway equipment. Represented by L. B. Valentine, I. H. Munford, Capt. C. Van de Watering.

Van Dorn Coupler Company, Chicago, Ill, spaces 531, 533. Van Dorn makes of standard couplers. Represented by W. T. Van Dorn, H. E. Van Dorn, W. E. Van Dorn.

Waclark Wire Company, New York, N. Y., spaces 381, 383, Exhibition Hall. A "whip" of wire drawn in one piece from a ⅜-in. rod to 0.001-in.; weatherproof cable, bare cable and American standard grooved trolley wire; also a sample board. E. L. Goldschmidt, C. P. Lyman.

Walpole Tire & Rubber Company, Walpole, Mass., space 333. Insulating tapes, insulating varnishes. Represented by F. Y. Stewart, general sales manager; I. W. Penniman, Western sales manager; R. F. Norvell, C. O. Anthony, E. C. Green, general purchasing agent.

Wasson Engineering & Supply Company, Santa Rosa, Cal., distributing point, Milwaukee, Wis., space 613, Annex. Air retrieving trolley base. F. A. Wasson, C. Pfeiffer.

Watson Stillman Company, Aldene, N. J., space 611. Telescopic motor lift jack; 20-ton wrecking jack, 20-ton claw 18 in.; 5-ton special street car jack, No. 4 mounted girder rail bender. Represented by Edwin A. Stillman, A. F. Stillman, Francis T. West, Sterling G. Turner, P. R. Ketzer, Carl Wigtel, R. R. Harrison.

Western Electric Company, New York, N. Y., space 337. Telephone apparatus consisting of telephones for car operation including portable and siding telephones and standard exchange equipment of both wall and desk types, telephone selective apparatus for car dispatching service, telephone switchboards; electric railway material, high-tension insulators, Pyrene fire extinguishers, Western Electric insulating tapes and compounds, trolley wheels and harps, rail bonds and miscellaneous trolley line construction material, car buzzers and signal bells, Shelby trolley poles, arc and incandescent headlights, out-door electric light fixtures; vacuum cleaners for cars. Represented by M. A. Oberlander, P. L. Thomson, F. D. Killion, O. E. Stevens, E. V. Adams, A. G. Kingman, J. C. Enders, J. C. Maxon, New York, N. Y.; J. D. Kennedy, A. L. Hallstrom, S. Greenfield, L. C. Coller, F. C. Jaeger, J. R. Stuard, G. F. Livezey, J. W. Alexander, Philadelphia, Pa.

Westinghouse Electric & Manufacturing Company, East Pittsburgh, Pa., space 21. New types PK and HL control systems in actual operation, line switches, relays, commutating pole motors of the split and box frame types for various capacities and voltages from 600 to 1500, motor parts, pressed steel gear case, commutators, armature and field coils, resistors, circuit breakers, lightning arresters, fuse boxes, line and insulating material, model of a portable rotary converter substation. Represented by L. A. Osborne, S. L. Nicholson, C. S. Cook, M. B. Lambert, B. W. Stemmerich, G. B. Griffin, J. G. Miles, H. L. Garbutt, T. A. McDowell, J. C. McQuiston, H. W. Beaumont, A. B. Cole, East Pittsburgh; C. C. Ewing and L. P. Morris, Boston; O. T. Smith, H. N. Ransom, New York; Thomas Cooper, Philadelphia; T. R. Langan, Baltimore; E. A. Thornwell, Atlanta; J. A. Brett, Cincinnati; D. E. Parsons, Pittsburgh; G. S. Vail, Cleveland; P. H. Smith, Buffalo; A. W. Lomis, St. Louis; W. G. Brooks, Chicago; F. F. Rossman, Kansas City; S. J. Keese, Los Angeles.

Westinghouse Lamp Company, space 21. Mazda lamps illustrating the latest developments in the lamp field; concentrated filament headlight lamps for trolley car service; standard Mazda lamps for electric railway service, and also for ordinary uses. T. G. Whaling, C. A. Dostal, A. Larney, W. H. Rolinson, A. A. Ross.

Westinghouse Machine Company, space 21. Turbo-exciter of 50 kw capacity. Represented by E. H. Sniffen, vice-president, in charge of sales; L. L. Brinsmade, Eastern sales manager; H. P. Childs, special representative; M. C. McNeil, commercial engineer.

Westinghouse Traction Brake Company, space 21. Exhibits of various forms of air brake devices and appliances, comprising motor-driven air compressors; motorman's brake valves; electric compressor governors; air compressor synchronizing system; electro-pneumatic train signal system; complete car equipments with electro-pneumatic brakes of most improved construction; slack adjuster; air strainers; extra quality pipe fittings; case hardened bushings, etc. Represented by A. L. Humphrey, Pittsburgh; Walter V. Turner, Pittsburgh; C. J. Olmstead, Chicago; C. C. Farmer, Chicago; H. S. Clark, San Francisco; J. S. Siegrist, Portland; J. R. Ellicott, New York; C. R. Ellicott, New York; W. G. Kaylor, New York; C. P. Cass St. Louis; C. H. Beck, St. Louis; E. A. Craig, Pittsburgh; C. P. Billings, Pittsburgh; S. D. Hutchins, Columbus, Ohio; R. W. Williams, Atlanta, Ga.

Wharton, Jr., & Company, Inc., Wm., Philadelphia, Pa., spaces 621, 623, Annex. Several styles of girder rail work, including a switch of the Wharton new solid manganese steel H.C.B. type, switch pieces of a new heavy construction for portable crossovers and turnouts, miscellaneous manganese steel castings for cars, a new switch rod for split switches, switch locks, models, pictures of complicated layouts, etc. Represented by V. Angerer, vice-president; W. L. Wright, vice-president; R. C. McCloy, general sales agent; and the following district sales managers: R. D. Chapman, San Francisco; R. C. Hoffman, Baltimore; J. T. Hill, Baltimore; G. R. Lyman, Chicago; H. F. McDermott, Atlanta; J. S. Morrison, Pittsburgh; J. C. Robinson, Boston; C. N. Shaffner, Philadelphia; William C. Wilson, New York.

Wheel Truing Brake Shoe Company, Detroit, Mich., space 505, Annex. Abrasive brakeshoes for operating upon different conditions of wheel wear, including double flanges, flat spots, uneven diameters, long flanges, tread wear, etc. Represented by J. M. Griffin, F. F. Griffin.

Whitmore Manufacturing Company, Cleveland, Ohio, spaces 121, 123, 125. Gears and pinions lubricated with Whitmore's gear protective composition. William Beaser, Jr., Henry Stuckenholt, W. M. Lawyer, S. W. Whitmore.

Whittier Mills Company, Chattanooga, Ga., space 313. Waterproof trolley cord, bell cord. Represented by G. H. Thomas.

Wilson Remover Company and Imperial Car Cleaner Company, Newark, N. J., space 213, Aquarium Court. Wilson paint and varnish removers, Imperial cane cushion cleaning machine and process. Represented by J. Whitney Wilson, J. MacNaull Wilson.

Wood Company, Charles N., Boston, Mass., space 129, Machinery Hall. Chapman automatic signals. Represented by Charles N. Wood, W. M. Chapman, O. E. Chapman.

Woods & Company, Edwin S., Chicago, Ill., space 537, Annex. Roller side bearings and center plates for interurban car equipment. C. D. Jenks, H. M. Perry, A. A. Weigel.

Wyoming Shovel Works, Wyoming, Pa., space 608. Track, and concrete shovels and scoops. G. E. Geer.

Yarnall-Waring Company, Chestnut Hill, Philadelphia, Pa., space 128. Lea V-Notch recording liquid meter, Simplex seatless blow-off valves; Simplex pipe joint clamps, Richards unloaders for air compressors, Simplex Caskey hydraulic valves. Represented by J. Esherick, E. G. Jay, Jr.

Electric Railway Journal

DAILY EDITION

Published at the Annual Conventions of the American Electric
Railway Association and Its Affiliated Associations

Copyright, 1914, by McGraw Publishing Company, Inc.

Vol. XLIV NEW YORK—WEDNESDAY, OCTOBER 14, 1914—ATLANTIC CITY NO. 15B

PROGRAM FOR TO-DAY

CONVENTION MEETINGS

9:30 a.m.	Meeting of Accountants' Association, Accountants' Hall, Convention Pier.
9:30 a.m.	Meeting of Engineering Association, Engineers' Hall, Convention Pier.
9:30 a.m.	Meeting of Claims Association, Claims Hall, Convention Pier.
9:30 a.m.	Meeting of Transportation & Traffic Association, Greek Temple, Convention Pier.
11:00 a.m.	Joint Session of Accountants' and Claims Associations, Accountants' Hall, Convention Pier.
2:00 p.m.	Meeting of American Association, Greek Temple, Convention Pier.

ENTERTAINMENT

8:00 a.m.	Trapshooting Practice, End of Convention Pier.
10:00 a.m.	Obstacle Golf, Marlborough-Blenheim Lawn.
11:00 a.m.	Morning Concert by Engel's Orchestra, Lobby, Convention Pier.
2:00 p.m.	Trapshooting Tournament, End of Convention Pier.
3:00 p.m.	Afternoon Concert and Thé Dansant, Parisian Garden, Convention Pier.
3:00 p.m.	Finals Auction Bridge Tournament, Reception Room, Convention Pier.
4:00 p.m.	Obstacle Golf, Marlborough-Blenheim Lawn.
9:00 p.m.	Carnival Night, Ball Room, Convention Pier.

The President's Address

President Black's address, delivered yesterday, presents a comprehensive survey of the status of the various activities of the association. He naturally takes up first the work for the year of the committee on public relations but follows this with a short account of what has been done by each of the other committees. In connection with the plans of these committees, but particularly with the work of bureau of fare research, he points out that the proposed increase of dues, if adopted, will provide about $16,000 of additional revenue. After urging the formulation of definite plans for the 1915 convention at San Francisco the address concludes with a discussion of the financial problems before the industry. President Black's address is a thoughful consideration of the problems now confronting the electric railway field and the best means of their solution. These questions are generally understood, but it is of help to have them so clearly stated as in the president's address. Through the plans proposed by the committee on public relations and the work being done by the bureau of fare research, the plan of campaign has been formulated. There remain now only the tasks of mobilization and actual engagement. To be successful, however, the actual fighting should be carried out not only *en masse* but individually, and each company should do its best to prove to the public by precept and example, but especially by the latter, that it is doing its best to provide what the public wants in the way of service.

Standards for Signal Apparatus

That the committee on block signals was able to present yesterday in its report recommendations for two standard designs is a matter whose importance can hardly be exaggerated. Essentially the art of signaling deals with apparatus of considerable complexity. The possible variations in design are innumerable, and these variations, if introduced, add enormously to the cost. This has, unfortunately, been the experience on the steam railroads, where the multiplicity of designs and arrangements fairly baffles description. On the electric railways, however, signaling is in its infancy, and a vast amount of material will be manufactured for their needs during the next decade. The sooner that this can be standardized, the better will it be for all concerned, for cost is the one thing standing between the electric railway industry and complete signal systems. The committee has made an excellent beginning, and it is to be hoped that ensuing committees will continue this phase of the work with as much energy. There is hardly anything they can do that will produce results more directly beneficial to the industry.

Better Air-Brake Hose Wanted

The report of the committee on equipment of the American Electric Railway Engineering Association breaks new ground this year with a first specification for air-brake hose. The full text of this specification will be found elsewhere in this issue. That a specification of this character should have been found necessary at this time is significant of the arduous conditions which are imposed upon air-brake hose by the operation of electric trains over short radius curves, more especially on city and suburban rapid transit lines. The impetus for this specification is to be traced to the experiences of the Brooklyn Rapid Transit System with the regular M.C.B. product. The frequency of hose trouble despite the use of the best products obtainable led, two years ago, to a systematic study of hose defects by W. G. Gove, superintendent of equipment of the Brooklyn company and also vice-chairman of the committee on equipment. One reason for the quick cracking of air-brake hose was found in the large number of sharp curves on the elevated lines. Another existed in the weakening of the hose due to the presence of oil carried over from the compressors. The present specification is planned to correct the first trouble, but the committee recommends that further studies be made before formulating a specification for hose with an oil-resisting tube. The active aid of all train operators should be given to this committee to demonstrate to the manufacturers of air-brake hose that there is a real need and a large market for a grade which will meet the exceptional requirements of electric railway train service.

Step Heights and Loading Time

The youngest of the committees, that on transportation engineering, which has replaced the former committee on two-car train operation, brought out in its report yesterday the fact that a change from the customary step arrangement with three rises to one with four reduced the loading time from three seconds to 1¾ seconds per passenger. In the former arrangement the heights of the steps were 16 in. and 14 in. respectively. While no one of these is excessive, according to street railway standards, any architect with whom the design of stairs is an exact science would be horrified at the mere suggestion to extend the rise of a step beyond 8 in. The use of even a 10-in. rise would, according to architectural ideas, work an extreme hardship upon the user, and yet to our minds—influenced as they are by customs of the railway—a 10-in. step seems extraordinarily moderate. The fact that a four-step combination, having 15-in., 10-in., 10-in. and 10-in. rises, can cut the loading time almost in half, notwithstanding the extra rise that is introduced, will undoubtedly come as a surprise. Nevertheless, the point is an important one, and the new committee is to be congratulated for bringing it out so clearly.

Conventionalities

Mac's lid is alfalfa, also unique.

There are some well-bred axles on exhibit. They have more polish than any other axles we ever met.

Born to blush unseen! MacMurray and Grinnell of the JOURNAL staff in the printing office in Philadelphia.

The official list states that the honor of having Badge No. 1 has fallen to Allen C. Loomis. Who is he, anyway?

The sympathy of the convention goes to George (Doc) Allen, who sprained his knee severely while diving through a big wave.

Charles E. Fritz, engineer of power, Kansas City Railway & Light Company, was routed here over the Chicago special. He is looking 'round.

M. B. Rosevear, superintendent of listribution Public Service Railway, is a proper subject for the "spot light." Less than six years ago he was cadet engineer.

This year our only visitors from foreign shores are W. F. Rainforth, assistant chief engineer of the London General Omnibus Company, and W. G. Gove, of Brooklyn.

C. C. Castle, the cotton broker, has a sign in his booth that says: "This is one bale of cotton. Have you bought yours? Every bale counts." Educated bales, Charley?

In reply to numerous frantic inquiries, Miles Lambert wishes to state that Miss Le Gould, while at Atlantic City, it being chaperoned by Mrs. Mutt, the general manager's wife.

Instead of coming to the convention in comfort Charlie Clark and Terrance Scullin, of Cleveland, drove through from Pittsburgh in Clark's gasoline, sea-going hack. Never again!

In the Detroit United party which came to enjoy the convention are Mr. and Mrs. George Parker and Mr. and Mrs. A. D. B. Van Zandt. Both gentlemen admit that they are in good hands.

An anonymous contributor advises that Bedwell, of the way department of Public Service Railway, say, "If you want your sleepers and track to stay put, bed well." Oof! That's awful!

Don't you feel embarrassed wearing those yellow gloves, storm spectacles, golf skypiece and carrying the big yellow cane? Betcha haven't the nerve to wear them all at once in the home town.

L. F. Howard spent most of yesterday afternoon trying unsuccessfully to get the cars to collide on his own model signal installation. He'd bet S. E. Gillespie a company cigar that it could be done.

Skee-ballers have found the game so fascinating that in order to further studious thought on the subject of the real intricacies of play the skee-ball cocktail has been invented. The line forms on the right.

The Jackson family announces that the Palmer family has nothing in the way of convention honors, on it, Alexander being on the committee on schedules and Walter being on the ELECTRIC RAILWAY JOURNAL.

Great is the man who can make two blades of grass sprout where but one perked up before, but far greater is he who can make one car do the work of two. Take 'em off, Jack Dempsey, take 'em off. We knew you!

Have you seen the exhibits of wooden paving blocks showing that a block in Boston wears ⅛ in. in fourteen years and that one from New York wears twice as much in eleven years? Life in New York must be very wearing, eh?

C. B. Fairchild, Jr., formerly a technical journalist but now a railway operator, is one of the representatives of the Philadelphia Rapid Transit Company at this convention, the nineteenth at which he has been in attendance.

We were glad to see our collaborator and co-editor of last year, Col. Stedman of Rochester, arrive in Atlantic City on Monday. We have not been favored with any contributions for this year's dailies yet, but we have hopes.

Edward H. Chapin lost some of his Rhode Island Reds last week on account of a young flood in his chicken yard. At last reports he was out in the Aquarium bargaining for turtle eggs so that his Reds could hatch out waterproof pullets.

George Smith, of K. C., Missoo, than whom no one is happier, says that the Kansas City Railway & Light Company holds the palm for the biggest delegation west of the Ohio River. There are seven of these representatives of the Road of Franchise Fite.

The Union Traction Company of Indiana is here in full force. Its delegation includes Mr. and Mrs. Arthur W. Brady, H. A. Nicholl, G. H. Kelsay, Walter Shroyer, S. R. Dunbar and Frank Norviel. Frank brought Mrs. Norviel and their son and daughter.

Did you know that the convention is honored by the presence of the Secretary of State? Presumably he is here to negotiate a peace treaty between the Engineering Association and the American Society of ———— (deletion by censor). His badge is 3715.

Prof. Wildman says some men are cut out for accountants and some for motormen, but sometimes the records get mixed and the railway loses an ideal motorman.—Wonder why everybody looked at everybody else when this was sprung in the accountants' meeting yesterday?

H. M. Wheeler, engineer electrical distribution Chicago Surface Lines, and Ralph H. Rice, principal assistant engineer Board of Supervising Engineers, Chicago, Traction, are chumming together this year and make their headquarters at the Dennis. Regulation, where is thy sting!

The entertainment committee has taken a step in advance this year and arranged a large number of fine comfortable opera chairs for the balcony overlooking the main hall of the pier. These seats should be popular with members and guests who don't dance because they know only last year's steps.

The registration office this year is receiving the assistance of two men delegated from the force of the Brooklyn Rapid Transit Company, two men from the Interborough Rapid Transit Company of New York, two men from the Public Service Railway and two men from the American Railways of Philadelphia.

A block-signal enthusiast has sent us a civil war bulletin via Sayville wireless of fifty years ago to-day. Here it is: GENERAL NACHOD directed the FEDERAL army to effect a UNION with the other UNITED STATES forces in a WOOD of perSIMMEN trees to protect the STREET RAILWAY, its sole line of communications from the NORTHEAST. Wow!

The trap shoot opened on Tuesday morning to the whirring of wings, both man-made and natural, as a flock of geese appeared in sight simultaneously with the firing of the first shot by Mr. Castle. A moment later Jaquith, with his hydro-aeroplane, came in sight and made a graceful sweep near the pier. The firing line was kept well filled all morning, the sound of continuous shooting bringing many out to see if the warships could be seen as well as heard.

Several of the delegates took advantage of the trip to Atlantic City to stop over in Philadelphia on Friday and witness the Braves trim the Athletics. One delegate who did not do this was J. H. Wilson, president of the Mobile Light & Railroad Company. He reached Philadelphia with Mrs. Wilson Friday afternoon, but owing to the game he found every hotel crowded with visitors on account of the game, and although he took a taxi and drove to a large number of hotels, could secure no room. Finally he was obliged to go to Wilmington for the night.

The four o'clock train on the Reading Railroad from Philadelphia to Atlantic City is said to be the fastest regular train in the world. It leaves Camden at 4.10 p. m. and reaches the Reading Station at Atlantic City at 5.05 p. m., making the 55½ miles in fifty-five minutes, or at a greater scheduled speed than 60 m.p.h. This means that the train on part of the run has to reach a speed of 80 m.p.h. It may be a surprise to some to learn that anything so fast should be found near Philadelphia. It might be pointed out, however, that this train undoubtedly represents the demand for a fast train to carry people away from that city. Trains going the opposite direction, or to Philadelphia, operate at only moderate speed.

The play-off game between the White Elephants of the Public Service Railway of New Jersey and the Braves of Brooklyn Rapid Transit System was held at Ebbets Field on Saturday, October 10. More than 5,000 people were on hand to root as only deadhead rooters can. Noted in the boxes behind the home plate were Messrs. Bolen, Boylan, Danforth, Donecker and Schreiber, of the Public Service Railway, and Messrs. Cram, Isaacson, Matthewson, Menden and Siebert of the Brooklyn Rapid Transit System. Much excitement was caused by the efforts of Messrs. Donecker and Siebert to protect their respective hats and as first aids to the hats Mr. Donecker appointed Mr Schreiber as his bodyguard while Mr. Siebert delegated Mr. Cram to protect his interests. The defense in each case was so strong that no casualties resulted. Previous to the game Harry Bullock entertained all officers of the Public Service Railway at the Hamilton Club. Oh, Yes! The score was 6-3 in favor of Brooklyn. Roy Cram says that the teams were composed of actual employees. We know that, Roy. But how were they classed in the payrolls?

E. F. Schneider, president of the Central Electric Railway Association and general manager of the Cleveland, Southwestern & Columbus Railway, was one of the first arrivals among the delegates this year. He is accompanied by Mrs. Schneider and reached Atlantic City last Friday. He did not come entirely for the convention but is combining the trip with a vacation and expects to remain in Atlantic City for some time. It may not be generally known that Mr. Schneider was one of the very early pioneers in the present popular "safety first" movement. Long before these words were coined, Mr. Schneider was impressed with the extreme importance of taking every possible precaution against accidents and the necessity of securing not only the assistance of every railway employee but also of the public on this important matter. In consequence, he began an extended campaign of lectures to his men, the school children and the public generally on the necessity of avoiding all chance for accidents. Most of this work was done by him personally, but he also trained several assistants to help him. A number of these early lectures were printed at the time in the columns of the Electric Railway Journal and are evidences of the early date at which Mr. Schneider began this work.

S. B. Broomer, East St. Louis, of the membership committee of the Railway Storekeepers' Association, has announced that the association, which embraces a membership in nearly every country in the civilized world, has decided to encourage membership by officers of electric railways. He says that the association already includes in its membership a number of purchasing agents, general storekeepers and division storekeepers of large electric railroads. According to Mr. Broomer, the principal benefit to be derived by the electric railway men from affiliation with the association is the ability of members to secure the years of experience which steam railroad men have had along the lines of purchasing and taking care of the stock.

GETTING THE MOST FROM THE CONVENTION

One prominent railway manager at this convention has adopted a systematic plan to secure the greatest amount of good possible from it for his company. As it was impossible for the company to send to Atlantic City all of the heads of the departments which it wished, this manager asked those who were to remain at home to give him a statement of the exhibits in which they were particularly interested and the points which they would like to have him look up at the convention. In consequence, he has been visiting the booths of the different manufacturers, asking about the new developments, looking up the new apparatus and making the inquiries requested by the members of his staff. He then is planning to take this information back with him or else he requests the manufacturer to forward it direct to the staff officer.

A NEW CLAIMANT FOR THE BANNER

The broadminded policy of President C. P. King of the Washington Railway & Electric Company is well demonstrated by the large delegation of representatives in attendance, among whom are the following: W. F. Ham, R. W. King, William L. Clarke, C. S. Kimball, F. J. Whitehead, J. N. Stevens, G. G. Whitney, W. F. Dement, W. N. De Neal, E. C. Elliott, William S. Ballenger, J. W. Wenner, Charles Reich, Warren Anderson, J. E. R. Shaw and J. Tipton. All of the foregoing are members of the Washington Railway & Electric Company Section No. 4 of the American Electric Railway Association, and six of them, division superintendents, are here as guests of the company section. The Washington Railway & Electric Company, with its sixteen delegates, claims the banner for the largest delegation that has come to the convention from any part of the world east or west of the Ohio River. It challenges all rival claimants to produce, as it has done, the actual names of delegates.

LOST AND FOUND COLUMN

Lost—A lady's silver watch, with gold fob, was lost yesterday before noon, somewhere on the pier. Finder will kindly return to Mr. R. W. Spofford, room 191, Marlborough-Blenheim.

Lost—Manufacturers' Association Badge No. 4134 has been lost. Finder will kindly return to the secretary's office or to room 238, Brighton Hotel.

Lost—Badge No. 4217 of the Manufacturers' Association, belonging to E. P. Waller, General Electric Company, has been lost. Finder will please return to Electric Railway Journal booth on the pier.

MANUFACTURERS' ASSOCIATION MEETING TO-DAY

The annual meeting of the Manufacturers' Association will be held at 4 p. m. to-day, in the Engineers' Meeting Hall. Important work is carried on at these meetings and a full attendance of manufacturers' representatives is urged.

The program for to-day includes remarks by the president, a report on the condition of the association and the election of five new members of the executive committee.

To simplify the voting, it is requested that the members who will cast the votes for their respective companies will take seats on the right-hand side of the hall and other members on the left-hand side.

Samuel Insull, president of the Commonwealth Edison Company, Chicago, has recently founded for The Franklin Institute, Philadelphia, the Franklin medal, to be awarded from time to time in recognition of distinguished achievements in science and technology. The medal was designed by Dr. R. Tait McKenzie, of The University of Pennsylvania.

THE CARNIVAL TO-NIGHT

Kee-no dances, contest dances, all sorts of dances with everybody dancing, will be in the air to-night at the carnival. In the prize contest no fair dancers need fear detailed criticism, because a definite plan has been worked out by the committee for taking a ballot. The crowd as the judge will be influenced in the selection of the prize winners not only by the correctness of the steps, but also by the element of personal appeal so that it is not necessary to be an expert to win one of the prizes. Surprises will also be provided, according to the committee.

For the information of the uninitiated it may be said that the Kee-no dance originated 'way back in the dark ages before numbers other than circles were known. Each tribe, to the music of its tom-toms, went forth seeking a lucky circle. Sometimes they reached the Arctic or Antarctic circles and were never heard of again, therefore being unlucky. Others, after many wanderings, in search for this lucky figure returned to their own land and there discovered the family circle. The circle has been handed down from generation to generation through children using rings for games, hoops and wheels, and now it is found on the ballroom floor as a simple means of discovering among a great crowd those to whom Fate points kindly.

SURPRISES AT TUESDAY'S DANCE

A number of surprises were in store for those present at the informal dance last evening. Miss Edna Van Ripper, an amateur dancer, appeared in a fox trot with Mr. Stark, who introduced this dance the first of last May at the Nassau Hotel, Long Beach. The dance brought forth much applause for its ingenious steps and lively tune. Miss Burdick and Mr. Steve Matthews, Atlantic City's Own, gave their repertoire of dances and then met with a most enthusiastic reception. During the intermission, through the courtesy of the Public Service Railway of New Jersey, a picture film entitled "How Most Street Accidents Occur," was thrown on the screen at the end of the ballroom.

DAILY PRIZES FOR SKEE-BALL

Daily prizes for the highest score on the skee-ball alleys will be given beginning to-day through the courtesy of the J. D. Este Company. These will be boxes of candy to the ladies and boxes of cigars to the gentlemen. In addition there will be the grand prize that is offered by the committee for the high score for the week.

The high scores on Tuesday were as follows:

Mrs. T. W. Connette....	220	Mr. C. G. Chamberlain..	310
Mrs. W. E. Bryan.......	180	Mr. T. M. Cluley........	290
Mrs. R. M. Kerschner...	180		

The number of games rolled on Tuesday up to 6 p. m. were 3350 and at this time the crowd at the alleys was thicker than ever.

YESTERDAY'S CARD PARTIES

The first and second rounds of the auction bridge tournament, the second round not being completed, were held yesterday afternoon in the Parisian Garden, Convention Pier. These resulted in the selection of the following ladies who, together with the additional winners of the second round, will play to-day's final round for the prizes: Table 1, Mrs. W. P. Goff, Mrs. S. M. Gallaher; table 2, Mrs. P. E. Wish, Mrs. H. B. Logan; table 3, Mrs. T. Casey, Mrs. J. S. Speer; table 4, Mrs. Tenney, Mrs. Cook; table 5, Mrs. E. Dana, Miss Bright; table 6, Mrs. Thomas, Miss Hurd; table 7, Mrs. Smaw, Mrs. Sofford; table 8, Mrs. Mailand, Mrs. E. D. Priest.

Winners in second-round play not completed: Table A, Mrs. W. P. Goff, Mrs. S. M. Gallaher; table B, Mrs. Cook, Mrs. Tenney; table C, Miss Bright, Mrs. E. Dana.

The following are the winners of the "500" game: First, Mrs. J. A. Cadle; second, Mrs. A. T. Naugle; of pinochle, Mrs. J. E. Brill.

The play will start promptly at 2:30 o'clock in order to finish the second round, which time did not permit being played. Prizes will be announced for the "500" and pinochle games in connection with the announcement of winners at the auction bridge.

A SAFETY GAME

The Pittsburgh Railways, which were pioneers in the "safety first" movement, known in Pittsburgh as the "safety always" movement, have recently put into effect a new plan for interesting school children in "safety always." This is a board game which is played somewhat like parcheesi, but every part of the game has a railroad significance. It is called the "Pla-Safe" game and is intended to represent the route from the boy's home in one corner of the board to Colfax School at the other end of the board and back home again. There are 118 steps or squares on the trip out and 114 on the way home.

Each square is marked with some wording which is significant. At several points on the route the player has to cross an electric railway track. If he lands on square No. 14, which is that on the electric railway track, he is "struck by the car" and is penalized by being obliged to "go home." This means that he has to start at the beginning again. If he remains on square No. 101, which is where he crosses the steam railroad track, he is "struck by the train" and must go to the hospital for five days. This means that he must lose five turns and then must go back to square No. 82, where he is told that next time he must be more careful.

There are a number of safety squares marked in green. Each provides a certain reward, such as an advance of three squares or one more play. On the other hand, there are certain danger squares marked red, where the player is penalized by being obliged to wait for various lengths of time. Every player must stop at each danger square regardless of whether the number of the die thrown, or of the number shown on the dial spun, would carry him beyond that square.

The game is played either with dice or by spinning a dial to indicate the number of squares each player can move on each turn. Mr. Jones has several of these charts with him, and they are attracting a great deal of attention.

TUESDAY'S SESSIONS OF THE CLAIMS ASSOCIATION

Following its joint session on Tuesday morning with the Engineering and Transportation & Traffic Associations the Claims Association reconvened in the Claims Hall on the Pier, where were exhibited "safety first" lantern slides by H. B. Bennett, claim agent Fitchburg & Leominster Street Railway. Following this the Association again took up the discussion of increasing interest in the claims index bureau. Upon motion Messrs. Brown, Walsh and Rice were appointed a committee to correspond with all the member companies urging the more general use of the bureau. Secretary Davis was instructed to request Secretary Burritt of the parent association to send out reporting blanks to all member companies.

In the municipal court at Dorchester, Mass., one Foster was found guilty recently of the novel offence of unlawfully appropriating a street car. The defendant and several companions climbed aboard a River Street car of the Boston Elevated Railway at Milton Lower Mills carhouse and assumed the role of conductor and motorman, to the dismay of the passengers and distress of the local employees. After a brief "joy ride" the cries of the passengers to persons on the sidewalks led to the abandonment of the car, with the sequel of a $15 fine after the trial of the principal offender.

OPENING SESSION OF THE AMERICAN SESSION

The American Association began its annual convention yesterday afternoon in the Greek Temple. President Black called the convention to order at 2 p. m., and delivered his annual address, which appears elsewhere in this issue.

He then introduced Hon. Frank W. Stevens, chairman valuation committee, New York Central Lines, who delivered an address on "Mooted Principles in Valuation." This address will be published in a later issue of this paper.

At the conclusion of Mr. Stevens' address, Arthur W. Brady, Anderson, Ind., moved a vote of thanks to Mr. Stevens for his address. The motion was carried unanimously.

The report of the secretary-treasurer was then read. It appears in another column and was accepted and placed on file.

The report of the committee on subjects was then read. It mentioned the topics which had been selected for the current meeting. The president then called for a report of the committee on education.

EDUCATION

The report of the committee on education was presented by H. H. Norris. It appears elsewhere in this issue.

P. S. Young, Public Service Railway, Newark, asked the cause for the difference in charge for the different courses. Thus, courses *A* and *B* cost approximately $30 each, but together they cost $37. *C* and *D* cost respectively $30 and $37 each, but together they cost $45. He asked if there was any error.

Mr. Norris replied that the figures given in the report were correct. Each is based on the experience of the instruction schools, which cannot handle any course for less than $30.

Prof. V. Karapetoff, Cornell University, explained that the correspondence schools were run on the same basis as accident insurance companies. They depend upon a certain number dropping out. Again, if all of the students should send their problems to the school for correction, it would be bankrupt.

H. A. Bullock believed that it was very advisable for the electric railway companies to provide some form of educational facilities for its employees. This could be done either by the companies taking the matter up individually or as an association. The simplest way was for the association to do it and to turn it over to one of the reputable and recognized correspondence schools. Mr. Bullock traced the steps in the development of the committee's recommendations showing that the present plan is the result of study of all possible methods several other examples of which he cited.

Upon motion the report was adopted.

REPORT OF THE JOINT COMMITTEE ON THE JOINT USE OF POLES

The report of the joint committee on the joint use of poles was then presented by Mr. Harvie. This report is published elsewhere in this issue. Mr. Harvie recounted how the need for joint pole use had developed in New York State some three and a half years ago. It had been first taken up by the state association, but later the matter had been turned over to the American Association. The work had been prosecuted vigorously ever since. The proposed agreement and specification should be a compromise. He thought that the points which had come up most frequently in letters had been cared for but with optional methods, so that members or companies entering into the agreement could fill out blanks provided in the agreement in any way in which they saw fit. The principal items considered were safety and the definite location of wires and circuits. The agreement was very general and left ample latitude for individuality and the exercise of judgment in regard to local conditions, which must always obtain on any properties. He asked that the committee report be accepted and the committee discharged.

President Black then asked the secretary to read a communication from T. D. Mortimer, Milwaukee, which related to this subject. Mr. Mortimer's main point was that the impression might go forth that the proposed joint pole construction was a standard. In that event, those who used non-standard construction would have imposed upon them a heavier burden in defending legal actions. It would be unwise for a company to accept the agreement blindly without bearing in mind the exceptions required by local conditions. If strictly interpreted the adoption of the committee's report would do no harm, but the danger lurked in the separation of the recommendations of the committee from the suggested forms and in the loose reading of the report.

W. J. Harvie said he did not want anyone to feel that the joint pole agreement was intended as a standard of the association. It was simply to be considered as a suggested form subject to modifications according to individual conditions.

After further discussion it was voted that the report be received, filed and promulgated as a guide to member companies but not that it was to be understood as a standard.

The next order of business was a paper by H. C. Donecker on "Organization of a Valuation Staff." This paper appears elsewhere in this issue. The discussion on this paper was confined to Philander Betts and Henry Floy.

According to Mr. Betts, chief engineer of the Board of Public Utility Commissioners of New Jersey, the make-up of such a staff depends upon the purposes for which the valuation is made. If the purpose is to determine just and reasonable rates it is necessary not only to ascertain the reasonable cost of efficiently reproducing the existing properties, but also to determine if possible by an analysis of construction records the original cost and the revenues and expenses from the time of organization to the date of inquiry. It is especially desirable to have the inventory of the property made up by a joint force of employees of the company and the commission. On the valuation staff itself there should be engineers, accountants, operating men and men acquainted with corporation finance. The man best equipped for a complete valuation report is one with an underlying technical education, a later experience in operation and a still later administrative experience with the principles of corporation finance.

Mr. Floy stated that to follow the outline suggested by Mr. Betts was the best way for utility to undertake valuation work. He remarked, however, that the ordinary construction and operating engineer was no more fit to prepare such a valuation for a court or commission than a corporation lawyer was fitted to appear in a criminal court. Another point mentioned by Mr. Floy was that public utilities had not co-operated in valuation work. They should be more interested in all appraisals and valuations of public utility properties, even if they are not directly concerned financially.

President Black then announced the following committees:

Commitee on nominations: Arthur W. Brady, J. H. Pardee and Gen. George H. Harries.

Committee on resolutions: Charles L. Henry, John A. Beeler and Frank Hedley.

Mr. Schreiber then presented the report of the committee on company sections and individual membership. This report is published elsewhere in this issue.

The report of the committee on company membership, of which Frank Hedley is chairman, was then read by the secretary.

President Black then asked all members to be punctual in their attendance at opening of the meeting at 2 p. m. tomorrow. The meeting then adjourned.

TUESDAY'S MEETING OF THE ACCOUNTANTS' ASSOCIATION

The annual meeting of the Accountants' Association was called to order yesterday morning at 10 o'clock by its president, M. W. Glover, Mobile Light & Railroad Company. After the approval of last year's minutes, the annual address of the president, abstracted elsewhere in this issue, was read by Mr. Glover. M. R. Boylan, Public Service Railway, Newark, N. J., then read the report of the executive committee and afterward his own report as secretary-treasurer of the association, both of which were approved.

Mr. Glover read a letter from L. T. Hixson, Terre Haute, Indianapolis & Eastern Traction Company, Indianapolis, Ind., who is chairman of the committee on interline accounting, to the effect that no changes in interline business had occurred during the year sufficient to justify a report. In regard to the committee on co-operating with the United States bureau of the census, President Glover stated that it had been continued at the request of W. M. Steuart of the bureau of the census, to be called upon by the latter if so desired, but that chairman W. H. Forse, Jr., Union Traction Company of Indiana, Anderson, Ind., had advised that no report would be submitted this year except that the committee had looked over the advance copies of the census report for 1912.

The report of the committee on express and freight accounting was read by E. L. Kasemeier, Ohio Electric Railway, Springfield, Ohio, as published elsewhere in abstract form. In discussing this report O. H. Bernd, Des Moines (Iowa) City Railway, said that his company maintained a through billing arrangement with all the connecting steam railroads, and that it used all the forms recommended by the committee and a few additional ones. He believed that electric railways should conform to steam railroad forms, for the time was coming when the railroads would fully recognize electric railways in the interchange of freight traffic. W. G. Nicholson, Omaha & Council Bluffs Street Railway, Omaha, Neb., moved that the report be accepted and the motion was duly seconded and carried. W. F. Ham, Washington Railway & Electric Company, Washington, D. C., chairman of the committee representing the association at the national annual convention of railway commissioners, read his report covering the activities of the committee during the year and its experiences at that convention last year. He appended the report of the committee on electric railway statistics and accounting submitted to the National Association of Railway Commissioners at that time. Asked by President Glover to explain the connection between the two associations, Mr. Ham said that the National Association of Railway Commissioners was composed of the state and national commissioners. Steam railroad accountants many years ago were given honorary membership in this association. Ten years ago electric railway accountants got into communication with the association on the subject of uniform classification of accounts and a little later were also admitted to honorary membership. Efforts were made some years ago to consolidate into one committee the association's committees handling steam railroad and electric railway accounting problems, but in view of different conditions and the different jurisdiction of the Interstate Commerce Commission over steam lines and electric railways, the delegates of the latter class strenuously objected so that the committee on electric railway statistics and accounting was continued as a separate body. At present there is not much active interest in electric railway accounting in the National Association, but Mr. Ham believes that the Accountants' Association is fortunate in enjoying the present relations with it.

The report of the committee on the standard classification of accounts, abstracted elsewhere in this issue, was read by the chairman, H. L. Wilson, Boston, Mass., Elevated Railway. It was moved by T. P. Kilfoyle, Cleveland (Ohio) Electric Railway, and seconded by H. B. Cavanaugh, Cleveland, Southwestern & Columbus Railway, Cleveland, Ohio, that the report of the committee recommending the adoption of the Interstate Commerce Commission uniform accounting classification be accepted by the association. In response to a call by President Glover, George Geekie, examiner Interstate Commerce Commission, said that two copies each of the new classification had been sent out to 879 parties, including 800 electric railways and 79 commissions and steam railroads. From these only thirty-two or thirty-three replies had been received, although these were helpful and many were incorporated in the accounting system. Mr. Geekie remarked that the delay in getting out the system was not caused by the failure of the commission to appreciate the need of early action but was the result of an overwhelming amount of congressional work being at that time imposed upon the government printer. The commission is now working upon a new bulletin, and bulletin No. 7 is to be reissued under a new number. The cases will be placed under the same numbers but the titles of the accounts will be changed to conform to the new classification. Of the 350 cases to be included the last fifty will be important as showing decisions of the commission under the new classification. Mr. Geekie expressed the appreciation of the Interstate Commerce Commission for the assistance and co-operation that had been shown by the Electric Railway Accountants' Association, for he considered it invaluable in the promulgation of the new uniform system.

H. S. Lyon, Board of Public Utility Commissioners of New Jersey, said that the New Jersey law required the commission to follow the Interstate Commerce Commission system. In January, 1913, it adopted its own schedule for income, profit and loss, and balance sheet accounts. This is not materially different from the Interstate Commerce Commission's new classification, but changes will probably be incorporated so as to comply fully with the latter's new rules. H. C. Hasbrouck, representing the Public Service Commission for the Second District of New York, stated that while he was unable to say anything authoritative, he believed that this commission felt the classification already in use to be better suited for its purposes than the new classification. Experience had shown that a number of points in the New York system could be improved upon by revision, but no complete substitution was likely. In Mr. Hasbrouck's opinion the point most in need of revision was that of depreciation.

In reply to a question from Mr. Kilfoyle as to how many states or commissions have actually adopted the new classification, Mr. Wilson said that the new Massachusetts public utility act required the commission to conform as nearly as possible to the Interstate Commerce Commission system but that the state law made some modifications necessary. Mr. Ham read an extract from the last year's report of the committee on electric railway statistics and accounting of the National Association of Railway Commissioners to the effect that up to the beginning of the present year seventeen states and the national government had conferred upon commissions the authority to prescribe accounting systems. About one-half of these had adopted certain classifications for electric railways, although only New York, Wisconsin and Maryland had adopted complete systems. Supplementing this extract Mr. Ham remarked that twelve years ago individual companies had sacrificed their own ideas in order to secure a uniform accounting system for the association, and that now state commissions should be as willing to give up minor points in order to secure as far as possible absolute uniformity. After this discussion the question of adopting the Interstate Commerce Commission system as the official system of the Accountants' Association was carried.

In the absence of Frederic Nicholas, chairman of the committee on accounting definitions, the report of this committee was read by R. N. Wallis, Fitchburg & Leominster Street Railway, Fitchburg, Mass. An abstract of this report is published elsewhere in this issue. President Glover emphasized the importance of standardized accounting definitions and said that the committee should be continued. A motion by C. S. Mitchell, Pittsburgh (Pa.) Railways, seconded by Mr. Kilfoyle, to the effect that the report be accepted and that the committee be made a standing one, was carried.

At this point the address of the morning on "The Education of To-day" was delivered by John R. Wildman, professor of accounting, New York University School of Commerce, Accounts and Finance. Mr. Glover, after expressing his appreciation for the very instructive address and stating that all the delegates were destined to become better acquainted with Professor Wildman through his conducting the correspondence accounting course, gave a recess of five minutes for the delegates to meet him personally. It was afterward moved by Mr. Cavanaugh and seconded by W. J. Mead, Cleveland (Ohio) Railway, that the association extend a rising vote of thanks to Professor Wildman for his paper.

In the temporary absence of F. J. Pryor, Jr., American Railways, Philadelphia, Pa., Mr. Boylan read the report of the committee on education. The enrollment in the correspondence course is now of sufficient number to insure its inauguration, although Professor Wildman did not hold the committee strictly to the time limit set. The committee sent out two letters but did not endeavor to use continuous circularizing methods because it desired to be more dignified in its appeal. The demand thus far has been mainly with the smaller companies, the enrollments from the larger companies being disappointing. The prospectus of the course remains unchanged and the first lecture is to be mailed on Oct. 19. Professor Wildman left a few copies of this lecture with Mr. Pryor for distribution to interested parties. The committee expressed thanks to P. S. Young, Public Service Railway, Newark, N. J.; H. H. Norris, Electric Railway Journal, and E. B. Burritt, American Electric Railway Association, for assistance given. Mr. Wallis moved that the committee be commended for the successful completion of its work and the report was duly accepted. President Glover stated that applications for the correspondence course were available and might be taken by association members to be filled out by their employees.

Mr. Wilson recommended the election of W. B. Brockway and F. E. Smith to honorary membership in the association. After President Glover had asked for the names of other past presidents who should be similarly honored, the two candidates were elected.

Mr. Kilfoyle then mentioned the recommendations that President Glover had made in his address and the latter supplemented his former remarks by stating that the committees were in an unsettled condition upon the election of a new president, and although the executive committee had power to abolish any committees it would be advisable for the association directly to express its wishes regarding committee activity. It should say what committees should be standing and what number of members of such committees should be continued over until the next year, which in Mr. Glover's opinion should be two. Mr. Glover believed that the committee on interline accounting should be consolidated with the freight and express committee, and that there should be a standing committee on passenger accounting and three standing joint committees. It was moved by Mr. Ham and carried that the entire matter should be referred to a special committee consisting of the president, secretary and Mr. Kilfoyle to report this morning.

In reply to a question from President Glover, Mr. Wilson stated that he supposed the association would have the uniform classification printed later in complete form with cases, but that now the association might secure the classification from the government printer and sell it at a low price. Mr. Ham suggested that each member company purchase a liberal supply, at $12 a hundred copies for distribution among its employees.

L. S. Cloud, Peoples Railway, stated that his company was going to use the system of accounts adopted by the association. Upon a show of hands it developed that thirteen companies represented had adopted the Interstate Commerce Commission classification. William Hosking, Butte (Mont.) Electric Railway, said that the system used in Montana was governed by the state commission. President Glover then called upon Lloyd Lyon, who had recently returned from Spain. Mr. Lyon remarked that Spain, as the home of antiquity, was naturally deficient in accounting procedure. The chief accountants there were all foreign, mostly French or Belgian. The system of railway accounts used by Mr. Lyon's company was the uniform system of accounting adopted in 1908. For electric lighting accounts the company used a cumbersome continental standard. According to Mr. Lyon there is an annual audit made by public auditors, in some cases very complete, but in others covering only a condensed income statement and a condensed balance sheet. England, France, Belgium and Spain have no regulatory commissions and if the banks and other financial interests are satisfied with such condensed reports, Mr. Lyon deems these sufficient. The signature of the auditor is a guarantee of the correctness and proper form of the report.

President Glover appointed as the committee on resolutions G. G. Whitney, H. A. Gidney and Walter Shroyer. The following committee on nominations was appointed, R. N. Wallis, J. C. Collins, H. A. Culloden, C. Lahr and T. P. Kilfoyle. The meeting was then adjourned to meet this morning.

JOINT SESSION OF THE ENGINEERING, TRANSPORTATION AND CLAIMS ASSOCIATIONS

The joint session of the Engineering, Claims and Transportation Associations opened on Tuesday morning at 9:30 o'clock, with President W. F. Weh of the Claims Association in the chair.

The report of the board of accident prevention, of which P. C. Nickel is chairman, was the first order of business. An abstract of this report, which was read by S. B. Hare, is printed elsewhere in this issue. F. C. Henderschott, manager bureau of education New York Edison Company, then presented an address on "Accident Prevention," an abstract of which also appears in this issue.

After a vote of thanks had been extended to the authors of the communications, C. L. S. Tingley of the Accountants' Association called attention to the educational campaign of that association, particularly in securing the services of Professor Wildman, New York University, to conduct a correspondence course for employees of electric railways on both the detailed and broader aspects of accounting.

He said that to make this course permanent and efficient it was very desirable to have as many companies as possible interested in it. While enough enrollments, slightly less than 400, had been obtained to insure the course, it was desirable that as many as possible should join. Mr. Tingley then distributed some explanatory literature. Following this the delegates from the Claims Association adjourned to their own session while the meeting was continued as a joint session of the Engineering and Transportation & Traffic Associations. This meeting is reported elsewhere in this issue.

JOINT SESSION OF ENGINEERING AND TRANSPORTATION & TRAFFIC ASSOCIATIONS

The joint session of the Engineering and Transportation & Traffic Associations was called to order by Acting President Brush of the latter association on Tuesday morning at 11 o'clock. The first order of business was the report of the joint committee on block signals for electric railways, J. M. Waldron, chairman.

In presenting the report of the committee on block signals Mr. Waldron stated that a sub-committee was to work with the one from the Railway Signals Association during the next year to select from among the standards designs of the Railway Signals Association such ideas as could be properly adopted as standard by the American Electric Railway Association. This would eliminate conflicting designs with a minimum of lost time.

The two standard designs proposed by the committee, namely, a spectacle casting and a standard clearance diagram for semaphore signals were then presented to the association for its consideration. The former was approved as standard but the latter was referred back to the committee so that co-operation with the power distribution committee could be effected and certain limiting dimensions regarding the height of trolley wire could be agreed upon.

Suggested rules for signals were then approved by the association as they appeared in the committee report, and new signal rules for operation under contactor signals were approved with certain recommendations, excepting that Rule 10 appearing in the report was withdrawn by the committee for further consideration after an extended discussion. This rule dealt with the procedure when a train failed to set the signal upon entering a block.

All of the rules as changed were then approved as standards of the Engineering Association, and after this the recommendation that lenses of not less than 8⅜-in. diameter for high speed and 5⅜-in. diameter for moderate speed should be adopted as good present practice. The report as a whole was then approved and a vote of thanks was extended to the committee.

Mr. Stewart, Mahoning & Shenango Valley Railway, then read the report of the committee on transportation engineering, as abstracted elsewhere in this issue. This report was approved and the thanks of the association were extended to the committee. The meeting then adjourned.

ADDRESS OF PRESIDENT GLOVER OF THE ACCOUNTANT'S ASSOCIATION

President Glover, in opening his address yesterday before the Accountants' Association, mentioned at first the marvelous development of the electric railway industry since the association was organized on March 23, 1897. He called attention to the fact that the *Street Railway Review* was instrumental in calling the meeting of the association, and that for the last eighteen years the electric railway press had given to the association support and encouragement that was worthy of acknowledgment and appreciation.

The first suggestion made by Mr. Glover was that a rearrangement should be made of the committees so as to provide for certain standing committees and the forming of special committees from time to time as needed. He recommended that in order to secure continuity of work some members of each standing committee be held over from year to year, but that the other members be changed to bring new life and new ideas into the committee work. This suggestion, however, did not refer to the classification committee, which, in Mr. Glover's opinion, should not suffer a change in membership from year to year.

Mr. Glover said that although the Accountants' Association had adopted a uniform system of accounts, less than one-third of the electric railways in the United States used this classification as it stood. The reasons for this were that a number of state commissions prescribed different classifications, and although the association classification agreed with the Interstate Commerce Commission classification, many companies did not report to this commission and therefore were not required to use its classification. Moreover, in some cases companies were not required by law to follow any special classification. Mr. Glover believed that a uniform system of accounts should be adopted by all state commissions and companies, and he hoped that the meeting of W. F. Ham, H. J. Davies and C. L. S. Tingley with the National Association of Railway Commissioners on Nov. 17, 1914, would accomplish much good along this line.

Mr. Glover mentioned the co-operation and sympathy that had been shown between the Central Electric Railway Accountants' and the American Electric Railway Accountants' Associations during the last year on the subject of the tentative uniform system. He then took up three subjects to which he thought the association should devote attention: overhead charges, segregation of freight and passenger expenses and cost accounting. In connection with the first topic, he advised the delegates to read the address of Judge Cooley before the 1911 convention. To Mr. Glover's mind the division of expenses between freight and passenger business was of vital importance in all questions relating to rate increases, and as electric railways must secure higher prices for service or give poorer service, some plan should be devised to obtain such information. In view of the regulations recently prescribed by the Interstate Commerce Commission for a system of cost accounting to be kept showing in detail the cost of all improvements, extensions and changes of physical property, he deemed it desirable for the association to adopt a uniform cost system for maintenance expenses as well as for road and equipment expenditures. Unfortunately certain engineers were apparently unwilling to co-operate with the accounting department on this subject, but Mr. Glover stated emphatically that statements concerning the lack of value of accounting department cost data should not go unchallenged. In his opinion the best results could be obtained only through the co-operation of the two departments, and no interested department should have the right to prepare a cost statement without having it verified by the accounting department.

Mr. Glover recommended that electric railway accountants take the correspondence course arranged for by the committee on education. He also said that accountants should realize the importance of co-operation in adopting a uniform system not only of accounts but also of statistics and of methods of doing business. Such reforms as the securing of uniform monthly and annual reports would have to be and should be brought about by the accountants, but the co-operation of the three other associations should be secured.

In closing his remarks, Mr. Glover deplored instances of unjust public utility regulation, and in expressing optimism for the electric railway future quoted President Wilson's recent remarks regarding the economic indispensability of American railway systems. Mr. Glover was pleased to report that instead of the usual deficit there remained $456.75 out of the appropriation of $2,141.68 for the current year, exclusive of $136.10 properly chargeable to the previous year's expenses.

As a part of its shop equipment the Shanghai (China) Electric Construction Company, which operates an electric railway there, has installed a complete oxy-acetylene welding and cutting outfit. The company finds considerable economy in generating its own acetylene. The whole of this plant is mounted on a flat trolley which can be transferred to any part of the system. Electric arc welding is also carried out by a small plant designed by the shop staff.

TUESDAY MORNING'S SESSION OF THE TRANSPORTATION & TRAFFIC ASSOCIATION

The Tuesday morning's session of the Transportation & Traffic Association was called to order by Acting President Brush at 9:15 o'clock. The first order of business was the reading of the following communication on flagging which L. H. Palmer, chairman of the committee on rules, had received from Frank Kingsley, associate editor ELECTRIC RAILWAY JOURNAL:

In 1911 this association eliminated from the standard code old rule 203a that permitted trains to proceed under flag protection when they could not reach the despatcher. This rule was considered to be bad practice. However, it is a fact at present that at least a half-dozen interurban roads have reintroduced the old rule or its equivalent in their codes of signal rules. In a communication by John Leisenring printed in the ELECTRIC RAILWAY JOURNAL for Sept. 12, it is indicated that this has been done because conditions have changed since 1911 (owing to the wide introduction of signals) and because some such rule is necessary to avoid occasional serious interruptions to traffic by defective signals in stop position. In consequence the committee will, no doubt, agree that a definite expression of opinion should be given at once by the association to relieve the present contradictory situation.

Mr. Palmer said that the matter was a very important one, but agreed with the chair that it should be referred to the incoming committee on rules. Upon motion by Mr. Duffy the matter was disposed of by thus referring Mr. Kingsley's communication.

J. J. Dempsey, chairman, then presented the report of the committee on schedules and time-tables, an abstract of which appears elsewhere in this issue. Mr. Duffy commended the good work which this committee had done during the past five years and agreed with its recommendation that the work on schedules and time-tables should be continued in some form. He doubted whether the arbitrary stop method would be of great value in the smaller cities, although it had worked well in a fair-sized town like Rochester. As to setbacks, the schedule should be so arranged that their use should be dispensed with as far as possible.

R. E. Danforth, Newark, believed that the committee's work next year should include the problem of producing able schedule makers. There were few real schedule makers in the country, and it took much training as well as natural ability to do the work.

R. B. Stearns, Milwaukee, said that some discussions which his company had had recently with the public regulating authorities pointed out the advisability of using the term "designated stop" instead of "arbitrary stop." The use of such a word as "arbitrary" was distressing in the wrong conception that it conveyed. He also suggested that the incoming committee might well occupy its time with the construction of "base schedules," by which he meant the attempt to establish a schedule founded on the minimum service requirements to which, with the use of morning and evening gap schedules, cars could be taken from or added to the schedules at minimum expense. Seasonal changes of schedules should be sufficient and could be determined in advance.

Alexander Jackson, Public Service Railway, said the skip-stop idea had its advantages, but he thought that if the near-side stop could be standardized it would save two to three stops per mile on most properties. To save three stops per mile would save two or three minutes on a round trip which, on a two-minute headway, meant the elimination of one car and on a one and a half-minute headway the possible elimination of two cars.

Upon motion the report of the committees on schedules and time-tables was approved. The meeting was then adjourned in order to permit the joint session with the Engineering and Claims Associations which is reported elsewhere in this issue.

HOW ACCIDENTS MAY BE PREVENTED

F. C. Henderschott, manager bureau of education New York Edison Company, in his paper on the prevention of accidents before the Transportation & Traffic Association stated in substance as follows:

A casual examination of the subject of accidents in industry leads to the conclusion that conditions are indeed very serious. In the late civil war, according to figures from the adjutant general's office, the number of Union men killed in battle during the four years was 67,058. It is probable that the total number of Confederate soldiers actually killed in battle did not exceed much, if any, the losses of the Union forces, but the most conservative estimate places the total of persons killed by accident in the United States, at the present time, at not less than 75,000 in a single year.

The 1913 report of United States Commissioner of Labor, Hon. Charles P. Neill, upon the conditions of employment in the iron and steel industry states:

"On the one hand for a large group of plants in which the work of organized accident prevention is well developed, the rate falls as low as 167.1 per thousand 300-day workers, while at the other extreme for a group of plants in which organized safety work has not yet been developed, the rate rises to 507.9 per thousand, and in the case of individual plants in the group considerably higher." This is a reduction of 67.1 per cent, or of two accidents out of every three.

To quote Arthur Williams, president of the American Museum of Safety: "No measure of value can be applied to the suffering of individuals who are injured or to the anguish of those who have lost relatives through industrial accidents. There is not only this immediate economic loss, but that which accrues in the future to dependents who, as a result of accident, are left without the means of either sustenance or education. The grief and pain arising from deaths and permanent disabilities wrought from this country's industries, and from carelessness outside of industry—as, for example, upon our highways—far exceed any suffering or sacrifice of life that have occurred or ever could happen through war."

Again he says, in a recent discussion of the subject of industrial accidents: "Perhaps not sentimentally, but practically, human health and life have been held most cheap, not only in our country's industrial development, but in our social order as well. And until recently in industry the most ordinary physical and sanitary precautions have been lacking; in social life we have permitted the development of slums—breeding spots of unhappiness, disease and crime; in our entire industrial system we have neglected to the utmost degree essential elementary protection of health and life."

That Mr. Williams has not overdrawn the picture is proved when we turn to some recent reports by corporations of accomplishments they have made, along the line of accident reduction, during the past year.

The bureau of efficiency of the Northern Pacific Railway, while but a little more than a year old, was able to reduce deaths due to operating accidents on that railway system during the first six months of 1914 as compared with a similar period of 1913 by 73 per cent. The Carnegie Steel Company has been able to reduce its accidents about 71 per cent. Reports from many other industrial corporations lead to the conclusion that it is possible to reduce accidents, where no effort has yet been made in this direction, anywhere from 80 per cent down to 20 per cent, according to the character of the business.

But, as J. L. Murrie, safety engineer, and J. C. Robinson, chief of the bureau of adjustment of The New York Edison Company, have pointed out in a recent paper on "Safety in the Electric Light Industry": "No device ever has been invented and none ever will be invented that will operate with unvarying success, under all conditions in saving life or limb. The human equation enters too strongly into the proposition and must not be ignored or eliminated. Intelligent co-operation by the employee is a vital essential, and such co-operation is the gospel we must preach. We may reach the extreme limit of ingenuity in the making of a machine that protects a man against danger, but if no mental impulse be exerted the danger is not averted. We can demonstrate the peril of the live wire and the protective value of the rubber glove, but without co-operation between the human mental and the physical material, the warning as to the one and the advice as to the other are alike useless."

In the New York Edison Company 85 per cent of accidents are due to employees, carelessness or negligence, 6 per cent due to carelessness of fellow-servants, 2 per cent due to outside contractors and 7 per cent are chargeable to the company.

The Au Sable Electric Company of Michigan, in a recent report, states that 75 per cent of the accidents in that company are due to carelessness, and Mr. Williams in a recent summary, based, no doubt, upon data gathered by the American Museum of Safety, states that: "Between 70 per cent and 90 per cent of all accidents are the result not of physical defects in our urban industries relating, say, to manufacture, transportation and kindred subjects, but to carelessness and oversight on the part of persons injured, their fellow-workers, or those in control of the means of injury."

The subject of accident prevention was first approached largely from the standpoint of safeguarding machinery. For some time industry devoted its efforts toward accident prevention largely along this line. But the Westinghouse Electric & Manufacturing Company, in a report for 1913, showed that less than 0.5 per cent of the accidents occurring in its plant was due to lack of safeguarding. In this report, Dr. Lauffer attributed a goodly proportion of the accidents directly to the influence of the saloon and predicts that the present generation will wipe out the saloon.

It is not my purpose to discuss prohibition, but surely no analysis of the causes of industrial accidents, deaths and disease would be complete without reference to the evil influence of the intemperate use of liquor. And industry has not been slow in recent years to recognize this fact. Many of the large railroad companies prohibit the sale of liquor upon their trains, and any employee seen in an intoxicated condition is immediately discharged. It is perhaps due, at least in some degree, to the fact that transportation companies have taken this stand, that some of the larger transportation systems have not killed a single passenger in the past five years. But while this condition is gratifying, we are disheartened when we learn that 25,000 children under eighteen years of age have been killed upon railroad tracks during the past twenty years. It is not the fault of the transportation companies that children are upon their tracks, and this leads to the inevitable conclusion that accidents and deaths cannot be reduced to the minimum until there is co-operation upon the part of the public, upon the part of the press, the pulpit, educational institutions and all along the line.

Physical examination of employees is already playing an important part in the reduction of industrial accidents. Dr. Lauffer, in the report, says: "In our opinion the good health campaign is more result-producing in the line of accident prevention than much additional safeguarding of machines."

In a paper on "safety first," presented before the last convention of the National Electric Light Association, Paul Lupke pointed out two important facts. "Newspaper men and other publishers and writers know that the people do not learn facts and arguments on any subject by one announcement, and that it needs constant effort of iteration and reiteration to send the matter home to the people it is wished to reach." And the second point: "The greatest factor operating toward the prevention of accidents is not the prevention device but the 'prevention spirit'."

Several years ago a commission appointed by the federal government visited the big manufacturing industries of Germany, and it was shown by a tabulation of 80,000 cases investigated by them that 80 per cent to 84 per cent of the total number of accidents were chargeable to the employees. This would seem to indicate that about the same degree of negligence on the part of the employees exists the world over; that it is one of the chief characteristics of human nature to be careless.

It is obvious in a paper to consume but twenty minutes very little detail can be given. However, the picture is not so dark as it might appear at first glance. In excess of 1000 industrial institutions have instituted accident prevention systems in the industries of the United States, and while the annual toll paid by this country on account of industrial accident amounts, at the present time, to in excess of $250,000,000 exclusive of loss of time and efficiency of those injured, a good beginning has been made in the direction of improvement.

Recognition has been accorded to the safety engineer and to his collaborator, the efficiency engineer. Industrial corporations are beginning to add the third, and perhaps the most important factor in the entire movement, the educational engineer. More than eighty industrial institutions, including among the number several of the larger railway systems, the larger manufacturing companies, financial, insurance, publishing and retailing institutions have established educational courses on behalf of their employees, and in connection with the better training systems compulsory physical examination is being urged, and due recognition is being given to fatigue, intemperance, worry and the other contributory causes to accidents, diseases and death.

A campaign designed to prevent accidents must be based upon the natural tendency of the human being to be careless. To be effective, the work must be carried on with enthusiasm but not spasmodically.

Since instruction on the subject of safety, by lectures, was introduced into the schools of New Jersey, accidents to school children for the six months ending Sept. 1, 1912, were 44 per cent less than they were during the same period in the previous year.

Once instituted, the safety department of a corporation should be considered a permanent feature and the effort should not be allowed to lapse. This association can render no more valuable service to its members and to the public than by placing its prestige squarely behind its safety board and to co-operate with similar committees from other organizations to the end that industrial accidents, industrial disease and untimely deaths shall be reduced to the lowest possible number throughout the industries of the United States.

HOWLING FROM THE HOUSE-TOP

Electric Railway Service, published in the interest of the Detroit United Railway for general distribution, recently contained the following item which will be of interest to electric railway men generally:

"W. H. Woodbury, whoever he is, writes the Detroit *Journal* calling the attention of people to the fall styles of ladies' hosiery as revealed during the entrance to and exit from Detroit street cars. If such inspection constitutes Mr. Woodbury's form of entertainment he should not endeavor to divert the attention of others from their work."

PRESIDENT BLACK'S ADDRESS TO THE AMERICAN ASSOCIATION

The past year has been a strenuous one for the majority of our members. Our industry is passing through a most crucial and critical period, not so much by reason of any changes in the art of transportation as because of the attitude of the general public towards all public utilities, as well as from the problems arising through the evolution of governmental regulation. And now we have added to the above the serious economic conditions resulting from the European war. But I cannot help feeling greatly impressed with the vigor and enthusiasm of the men engaged in the electric railway industry; they have met and overcome the difficulties of the past and will unquestionably be able successfully to cope with those of the future.

During the past twenty-five years we have witnessed an industrial development unparalleled in the world's history, and no factor in this development has played a more important part than the electric railway. Cities have been enabled to expand their boundaries far beyond what was deemed possible before the advent of the trolley car, thus eliminating to a great extent the congestion so common to the cities of the old world, and making it possible for workers to find comfortable homes at reasonable cost in the suburbs. For every dollar of profit realized from electric railways, the community at large has gained at least one hundred dollars in taxable values, while the individual owners of suburban real estate have enjoyed increases in the so-called unearned increment aggregating enormous sums.

These results have been brought about largely through the establishment in this country of a flat 5-cent fare, or less, enabling a passenger to travel from any one point in a city to any other regardless of the distance, and, in fact, oftentimes to points far beyond the corporate limits. Owing to the undeveloped system of accounting generally in use by electric railways, and the more than vague ideas of the actual cost of the service, the fact that this long-haul travel was carried on at a considerable loss was far from realized until a comparatively recent period. The more the public received the more it demanded, and at the same time there commenced to be a marked decrease in the value of the token or fare received.

Finally, in 1910, the association appointed a committee to report on the proper basis of rates and fares, which committee was succeeded in 1912 by the committee on cost of transportation. This committee reported to the 1913 convention, recommending the establishment of a bureau of fare research, which culminated in the appointment, on May 1 of this year, of F. W. Doolittle as director of the bureau to work under the direction of the committee on cost of transportation. Mr. Doolittle, from his education and past experience, is peculiarly fitted for the work he has undertaken. An idea of the scope of this work and of its importance and value can be gained by reference to the June, 1914, *Aera.*

THE COMMITTEE ON PUBLIC RELATIONS

When you bestowed upon me at our last convention the honor of the presidency of the association, it devolved upon me not only to direct through its committees and officers what might be styled the routine work, but also, if possible, to enlarge the value of the association to its members.

It appeared to me that no more fertile field presented itself than that occupied by the committee on public relations. This was a regular committee of the association, and had been in existence for a number of years, but its work had been more ornamental than useful.

In the past the association has never experienced any difficulty in finding men for the various committees who were fully capable of dealing with the problems which have arisen from time to time. But the question of public relations is very different from the subjects generally considered by these committees, and the ideas of even those men who had given the matter the most careful and thorough study were vague and indefinite. Everyone recognized the fact that our public relations were in a most unsatisfactory condition and that the improvement of this condition was of vital importance to the industry. But how to tackle the problem was another question. It seemed to me, therefore, important that we should call upon the very best talent at our command, and a committee was appointed, including not only representatives of the electric railways proper but also men from the manufacturing, banking and engineering interests who are identified with our industry. Thomas N. McCarter, president of the Public Service Corporation of New Jersey, was appointed chairman.

Several meetings have been held during the past year and, on the evening of Jan. 29 Mr. McCarter gave a dinner to the members of his committee and also had as his guests several members of the public policy committee of the National Electric Light Association and other gentlemen identified with public utilities.

The results of the discussion which followed the dinner, and of the several meetings of the committee which have been held, are crystallized in the code of principles embodied in the report of the committee to the association, and which it is confidently expected all members of the association will heartily indorse.

The report also recommends the establishment by the association of a bureau of public relations and outlines a comprehensive plan for a publicity and educational campaign which, I trust, will receive most careful thought and study.

While it may not be practicable, under the existing financial stress, for the association to raise any large sum of money to carry out the broader plan outlined, the member companies can and should start the ball rolling in their own localities. The association can point the way and make suggestions and furnish ammunition, but all of these will be in vain, unless the member companies themselves take hold of their own local problems. Electric railways have one peculiar advantage over all other public utilities in the fact that their employees, the motormen and conductors, come into close and intimate daily contact with the public. Here is a tool ready at hand to commence the work which every electric railway should make use of. But, first, it is absolutely essential to establish cordial and harmonious relations between the companies and their employees.

By the establishment of company sections, two important objects will be attained: first, the employees of the company can and will be brought into closer and more intimate contact with the general officers and will obtain a much more comprehensive understanding of their duties, which will result in greater loyalty to the company and better service to the public; second, the individual membership of the association will be materially increased, thus adding strength through members to the organization, as well as increasing its financial resources.

PROPOSED INCREASE IN DUES

In connection with this last matter, I desire particularly to call your attention to the report and recommendations of the executive committee contained in the circular letter dated Sept. 10, 1914, which was sent to all of the company members, and the approval of which I strongly urge. As the work of the association broadens, its usefulness to its members increases. We now have 400 electric railways enrolled, representing approximately 90 per cent of the capital invested in the business, and we cannot hope for any material increase in dues from new company members. The revised schedule of dues will provide about $16,000 of additional revenue, which will enable the association to meet the added expenses incurred in connection with the estab-

THE CARNIVAL TO-NIGHT

Kee-no dances, contest dances, all sorts of dances with everybody dancing, will be in the air to-night at the carnival. In the prize contest no fair dancers need fear detailed criticism, because a definite plan has been worked out by the committee for taking a ballot. The crowd as the judge will be influenced in the selection of the prize winners not only by the correctness of the steps, but also by the element of personal appeal so that it is not necessary to be an expert to win one of the prizes. Surprises will also be provided, according to the committee.

For the information of the uninitiated it may be said that the Kee-no dance originated 'way back in the dark ages before numbers other than circles were known. Each tribe, to the music of its tom-toms, went forth seeking a lucky circle. Sometimes they reached the Arctic or Antarctic circles and were never heard of again, therefore being unlucky. Others, after many wanderings, in search for this lucky figure returned to their own land and there discovered the family circle. The circle has been handed down from generation to generation through children using rings for games, hoops and wheels, and now it is found on the ballroom floor as a simple means of discovering among a great crowd those to whom Fate points kindly.

SURPRISES AT TUESDAY'S DANCE

A number of surprises were in store for those present at the informal dance last evening. Miss Edna Van Ripper, an amateur dancer, appeared in a fox trot with Mr. Stark, who introduced this dance the first of last May at the Nassau Hotel, Long Beach. The dance brought forth much applause for its ingenious steps and lively tune. Miss Burdick and Mr. Steve Matthews, Atlantic City's Own, gave their repertoire of dances and then met with a most enthusiastic reception. During the intermission, through the courtesy of the Public Service Railway of New Jersey, a picture film entitled "How Most Street Accidents Occur," was thrown on the screen at the end of the ballroom.

DAILY PRIZES FOR SKEE-BALL

Daily prizes for the highest score on the skee-ball alleys will be given beginning to-day through the courtesy of the J. D. Este Company. These will be boxes of candy to the ladies and boxes of cigars to the gentlemen. In addition there will be the grand prize that is offered by the committee for the high score for the week.

The high scores on Tuesday were as follows:

Mrs. T. W. Connette....	220	Mr. C. G. Chamberlain..	310
Mrs. W. E. Bryan.......	180	Mr. T. M. Cluley........	290
Mrs. R. M. Kerschner...	180		

The number of games rolled on Tuesday up to 6 p. m. were 3350 and at this time the crowd at the alleys was thicker than ever.

YESTERDAY'S CARD PARTIES

The first and second rounds of the auction bridge tournament, the second round not being completed, were held yesterday afternoon in the Parisian Garden, Convention Pier. These resulted in the selection of the following ladies who, together with the additional winners of the second round, will play to-day's final round for the prizes: Table 1, Mrs. W. P. Goff, Mrs. S. M. Gallaher; table 2, Mrs. P. E. Wish, Mrs. H. B. Logan; table 3, Mrs. T. Casey, Mrs. J. S. Speer; table 4, Mrs. Tenney, Mrs. Cook; table 5, Mrs. E. Dana, Miss Bright; table 6, Mrs. Thomas, Miss Hurd; table 7, Mrs. Smaw, Mrs. Sofford; table 8, Mrs. Mailand, Mrs. E. D. Priest.

Winners in second-round play not completed: Table A, Mrs. W. P. Goff, Mrs. S. M. Gallaher; table B, Mrs. Cook Mrs. Tenney; table C, Miss Bright, Mrs. E. Dana.

The following are the winners of the "500" game: First, Mrs. J. A. Cadle; second, Mrs. A. T. Naugle; of pinochle, Mrs. J. E. Brill.

The play will start promptly at 2:30 o'clock in order to finish the second round, which time did not permit being played. Prizes will be announced for the "500" and pinochle games in connection with the announcement of winners at the auction bridge.

A SAFETY GAME

The Pittsburgh Railways, which were pioneers in the "safety first" movement, known in Pittsburgh as the "safety always" movement, have recently put into effect a new plan for interesting school children in "safety always." This is a board game which is played somewhat like parcheesi, but every part of the game has a railroad significance. It is called the "Pla-Safe" game and is intended to represent the route from the boy's home in one corner of the board to Colfax School at the other end of the board and back home again. There are 118 steps or squares on the trip out and 114 on the way home.

Each square is marked with some wording which is significant. At several points on the route the player has to cross an electric railway track. If he lands on square No. 14, which is that on the electric railway track, he is "struck by the car" and is penalized by being obliged to "go home." This means that he has to start at the beginning again. If he remains on square No. 101, which is where he crosses the steam railroad track, he is "struck by the train" and must go to the hospital for five days. This means that he must lose five turns and then must go back to square No. 82, where he is told that next time he must be more careful.

There are a number of safety squares marked in green. Each provides a certain reward, such as an advance of three squares or one more play. On the other hand, there are certain danger squares marked red, where the player is penalized by being obliged to wait for various lengths of time. Every player must stop at each danger square regardless of whether the number of the die thrown, or of the number shown on the dial spun, would carry him beyond that square.

The game is played either with dice or by spinning a dial to indicate the number of squares each player can move on each turn. Mr. Jones has several of these charts with him, and they are attracting a great deal of attention.

TUESDAY'S SESSIONS OF THE CLAIMS ASSOCIATION

Following its joint session on Tuesday morning with the Engineering and Transportation & Traffic Associations the Claims Association reconvened in the Claims Hall on the Pier, where were exhibited "safety first" lantern slides by H. B. Bennett, claim agent Fitchburg & Leominster Street Railway. Following this the Association again took up the discussion of increasing interest in the claims index bureau. Upon motion Messrs. Brown, Walsh and Rice were appointed a committee to correspond with all the member companies urging the more general use of the bureau. Secretary Davis was instructed to request Secretary Burritt of the parent association to send out reporting blanks to all member companies.

In the municipal court at Dorchester, Mass., one Foster was found guilty recently of the novel offence of unlawfully appropriating a street car. The defendant and several companions climbed aboard a River Street car of the Boston Elevated Railway at Milton Lower Mills carhouse and assumed the role of conductor and motorman, to the dismay of the passengers and distress of the local employees. After a brief "joy ride" the cries of the passengers to persons on the sidewalks led to the abandonment of the car, with the sequel of a $15 fine after the trial of the principal offender.

OPENING SESSION OF THE AMERICAN SESSION

The American Association began its annual convention yesterday afternoon in the Greek Temple. President Black called the convention to order at 2 p. m., and delivered his annual address, which appears elsewhere in this issue.

He then introduced Hon. Frank W. Stevens, chairman valuation committee, New York Central Lines, who delivered an address on "Mooted Principles in Valuation." This address will be published in a later issue of this paper.

At the conclusion of Mr. Stevens' address, Arthur W. Brady, Anderson, Ind., moved a vote of thanks to Mr. Stevens for his address. The motion was carried unanimously.

The report of the secretary-treasurer was then read. It appears in another column and was accepted and placed on file.

The report of the committee on subjects was then read. It mentioned the topics which had been selected for the current meeting. The president then called for a report of the committee on education.

EDUCATION

The report of the committee on education was presented by H. H. Norris. It appears elsewhere in this issue.

P. S. Young, Public Service Railway, Newark, asked the cause for the difference in charge for the different courses. Thus, courses *A* and *B* cost approximately $30 each, but together they cost $37. *C* and *D* cost respectively $30 and $37 each, but together they cost $45. He asked if there was any error.

Mr. Norris replied that the figures given in the report were correct. Each is based on the experience of the instruction schools, which cannot handle any course for less than $30.

Prof. V. Karapetoff, Cornell University, explained that the correspondence schools were run on the same basis as accident insurance companies. They depend upon a certain number dropping out. Again, if all of the students should send their problems to the school for correction, it would be bankrupt.

H. A. Bullock believed that it was very advisable for the electric railway companies to provide some form of educational facilities for its employees. This could be done either by the companies taking the matter up individually or as an association. The simplest way was for the association to do it and to turn it over to one of the reputable and recognized correspondence schools. Mr. Bullock traced the steps in the development of the committee's recommendations showing that the present plan is the result of study of all possible methods several other examples of which he cited.

Upon motion the report was adopted.

REPORT OF THE JOINT COMMITTEE ON THE JOINT USE OF POLES

The report of the joint committee on the joint use of poles was then presented by Mr. Harvie. This report is published elsewhere in this issue. Mr. Harvie recounted how the need for joint pole use had developed in New York State some three and a half years ago. It had been first taken up by the state association, but later the matter had been turned over to the American Association. The work had been prosecuted vigorously ever since. The proposed agreement and specification should be a compromise. He thought that the points which had come up most frequently in letters had been cared for but with optional methods, so that members or companies entering into the agreement could fill out blanks provided in the agreement in any way in which they saw fit. The principal items considered were safety and the definite location of wires and circuits. The agreement was very general and left ample latitude for individuality and the exercise of judgment in regard to local conditions, which must always obtain on any properties. He asked that the committee report be accepted and the committee discharged.

President Black then asked the secretary to read a communication from T. D. Mortimer, Milwaukee, which related to this subject. Mr. Mortimer's main point was that the impression might go forth that the proposed joint pole construction was a standard. In that event, those who used non-standard construction would have imposed upon them a heavier burden in defending legal actions. It would be unwise for a company to accept the agreement blindly without bearing in mind the exceptions required by local conditions. If strictly interpreted the adoption of the committee's report would do no harm, but the danger lurked in the separation of the recommendations of the committee from the suggested forms and in the loose reading of the report.

W. J. Harvie said he did not want anyone to feel that the joint pole agreement was intended as a standard of the association. It was simply to be considered as a suggested form subject to modifications according to individual conditions.

After further discussion it was voted that the report be received, filed and promulgated as a guide to member companies but not that it was to be understood as a standard.

The next order of business was a paper by H. C. Donecker on "Organization of a Valuation Staff." This paper appears elsewhere in this issue. The discussion on this paper was confined to Philander Betts and Henry Floy.

According to Mr. Betts, chief engineer of the Board of Public Utility Commissioners of New Jersey, the make-up of such a staff depends upon the purposes for which the valuation is made. If the purpose is to determine just and reasonable rates it is necessary not only to ascertain the reasonable cost of efficiently reproducing the existing properties, but also to determine if possible by an analysis of construction records the original cost and the revenues and expenses from the time of organization to the date of inquiry. It is especially desirable to have the inventory of the property made up by a joint force of employees of the company and the commission. On the valuation staff itself there should be engineers, accountants, operating men and men acquainted with corporation finance. The man best equipped for a complete valuation report is one with an underlying technical education, a later experience in operation and a still later administrative experience with the principles of corporation finance.

Mr. Floy stated that to follow the outline suggested by Mr. Betts was the best way for utility to undertake valuation work. He remarked, however, that the ordinary construction and operating engineer was no more fit to prepare such a valuation for a court or commission than a corporation lawyer was fitted to appear in a criminal court. Another point mentioned by Mr. Floy was that public utilities had not co-operated in valuation work. They should be more interested in all appraisals and valuations of public utility properties, even if they are not directly concerned financially.

President Black then announced the following committees:

Commitee on nominations: Arthur W. Brady, J. H. Pardee and Gen. George H. Harries.

Committee on resolutions: Charles L. Henry, John A. Beeler and Frank Hedley.

Mr. Schreiber then presented the report of the committee on company sections and individual membership. This report is published elsewhere in this issue.

The report of the committee on company membership, of which Frank Hedley is chairman, was then read by the secretary.

President Black then asked all members to be punctual in their attendance at opening of the meeting at 2 p. m. tomorrow. The meeting then adjourned.

TUESDAY'S MEETING OF THE ACCOUNTANTS' ASSOCIATION

The annual meeting of the Accountants' Association was called to order yesterday morning at 10 o'clock by its president, M. W. Glover, Mobile Light & Railroad Company. After the approval of last year's minutes, the annual address of the president, abstracted elsewhere in this issue, was read by Mr. Glover. M. R. Boylan, Public Service Railway, Newark, N. J., then read the report of the executive committee and afterward his own report as secretary-treasurer of the association, both of which were approved.

Mr. Glover read a letter from L. T. Hixson, Terre Haute, Indianapolis & Eastern Traction Company, Indianapolis, Ind., who is chairman of the committee on interline accounting, to the effect that no changes in interline business had occurred during the year sufficient to justify a report. In regard to the committee on co-operating with the United States bureau of the census, President Glover stated that it had been continued at the request of W. M. Steuart of the bureau of the census, to be called upon by the latter if so desired, but that chairman W. H. Forse, Jr., Union Traction Company of Indiana, Anderson, Ind., had advised that no report would be submitted this year except that the committee had looked over the advance copies of the census report for 1912.

The report of the committee on express and freight accounting was read by E. L. Kasemeier, Ohio Electric Railway, Springfield, Ohio, as published elsewhere in abstract form. In discussing this report O. H. Bernd, Des Moines (Iowa) City Railway, said that his company maintained a through billing arrangement with all the connecting steam railroads, and that it used all the forms recommended by the committee and a few additional ones. He believed that electric railways should conform to steam railroad forms, for the time was coming when the railroads would fully recognize electric railways in the interchange of freight traffic. W. G. Nicholson, Omaha & Council Bluffs Street Railway, Omaha, Neb., moved that the report be accepted and the motion was duly seconded and carried. W. F. Ham, Washington Railway & Electric Company, Washington, D. C., chairman of the committee representing the association at the national annual convention of railway commissioners, read his report covering the activities of the committee during the year and its experiences at that convention last year. He appended the report of the committee on electric railway statistics and accounting submitted to the National Association of Railway Commissioners at that time. Asked by President Glover to explain the connection between the two associations, Mr. Ham said that the National Association of Railway Commissioners was composed of the state and national commissioners. Steam railroad accountants many years ago were given honorary membership in this association. Ten years ago electric railway accountants got into communication with the association on the subject of uniform classification of accounts and a little later were also admitted to honorary membership. Efforts were made some years ago to consolidate into one committee the association's committees handling steam railroad and electric railway accounting problems, but in view of different conditions and the different jurisdiction of the Interstate Commerce Commission over steam lines and electric railways, the delegates of the latter class strenuously objected so that the committee on electric railway statistics and accounting was continued as a separate body. At present there is not much active interest in electric railway accounting in the National Association, but Mr. Ham believes that the Accountants' Association is fortunate in enjoying the present relations with it.

The report of the committee on the standard classification of accounts, abstracted elsewhere in this issue, was read by the chairman, H. L. Wilson, Boston, Mass., Elevated Railway. It was moved by T. P. Kilfoyle, Cleveland (Ohio) Electric Railway, and seconded by H. B. Cavanaugh, Cleveland, Southwestern & Columbus Railway, Cleveland, Ohio, that the report of the committee recommending the adoption of the Interstate Commerce Commission uniform accounting classification be accepted by the association. In response to a call by President Glover, George Geekie, examiner Interstate Commerce Commission, said that two copies each of the new classification had been sent out to 879 parties, including 800 electric railways and 79 commissions and steam railroads. From these only thirty-two or thirty-three replies had been received, although these were helpful and many were incorporated in the accounting system. Mr. Geekie remarked that the delay in getting out the system was not caused by the failure of the commission to appreciate the need of early action but was the result of an overwhelming amount of congressional work being at that time imposed upon the government printer. The commission is now working upon a new bulletin, and bulletin No. 7 is to be reissued under a new number. The cases will be placed under the same numbers but the titles of the accounts will be changed to conform to the new classification. Of the 350 cases to be included the last fifty will be important as showing decisions of the commission under the new classification. Mr. Geekie expressed the appreciation of the Interstate Commerce Commission for the assistance and co-operation that had been shown by the Electric Railway Accountants' Association, for he considered it invaluable in the promulgation of the new uniform system.

H. S. Lyon, Board of Public Utility Commissioners of New Jersey, said that the New Jersey law required the commission to follow the Interstate Commerce Commission system. In January, 1913, it adopted its own schedule for income, profit and loss, and balance sheet accounts. This is not materially different from the Interstate Commerce Commission's new classification, but changes will probably be incorporated so as to comply fully with the latter's new rules. H. C. Hasbrouck, representing the Public Service Commission for the Second District of New York, stated that while he was unable to say anything authoritative, he believed that this commission felt the classification already in use to be better suited for its purposes than the new classification. Experience had shown that a number of points in the New York system could be improved upon by revision, but no complete substitution was likely. In Mr. Hasbrouck's opinion the point most in need of revision was that of depreciation.

In reply to a question from Mr. Kilfoyle as to how many states or commissions have actually adopted the new classification, Mr. Wilson said that the new Massachusetts public utility act required the commission to conform as nearly as possible to the Interstate Commerce Commission system but that the state law made some modifications necessary. Mr. Ham read an extract from the last year's report of the committee on electric railway statistics and accounting of the National Association of Railway Commissioners to the effect that up to the beginning of the present year seventeen states and the national government had conferred upon commissions the authority to prescribe accounting systems. About one-half of these had adopted certain classifications for electric railways, although only New York, Wisconsin and Maryland had adopted complete systems. Supplementing this extract Mr. Ham remarked that twelve years ago individual companies had sacrificed their own ideas in order to secure a uniform accounting system for the association, and that now state commissions should be as willing to give up minor points in order to secure as far as possible absolute uniformity. After this discussion the question of adopting the Interstate Commerce Commission system as the official system of the Accountants' Association was carried.

In the absence of Frederic Nicholas, chairman of the committee on accounting definitions, the report of this committee was read by R. N. Wallis, Fitchburg & Leominster Street Railway, Fitchburg, Mass. An abstract of this report is published elsewhere in this issue. President Glover emphasized the importance of standardized accounting definitions and said that the committee should be continued. A motion by C. S. Mitchell, Pittsburgh (Pa.) Railways, seconded by Mr. Kilfoyle, to the effect that the report be accepted and that the committee be made a standing one, was carried.

At this point the address of the morning on "The Education of To-day" was delivered by John R. Wildman, professor of accounting, New York University School of Commerce, Accounts and Finance. Mr. Glover, after expressing his appreciation for the very instructive address and stating that all the delegates were destined to become better acquainted with Professor Wildman through his conducting the correspondence accounting course, gave a recess of five minutes for the delegates to meet him personally. It was afterward moved by Mr. Cavanaugh and seconded by W. J. Mead, Cleveland (Ohio) Railway, that the association extend a rising vote of thanks to Professor Wildman for his paper.

In the temporary absence of F. J. Pryor, Jr., American Railways, Philadelphia, Pa., Mr. Boylan read the report of the committee on education. The enrollment in the correspondence course is now of sufficient number to insure its inauguration, although Professor Wildman did not hold the committee strictly to the time limit set. The committee sent out two letters but did not endeavor to use continuous circularizing methods because it desired to be more dignified in its appeal. The demand thus far has been mainly with the smaller companies, the enrollments from the larger companies being disappointing. The prospectus of the course remains unchanged and the first lecture is to be mailed on Oct. 19. Professor Wildman left a few copies of this lecture with Mr. Pryor for distribution to interested parties. The committee expressed thanks to P. S. Young, Public Service Railway, Newark, N. J.; H. H. Norris, Electric Railway Journal, and E. B. Burritt, American Electric Railway Association, for assistance given. Mr. Wallis moved that the committee be commended for the successful completion of its work and the report was duly accepted. President Glover stated that applications for the correspondence course were available and might be taken by association members to be filled out by their employees.

Mr. Wilson recommended the election of W. B. Brockway and F. E. Smith to honorary membership in the association. After President Glover had asked for the names of other past presidents who should be similarly honored, the two candidates were elected.

Mr. Kilfoyle then mentioned the recommendations that President Glover had made in his address and the latter supplemented his former remarks by stating that the committees were in an unsettled condition upon the election of a new president, and although the executive committee had power to abolish any committees it would be advisable for the association directly to express its wishes regarding committee activity. It should say what committees should be standing and what number of members of such committees should be continued over until the next year, which in Mr. Glover's opinion should be two. Mr. Glover believed that the committee on interline accounting should be consolidated with the freight and express committee, and that there should be a standing committee on passenger accounting and three standing joint committees. It was moved by Mr. Ham and carried that the entire matter should be referred to a special committee consisting of the president, secretary and Mr. Kilfoyle to report this morning.

In reply to a question from President Glover, Mr. Wilson stated that he supposed the association would have the uniform classification printed later in complete form with cases, but that now the association might secure the classification from the government printer and sell it at a low price. Mr. Ham suggested that each member company purchase a liberal supply, at $12 a hundred copies for distribution among its employees.

L. S. Cloud, Peoples Railway, stated that his company was going to use the system of accounts adopted by the association. Upon a show of hands it developed that thirteen companies represented had adopted the Interstate Commerce Commission classification. William Hosking, Butte (Mont.) Electric Railway, said that the system used in Montana was governed by the state commission. President Glover then called upon Lloyd Lyon, who had recently returned from Spain. Mr. Lyon remarked that Spain, as the home of antiquity, was naturally deficient in accounting procedure. The chief accountants there were all foreign, mostly French or Belgian. The system of railway accounts used by Mr. Lyon's company was the uniform system of accounting adopted in 1908. For electric lighting accounts the company used a cumbersome continental standard. According to Mr. Lyon there is an annual audit made by public auditors, in some cases very complete, but in others covering only a condensed income statement and a condensed balance sheet. England, France, Belgium and Spain have no regulatory commissions and if the banks and other financial interests are satisfied with such condensed reports, Mr. Lyon deems these sufficient. The signature of the auditor is a guarantee of the correctness and proper form of the report.

President Glover appointed as the committee on resolutions G. G. Whitney, H. A. Gidney and Walter Shroyer. The following committee on nominations was appointed, R. N. Wallis, J. C. Collins, H. A. Culloden, C. Lahr and T. P. Kilfoyle. The meeting was then adjourned to meet this morning.

JOINT SESSION OF THE ENGINEERING, TRANSPORTATION AND CLAIMS ASSOCIATIONS

The joint session of the Engineering, Claims and Transportation Associations opened on Tuesday morning at 9:30 o'clock, with President W. F. Weh of the Claims Association in the chair.

The report of the board of accident prevention, of which P. C. Nickel is chairman, was the first order of business. An abstract of this report, which was read by S. B. Hare, is printed elsewhere in this issue. F. C. Henderschott, manager bureau of education New York Edison Company, then presented an address on "Accident Prevention," an abstract of which also appears in this issue.

After a vote of thanks had been extended to the authors of the communications, C. L. S. Tingley of the Accountants' Association called attention to the educational campaign of that association, particularly in securing the services of Professor Wildman, New York University, to conduct a correspondence course for employees of electric railways on both the detailed and broader aspects of accounting.

He said that to make this course permanent and efficient it was very desirable to have as many companies as possible interested in it. While enough enrollments, slightly less than 400, had been obtained to insure the course, it was desirable that as many as possible should join. Mr. Tingley then distributed some explanatory literature. Following this the delegates from the Claims Association adjourned to their own session while the meeting was continued as a joint session of the Engineering and Transportation & Traffic Associations. This meeting is reported elsewhere in this issue.

JOINT SESSION OF ENGINEERING AND TRANSPORTATION & TRAFFIC ASSOCIATIONS

The joint session of the Engineering and Transportation & Traffic Associations was called to order by Acting President Brush of the latter association on Tuesday morning at 11 o'clock. The first order of business was the report of the joint committee on block signals for electric railways, J. M. Waldron, chairman.

In presenting the report of the committee on block signals Mr. Waldron stated that a sub-committee was to work with the one from the Railway Signals Association during the next year to select from among the standards designs of the Railway Signals Association such ideas as could be properly adopted as standard by the American Electric Railway Association. This would eliminate conflicting designs with a minimum of lost time.

The two standard designs proposed by the committee, namely, a spectacle casting and a standard clearance diagram for semaphore signals were then presented to the association for its consideration. The former was approved as standard but the latter was referred back to the committee so that co-operation with the power distribution committee could be effected and certain limiting dimensions regarding the height of trolley wire could be agreed upon.

Suggested rules for signals were then approved by the association as they appeared in the committee report, and new signal rules for operation under contactor signals were approved with certain recommendations, excepting that Rule 10 appearing in the report was withdrawn by the committee for further consideration after an extended discussion. This rule dealt with the procedure when a train failed to set the signal upon entering a block.

All of the rules as changed were then approved as standards of the Engineering Association, and after this the recommendation that lenses of not less than 8⅜-in. diameter for high speed and 5⅜-in. diameter for moderate speed should be adopted as good present practice. The report as a whole was then approved and a vote of thanks was extended to the committee.

Mr. Stewart, Mahoning & Shenango Valley Railway, then read the report of the committee on transportation engineering, as abstracted elsewhere in this issue. This report was approved and the thanks of the association were extended to the committee. The meeting then adjourned.

ADDRESS OF PRESIDENT GLOVER OF THE ACCOUNTANT'S ASSOCIATION

President Glover, in opening his address yesterday before the Accountants' Association, mentioned at first the marvelous development of the electric railway industry since the association was organized on March 23, 1897. He called attention to the fact that the *Street Railway Review* was instrumental in calling the meeting of the association, and that for the last eighteen years the electric railway press had given to the association support and encouragement that was worthy of acknowledgment and appreciation.

The first suggestion made by Mr. Glover was that a rearrangement should be made of the committees so as to provide for certain standing committees and the forming of special committees from time to time as needed. He recommended that in order to secure continuity of work some members of each standing committee be held over from year to year, but that the other members be changed to bring new life and new ideas into the committee work. This suggestion, however, did not refer to the classification committee, which, in Mr. Glover's opinion, should not suffer a change in membership from year to year.

Mr. Glover said that although the Accountants' Association had adopted a uniform system of accounts, less than one-third of the electric railways in the United States used this classification as it stood. The reasons for this were that a number of state commissions prescribed different classifications, and although the association classification agreed with the Interstate Commerce Commission classification, many companies did not report to this commission and therefore were not required to use its classification. Moreover, in some cases companies were not required by law to follow any special classification. Mr. Glover believed that a uniform system of accounts should be adopted by all state commissions and companies, and he hoped that the meeting of W. F. Ham, H. J. Davies and C. L. S. Tingley with the National Association of Railway Commissioners on Nov. 17, 1914, would accomplish much good along this line.

Mr. Glover mentioned the co-operation and sympathy that had been shown between the Central Electric Railway Accountants' and the American Electric Railway Accountants' Associations during the last year on the subject of the tentative uniform system. He then took up three subjects to which he thought the association should devote attention: overhead charges, segregation of freight and passenger expenses and cost accounting. In connection with the first topic, he advised the delegates to read the address of Judge Cooley before the 1911 convention. To Mr. Glover's mind the division of expenses between freight and passenger business was of vital importance in all questions relating to rate increases, and as electric railways must secure higher prices for service or give poorer service, some plan should be devised to obtain such information. In view of the regulations recently prescribed by the Interstate Commerce Commission for a system of cost accounting to be kept showing in detail the cost of all improvements, extensions and changes of physical property, he deemed it desirable for the association to adopt a uniform cost system for maintenance expenses as well as for road and equipment expenditures. Unfortunately certain engineers were apparently unwilling to cooperate with the accounting department on this subject, but Mr. Glover stated emphatically that statements concerning the lack of value of accounting department cost data should not go unchallenged. In his opinion the best results could be obtained only through the co-operation of the two departments, and no interested department should have the right to prepare a cost statement without having it verified by the accounting department.

Mr. Glover recommended that electric railway accountants take the correspondence course arranged for by the committee on education. He also said that accountants should realize the importance of co-operation in adopting a uniform system not only of accounts but also of statistics and of methods of doing business. Such reforms as the securing of uniform monthly and annual reports would have to be and should be brought about by the accountants, but the co-operation of the three other associations should be secured.

In closing his remarks, Mr. Glover deplored instances of unjust public utility regulation, and in expressing optimism for the electric railway future quoted President Wilson's recent remarks regarding the economic indispensability of American railway systems. Mr. Glover was pleased to report that instead of the usual deficit there remained $456.75 out of the appropriation of $2,141.68 for the current year, exclusive of $136.10 properly chargeable to the previous year's expenses.

As a part of its shop equipment the Shanghai (China) Electric Construction Company, which operates an electric railway there, has installed a complete oxy-acetylene welding and cutting outfit. The company finds considerable economy in generating its own acetylene. The whole of this plant is mounted on a flat trolley which can be transferred to any part of the system. Electric arc welding is also carried out by a small plant designed by the shop staff.

TUESDAY MORNING'S SESSION OF THE TRANSPORTATION & TRAFFIC ASSOCIATION

The Tuesday morning's session of the Transportation & Traffic Association was called to order by Acting President Brush at 9:15 o'clock. The first order of business was the reading of the following communication on flagging which L. H. Palmer, chairman of the committee on rules, had received from Frank Kingsley, associate editor Electric Railway Journal:

In 1911 this association eliminated from the standard code old rule 203a that permitted trains to proceed under flag protection when they could not reach the despatcher. This rule was considered to be bad practice. However, it is a fact at present that at least a half-dozen interurban roads have reintroduced the old rule or its equivalent in their codes of signal rules. In a communication by John Leisenring printed in the Electric Railway Journal for Sept. 12, it is indicated that this has been done because conditions have changed since 1911 (owing to the wide introduction of signals) and because some such rule is necessary to avoid occasional serious interruptions to traffic by defective signals in stop position. In consequence the committee will, no doubt, agree that a definite expression of opinion should be given at once by the association to relieve the present contradictory situation.

Mr. Palmer said that the matter was a very important one, but agreed with the chair that it should be referred to the incoming committee on rules. Upon motion by Mr. Duffy the matter was disposed of by thus referring Mr. Kingsley's communication.

J. J. Dempsey, chairman, then presented the report of the committee on schedules and time-tables, an abstract of which appears elsewhere in this issue. Mr. Duffy commended the good work which this committee had done during the past five years and agreed with its recommendation that the work on schedules and time-tables should be continued in some form. He doubted whether the arbitrary stop method would be of great value in the smaller cities, although it had worked well in a fair-sized town like Rochester. As to setbacks, the schedule should be so arranged that their use should be dispensed with as far as possible.

R. E. Danforth, Newark, believed that the committee's work next year should include the problem of producing able schedule makers. There were few real schedule makers in the country, and it took much training as well as natural ability to do the work.

R. B. Stearns, Milwaukee, said that some discussions which his company had had recently with the public regulating authorities pointed out the advisability of using the term "designated stop" instead of "arbitrary stop." The use of such a word as "arbitrary" was distressing in the wrong conception that it conveyed. He also suggested that the incoming committee might well occupy its time with the construction of "base schedules," by which he meant the attempt to establish a schedule founded on the minimum service requirements to which, with the use of morning and evening gap schedules, cars could be taken from or added to the schedules at minimum expense. Seasonal changes of schedules should be sufficient and could be determined in advance.

Alexander Jackson, Public Service Railway, said the skip-stop idea had its advantages, but he thought that if the near-side stop could be standardized it would save two to three stops per mile on most properties. To save three stops per mile would save two or three minutes on a round trip which, on a two-minute headway, meant the elimination of one car and on a one and a half-minute headway the possible elimination of two cars.

Upon motion the report of the committees on schedules and time-tables was approved. The meeting was then adjourned in order to permit the joint session with the Engineering and Claims Associations which is reported elsewhere in this issue.

HOW ACCIDENTS MAY BE PREVENTED

F. C. Henderschott, manager bureau of education New York Edison Company, in his paper on the prevention of accidents before the Transportation & Traffic Association stated in substance as follows:

A casual examination of the subject of accidents in industry leads to the conclusion that conditions are indeed very serious. In the late civil war, according to figures from the adjutant general's office, the number of Union men killed in battle during the four years was 67,058. It is probable that the total number of Confederate soldiers actually killed in battle did not exceed much, if any, the losses of the Union forces, but the most conservative estimate places the total of persons killed by accident in the United States, at the present time, at not less than 75,000 in a single year.

The 1913 report of United States Commissioner of Labor, Hon. Charles P. Neill, upon the conditions of employment in the iron and steel industry states:

"On the one hand for a large group of plants in which the work of organized accident prevention is well developed, the rate falls as low as 167.1 per thousand 300-day workers, while at the other extreme for a group of plants in which organized safety work has not yet been developed, the rate rises to 507.9 per thousand, and in the case of individual plants in the group considerably higher." This is a reduction of 67.1 per cent, or of two accidents out of every three.

To quote Arthur Williams, president of the American Museum of Safety: "No measure of value can be applied to the suffering of individuals who are injured or to the anguish of those who have lost relatives through industrial accidents. There is not only this immediate economic loss, but that which accrues in the future to dependents who, as a result of accident, are left without the means of either sustenance or education. The grief and pain arising from deaths and permanent disabilities wrought from this country's industries, and from carelessness outside of industry—as, for example, upon our highways—far exceed any suffering or sacrifice of life that have occurred or ever could happen through war."

Again he says, in a recent discussion of the subject of industrial accidents: "Perhaps not sentimentally, but practically, human health and life have been held most cheap, not only in our country's industrial development, but in our social order as well. And until recently in industry the most ordinary physical and sanitary precautions have been lacking; in social life we have permitted the development of slums—breeding spots of unhappiness disease and crime; in our entire industrial system we have neglected to the utmost degree essential elementary protection of health and life."

That Mr. Williams has not overdrawn the picture is proved when we turn to some recent reports by corporations of accomplishments they have made, along the line of accident reduction, during the past year.

The bureau of efficiency of the Northern Pacific Railway, while but a little more than a year old, was able to reduce deaths due to operating accidents on that railway system during the first six months of 1914 as compared with a similar period of 1913 by 73 per cent. The Carnegie Steel Company has been able to reduce its accidents about 71 per cent. Reports from many other industrial corporations lead to the conclusion that it is possible to reduce accidents, where no effort has yet been made in this direction, anywhere from 80 per cent down to 20 per cent, according to the character of the business.

But, as J. L. Murrie, safety engineer, and J. C. Robinson, chief of the bureau of adjustment of The New York Edison Company, have pointed out in a recent paper on "Safety in the Electric Light Industry": "No device ever has been invented and none ever will be invented that will operate with unvarying success, under all conditions in saving life or limb. The human equation enters too strongly into the proposition and must not be ignored or eliminated. Intelligent co-operation by the employee is a vital essential, and such co-operation is the gospel we must preach. We may reach the extreme limit of ingenuity in the making of a machine that protects a man against danger, but if no mental impulse be exerted the danger is not averted. We can demonstrate the peril of the live wire and the protective value of the rubber glove, but without co-operation between the human mental and the physical material, the warning as to the one and the advice as to the other are alike useless."

In the New York Edison Company 85 per cent of accidents are due to employees, carelessness or negligence, 6 per cent due to carelessness of fellow-servants, 2 per cent due to outside contractors and 7 per cent are chargeable to the company.

The Au Sable Electric Company of Michigan, in a recent report, states that 75 per cent of the accidents in that company are due to carelessness, and Mr. Williams in a recent summary, based, no doubt, upon data gathered by the American Museum of Safety, states that: "Between 70 per cent and 90 per cent of all accidents are the result not of physical defects in our urban industries relating, say, to manufacture, transportation and kindred subjects, but to carelessness and oversight on the part of persons injured, their fellow-workers, or those in control of the means of injury."

The subject of accident prevention was first approached largely from the standpoint of safeguarding machinery. For some time industry devoted its efforts toward accident prevention largely along this line. But the Westinghouse Electric & Manufacturing Company, in a report for 1913, showed that less than 0.5 per cent of the accidents occurring in its plant was due to lack of safeguarding. In this report, Dr. Lauffer attributed a goodly proportion of the accidents directly to the influence of the saloon and predicts that the present generation will wipe out the saloon.

It is not my purpose to discuss prohibition, but surely no analysis of the causes of industrial accidents, deaths and disease would be complete without reference to the evil influence of the intemperate use of liquor. And industry has not been slow in recent years to recognize this fact. Many of the large railroad companies prohibit the sale of liquor upon their trains, and any employee seen in an intoxicated condition is immediately discharged. It is perhaps due, at least in some degree, to the fact that transportation companies have taken this stand, that some of the larger transportation systems have not killed a single passenger in the past five years. But while this condition is gratifying, we are disheartened when we learn that 25,000 children under eighteen years of age have been killed upon railroad tracks during the past twenty years. It is not the fault of the transportation companies that children are upon their tracks, and this leads to the inevitable conclusion that accidents and deaths cannot be reduced to the minimum until there is co-operation upon the part of the public, upon the part of the press, the pulpit, educational institutions and all along the line.

Physical examination of employees is already playing an important part in the reduction of industrial accidents. Dr. Lauffer, in the report, says: "In our opinion the good health campaign is more result-producing in the line of accident prevention than much additional safeguarding of machines."

In a paper on "safety first," presented before the last convention of the National Electric Light Association, Paul Lupke pointed out two important facts. "Newspaper men and other publishers and writers know that the people do not learn facts and arguments on any subject by one announcement, and that it needs constant effort of iteration and reiteration to send the matter home to the people it is wished to reach." And the second point: "The greatest factor operating toward the prevention of accidents is not the prevention device but the 'prevention spirit'."

Several years ago a commission appointed by the federal government visited the big manufacturing industries of Germany, and it was shown by a tabulation of 80,000 cases investigated by them that 80 per cent to 84 per cent of the total number of accidents were chargeable to the employees. This would seem to indicate that about the same degree of negligence on the part of the employees exists the world over; that it is one of the chief characteristics of human nature to be careless.

It is obvious in a paper to consume but twenty minutes very little detail can be given. However, the picture is not so dark as it might appear at first glance. In excess of 1000 industrial institutions have instituted accident prevention systems in the industries of the United States, and while the annual toll paid by this country on account of industrial accident amounts, at the present time, to in excess of $250,000,000 exclusive of loss of time and efficiency of those injured, a good beginning has been made in the direction of improvement.

Recognition has been accorded to the safety engineer and to his collaborator, the efficiency engineer. Industrial corporations are beginning to add the third, and perhaps the most important factor in the entire movement, the educational engineer. More than eighty industrial institutions, including among the number several of the larger railway systems, the larger manufacturing companies, financial, insurance, publishing and retailing institutions have established educational courses on behalf of their employees, and in connection with the better training systems compulsory physical examination is being urged, and due recognition is being given to fatigue, intemperance, worry and the other contributory causes to accidents, diseases and death.

A campaign designed to prevent accidents must be based upon the natural tendency of the human being to be careless. To be effective, the work must be carried on with enthusiasm but not spasmodically.

Since instruction on the subject of safety, by lectures, was introduced into the schools of New Jersey, accidents to school children for the six months ending Sept. 1, 1912, were 44 per cent less than they were during the same period in the previous year.

Once instituted, the safety department of a corporation should be considered a permanent feature and the effort should not be allowed to lapse. This association can render no more valuable service to its members and to the public than by placing its prestige squarely behind its safety board and to co-operate with similar committees from other organizations to the end that industrial accidents, industrial disease and untimely deaths shall be reduced to the lowest possible number throughout the industries of the United States.

HOWLING FROM THE HOUSE-TOP

Electric Railway Service, published in the interest of the Detroit United Railway for general distribution, recently contained the following item which will be of interest to electric railway men generally:

"W. H. Woodbury, whoever he is, writes the Detroit *Journal* calling the attention of people to the fall styles of ladies' hosiery as revealed during the entrance to and exit from Detroit street cars. If such inspection constitutes Mr. Woodbury's form of entertainment he should not endeavor to divert the attention of others from their work."

PRESIDENT BLACK'S ADDRESS TO THE AMERICAN ASSOCIATION

The past year has been a strenuous one for the majority of our members. Our industry is passing through a most crucial and critical period, not so much by reason of any changes in the art of transportation as because of the attitude of the general public towards all public utilities, as well as from the problems arising through the evolution of governmental regulation. And now we have added to the above the serious economic conditions resulting from the European war. But I cannot help feeling greatly impressed with the vigor and enthusiasm of the men engaged in the electric railway industry; they have met and overcome the difficulties of the past and will unquestionably be able successfully to cope with those of the future.

During the past twenty-five years we have witnessed an industrial development unparalleled in the world's history, and no factor in this development has played a more important part than the electric railway. Cities have been enabled to expand their boundaries far beyond what was deemed possible before the advent of the trolley car, thus eliminating to a great extent the congestion so common to the cities of the old world, and making it possible for workers to find comfortable homes at reasonable cost in the suburbs. For every dollar of profit realized from electric railways, the community at large has gained at least one hundred dollars in taxable values, while the individual owners of suburban real estate have enjoyed increases in the so-called unearned increment aggregating enormous sums.

These results have been brought about largely through the establishment in this country of a flat 5-cent fare, or less, enabling a passenger to travel from any one point in a city to any other regardless of the distance, and, in fact, oftentimes to points far beyond the corporate limits. Owing to the undeveloped system of accounting generally in use by electric railways, and the more than vague ideas of the actual cost of the service, the fact that this long-haul travel was carried on at a considerable loss was far from realized until a comparatively recent period. The more the public received the more it demanded, and at the same time there commenced to be a marked decrease in the value of the token or fare received.

Finally, in 1910, the association appointed a committee to report on the proper basis of rates and fares, which committee was succeeded in 1912 by the committee on cost of transportation. This committee reported to the 1913 convention, recommending the establishment of a bureau of fare research, which culminated in the appointment, on May 1 of this year, of F. W. Doolittle as director of the bureau to work under the direction of the committee on cost of transportation. Mr. Doolittle, from his education and past experience, is peculiarly fitted for the work he has undertaken. An idea of the scope of this work and of its importance and value can be gained by reference to the June, 1914, *Aera.*

THE COMMITTEE ON PUBLIC RELATIONS

When you bestowed upon me at our last convention the honor of the presidency of the association, it devolved upon me not only to direct through its committees and officers what might be styled the routine work, but also, if possible, to enlarge the value of the association to its members.

It appeared to me that no more fertile field presented itself than that occupied by the committee on public relations. This was a regular committee of the association, and had been in existence for a number of years, but its work had been more ornamental than useful.

In the past the association has never experienced any difficulty in finding men for the various committees who were fully capable of dealing with the problems which have arisen from time to time. But the question of public relations is very different from the subjects generally considered by these committees, and the ideas of even those men who had given the matter the most careful and thorough study were vague and indefinite. Everyone recognized the fact that our public relations were in a most unsatisfactory condition and that the improvement of this condition was of vital importance to the industry. But how to tackle the problem was another question. It seemed to me, therefore, important that we should call upon the very best talent at our command, and a committee was appointed, including not only representatives of the electric railways proper but also men from the manufacturing, banking and engineering interests who are identified with our industry. Thomas N. McCarter, president of the Public Service Corporation of New Jersey, was appointed chairman.

Several meetings have been held during the past year and, on the evening of Jan. 29 Mr. McCarter gave a dinner to the members of his committee and also had as his guests several members of the public policy committee of the National Electric Light Association and other gentlemen identified with public utilities.

The results of the discussion which followed the dinner, and of the several meetings of the committee which have been held, are crystallized in the code of principles embodied in the report of the committee to the association, and which it is confidently expected all members of the association will heartily indorse.

The report also recommends the establishment by the association of a bureau of public relations and outlines a comprehensive plan for a publicity and educational campaign which, I trust, will receive most careful thought and study.

While it may not be practicable, under the existing financial stress, for the association to raise any large sum of money to carry out the broader plan outlined, the member companies can and should start the ball rolling in their own localities. The association can point the way and make suggestions and furnish ammunition, but all of these will be in vain, unless the member companies themselves take hold of their own local problems. Electric railways have one peculiar advantage over all other public utilities in the fact that their employees, the motormen and conductors, come into close and intimate daily contact with the public. Here is a tool ready at hand to commence the work which every electric railway should make use of. But, first, it is absolutely essential to establish cordial and harmonious relations between the companies and their employees.

By the establishment of company sections, two important objects will be attained: first, the employees of the company can and will be brought into closer and more intimate contact with the general officers and will obtain a much more comprehensive understanding of their duties, which will result in greater loyalty to the company and better service to the public; second, the individual membership of the association will be materially increased, thus adding strength through members to the organization, as well as increasing its financial resources.

PROPOSED INCREASE IN DUES

In connection with this last matter, I desire particularly to call your attention to the report and recommendations of the executive committee contained in the circular letter dated Sept. 10, 1914, which was sent to all of the company members, and the approval of which I strongly urge. As the work of the association broadens, its usefulness to its members increases. We now have 400 electric railways enrolled, representing approximately 90 per cent of the capital invested in the business, and we cannot hope for any material increase in dues from new company members. The revised schedule of dues will provide about $16,000 of additional revenue, which will enable the association to meet the added expenses incurred in connection with the establishment of the fare research bureau, as well as the other increased activities mentioned in the letter.

FEDERAL RELATIONS

The past year has been an active one for our committee on federal relations. Matters of great importance to our industry have been pending in Congress and numerous hearings have been held before congressional committees. Under the able chairmanship of one of our ex-presidents, Arthur W. Brady, this committee succeeded in securing the exemption of electric lines from the requirements of the steel car, and other bills relating to physical and operating conditions, some of which were most drastic in character.

As a result of the hearing before the Senate committee on interstate commerce, the railway securities bill, which had been passed by the House of Representatives in such form as to include electric railways engaged in interstate commerce, was reported with an amendment eliminating all electric lines except those forming part of a railway system operated in part by steam. This bill is still pending, but apparently is not being pressed for passage at the present session of Congress.

You are all no doubt more or less familiar with the bill introduced by Congressman Crosser of Ohio, providing for the public ownership of all street railways in the District of Columbia. The passage of this bill would unquestionably give a great impetus to the municipal ownership agitation. While the bill has been favorably reported by the committee having it in charge, by a majority of one, no further action has been taken. This result was unquestionably due to the able arguments presented at the hearings before the committee by General Harries, Thomas N. McCarter, William J. Clark and others, to whom the thanks of of the association are due.

It is appropriate at this point to refer to the efficient work of our Washington representative, the firm of Clark, Prentiss & Clark, and particularly to Horace F. Clark, who rendered especially valuable assistance to the committee on federal relations at the Congressional hearings.

OTHER COMMITTEE ACTIVITIES

No report which will be made to the convention embodies more painstaking time and labor than that of the committee on joint use of poles. Consisting of representatives of this association, the American Institute of Electrical Engineers, the National Electric Light Association, and with a representative of the American Telephone & Telegraph Company conferring, this committee has revised the report submitted to the convention last year and has prepared a form of agreement and specification which, it is believed, the member companies will find most valuable in any negotiations they may enter into covering this subject.

The committee on education has also shown most commendable activity. Several courses in electric railway engineering have been arranged for at moderate cost with one of the well-known correspondence schools and a serious effort made to induce college and university faculties to have representatives attend meetings of the association, so that they may better understand the requirements in the education of a young man who desires to enter the electric railway field.

In 1913, our association received an invitation from the American Institute of Electrical Engineers to participate in the organization of a national committee to consider the question of electrolysis. This invitation was accepted and, during the past year, a joint committee was formed with representatives from the following organizations: American Electric Railway Association, American Electric Railway Engineering Association, National Electric Light Association, American Telephone & Telegraph Company, American Institute of Electrical Engineers, National Bureau of Standards, National Gas Association and American Gas Institute. Several meetings of the committee have been held and the work is well organized and now under way.

This matter is one of great importance; the questions involved are not only highly technical from an engineering standpoint, but also involve serious economic considerations, and the association is to be congratulated upon having such able men as R. P. Stevens, A. S. Richey and Calvert Townley as its representatives on the committee.

The results of the work of the other committees of the association are fully set forth in the reports they will submit, all of which are most interesting and unquestionably will prove of great value to the member companies.

THE AFFILIATED ASSOCIATIONS

But while the work of the parent association has been of a very important character during the past year, that of the affiliated associations has hardly been less so. In the Engineering Association, the issuance of the Engineering Manual was an epoch-marking event. This valuable work contains all the standards and recommendations which have been adopted by the association and a quantity of other important information, presenting in concise form the best thought in electric railway engineering practice.

In the promulgation this year of the revised classification of accounts by the Interstate Commerce Commission, the Accountants' Association can congratulate itself upon the culmination in a most satisfactory manner of three years of hard work by one of its most important committees.

Through its education committee this association has arranged for a course in electric railway accounting under Prof. John R. Wildman, of New York University, and has already secured in the neighborhood of 400 enrollments.

The "safety first" movement, which has become a slogan from the Atlantic to the Pacific, will be one of the principal subjects for the Claims Association when the report of the board of accident prevention, which will be presented at a joint session of the Claims, Engineering and Transportation & Traffic Associations, is discussed.

Before the Transportation & Traffic Association many matters of current interest and importance are coming up, such as studies of motor-bus operation and its relation to electric railways, fare boxes and their maintenance costs, etc. This association, during the past year, has had the misfortune to be called upon to accept the resignation of its president, D. A. Hegarty, which was necessitated under the constitution by reason of the severance of his connection with a member company.

MID-YEAR MEETING

Thanks to the efforts of our committee on subjects, under the very efficient management of James D. Mortimer, our members who attended the wid-winter conference held in New York last January enjoyed papers of exceptional value and interest. In the past it had been customary for the Manufacturers' Association to tender a banquet to the parent association at this mid-winter meeting, but the parent association, feeling some embarrassment in accepting this courtesy year after year, decided at our last convention that, in future, this banquet shall be given jointly by the American Association and the Manufacturers' Association. This plan was carried out last January with satisfactory results to both associations. Over 700 of our members and guests attended the dinner and enjoyed the able papers presented by the Hon. Halford Erickson, of the Public Service Commission of Wisconsin, Henry W. Anderson, vice-president and general counsel of the Virginia Railway & Power Company, and Guy E. Tripp, chairman of the board of directors Westinghouse Electric & Manufacturing Company.

AERA

Aera, which has just completed its second year, has admirably fulfilled the purpose for which it was established. The objects of the magazine are threefold; first, to act as a medium of communication between the association and its members; second, to educate electric railway officers and employees in the problems affecting the industry; and third, to present to the public the aspects of these problems from the electric railway standpoint. The increasing interest which the members are taking in the magazine may, I think, be best illustrated by the constantly increasing number of contributors. Altogether, during the past year, more than 360 railway men, interested in the association, prepared material for *Area* and expressions of commendation have been received from many sources. Through the means of clipping sheets sent to more than 1200 daily newspapers throughout the United States, much of the pertinent matter which *Area* contains has been laid before the general public. To the members of the association who have given freely of their time and thought in the preparation of articles, credit for the success which has attended the magazine must be given.

Commencing the first of last January advertising was resumed and while, up to the present time, a sufficient amount is not realized from the sale of this advertising to make *Aera* self-supporting, the revenue from this source is steadily increasing, and it is confidently expected that, in the comparatively near future, the magazine will be absolutely on a self-supporting basis. On behalf of the association I wish to extend thanks to those manufacturers who, through their support of the advertising columns in *Aera*, have lent such material aid to one of the association's important activities. I also, on behalf of the association, desire to extend thanks to the Manufacturers' Association for its hearty co-operation, both financially and morally, in the association's work. The committees of the Manufacturers' Association have worked in perfect harmony with the committees of the parent association in connection with all preparations for our present convention, and the success not only of this convention, but of those held in the past has been due to the able management of that association.

Indebtedness to the Technical Press

We are also greatly indebted to the technical press of the country for the co-operation and support which has been so generously extended to the association in all its activities, and it is a great pleasure to express our hearty appreciation for this assistance.

The 1915 Convention

At our mid-winter conference, after considerable discussion, it was finally decided to hold our 1915 convention in San Francisco. Unquestionably, a large number of our members will wish to visit the Pacific Coast during the coming year to see the Panama-Pacific International Exposition which is to be held in San Francisco commencing Feb. 20 next, and, consequently, if we are ever to hold a convention in the Far West, this is the opportune time to do so. In view of the great number of conventions planned to be held in San Francisco, as well as the large number of people who will unquestionably visit the fair, it will be absolutely necessary to make definite plans for our convention at an early date, in order to insure comfortable hotel accommodations for our members and suitable halls for holding our meetings. It will also be necessary for member companies to advise our secretary promptly as to the probable number of delegates which each company will send. This will be the first convention ever held by the association west of the Rocky Mountains and it is due the member companies from that section of the country that the association make every effort to secure a full attendance from the East.

Problems Before the Electric Railway Industry

At every convention and at every meeting of our association its value to the electric railway industry becomes more and more apparent. The field for its activities broadens and its usefulness increases. At our coming convention several papers will be read dealing with the question of valuations and the rate of return.

Since 1910 there has been a marked falling off in new construction and a reluctance on the part of investors generally to place their money in electric railway securities. In a large measure this has been brought about, no doubt, through governmental regulation. Capital is inherently shy, and always ceases to flow readily when any radical changes occur. In other industries, such as banking, manufacturing, mining, etc., a rate of return ranging from 10 per cent to 20 per cent, or even more, is not considered either remarkable or unreasonable, while in the case of public utilities the state commissions generally have limited the rate of return to a maximum of 8 per cent, and this oftentimes on a depreciated valuation. The reasons given for this comparatively small allowance are based upon the assumption that the business of a public utility is more stable and less subject to competition than other industries.

While it is true that, under the laws in many states at the present time, public utilities are not as subject to competition as other industries, they are not entirely free from it, and it is not true that they are not fully as subject to many other contingencies which may radically affect their income. A striking example is found in the inauguration of motor-bus service in a number of cities and, whether or not these prove successful in the long run, they certainly for the time being materially affect the income of the street railways. Furthermore, all our public utilities, with possibly the exception of water supply, are subject to radical changes in the art, making it necessary oftentimes to discard or scrap large parts of the investment long before it is worn out. Provision for this obsolescence cannot possibly be made without setting up reserves far in excess of what would be permitted by any of the commissions.

Capital naturally will seek those investments in which the rate of return is the highest, due consideration being given to the security of the investment. Unless this fact is recognized by the state commissions and a rate of return allowed commensurate with the risks involved and with the returns which can reasonably be expected from other lines of industry, it will be absolutely impossible to secure fresh capital either for extending present plants or for exploiting new ones.

The European war has, of course, very largely increased the difficulties of securing fresh capital, as is vividly illustrated by the fact that the city of New York recently was obliged to pay 6 per cent for money obtained on notes exempt from many forms of taxation and to run for from one to three years.

We are still a debtor nation. If there was any doubt upon this subject, it surely has been dispelled by the recent course of exchange on London. The money centers of Europe have in the past absorbed vast quantities of our public service securities, but these markets have now been absolutely cut off, and it is hardly probable that they will again be available for a long time to come. This means that we must depend upon American capital for future development, but it will take more than the possibility of an 8 per cent return to secure this capital, especially under the conditions of junior financing, which must be resorted to in many instances. Our task is to convince the public and the commissions that these are facts, not theories, and that, until they are recognized, no further development is possible.

In closing, I personally desire to express to the association my appreciation of the high honor bestowed upon me at our last convention, and my only regret is that I was not so situated as to be able to devote more time to the association's work. I also wish to thank the other officials and various committees for their hearty co-operation and assistance, as whatever success has attended my administration is very largely due to their work.

THE EDUCATION OF TO-DAY

In the address on modern education, delivered yesterday before the Accountants' Association, John R. Wildman, professor of accounting New York University, drew some analogies between primitive and modern conditions and methods of education in making clear the significance of certain phases of the educational situation as it exists to-day. Primitive education is supposed to have been almost without conscious aim and not to have possessed any genuine ideals, either political, social or moral. In the case of modern education, developed under an ever-increasing complexity of civilization, ideals do exist, but opinions differ greatly as to what is the central aim. Proponents are found for moral character, culture and mental development. Professor Wildman is not opposed to the attainment of these personal attributes, but he takes exception to the worship of these ends as such and to some of the means whereby they are attained.

In Professor Wildman's opinion the ideal education is that which enables one to adapt himself harmoniously to his environments and to utilize natural forces to serve him and his fellows in their needs. Young men should be taught how to get enough money to enable them to provide the necessities, both physical and intellectual. The modern educational system should educate primarily for business but in a way conducive to a strong mind and a fine moral character. The primitive educational method of imitation has been largely abandoned. Modern business education necessitates determining exactly what young men should know and then teaching them this in accordance with the latest and most improved methods for actually conducting business.

Business education, however, is not confined to a study of simply one profession, for every true business man must know certain fundamentals of commerce, accounts and finance. The accountant must naturally study the theory and practice of accounting, but not without regard to the relations which accounting bears to economics, law, finance and business organization. Professor Wildman believes that accountants who have been thus trained perform their work with a clear consciousness of what they are doing instead of serving in a merely routine and perfunctory manner. Moreover, such an education cannot be said to be devoid of rewards, for the knowledge of the subject and the rendering of maximum service to the employer result not only in financial but also in intellectual and moral betterment.

REPORT OF COMMITTEE ON EDUCATION

The work of the committee on education of the American Association has comprised two parts: (1) a study of existing practice in regard to apprentice training by member companies, and (2) preliminary arrangements for courses of instruction to be given by a correspondence school under the general auspices of the association. The committee found that very few companies have regular apprentice systems for training mechanics and that those which have apprentice systems do not, in general, have regular courses of training. There is apparently no instruction of a school nature given in the electric railway industry, nor is there any extensive co-operation with trade, vocational or night schools. There was a general interest manifested by the membership in the proposed correspondence courses and there is a good prospect of a reasonable enrollment as soon as the courses are put into operation. The committee presented a statement of the tuition fees for four courses: (a) mechanical shop course, (b) electrical shop course, (c) line and track-work course, and (d) power house and substation course. With the exception of the last-named, the fee for which is $37, the tuition fee is $30 for each course. Combinations of two courses can be taken at reduced rates. The committee proposes to follow closely the work of the students.

REPORT OF THE JOINT COMMITTEE ON TRANSPORTATION ENGINEERING

The joint committee on transportation engineering (Engineering and Transportation & Traffic Associations) reported yesterday on train operation in passenger service, train operation in freight and express service, and effect of car and equipment design on duration of stops. The report on train operation in passenger service does not amplify the arguments of last year's committee, but does present figures to show that on a 6600-volt single-phase line in the Middle West, the use of trains on a holiday permitted an increase of 158 per cent in seating capacity and of 122 per cent in ton-miles at an increase of only 76 per cent in energy consumption.

As to freight and express service, the committee found that with the increased length of trains and runs for the permissible lower schedule speeds the tendency is to use a single-motor car or electric locomotive with trailers instead of multiple-unit equipment. Train operation saved platform expense and energy while it was safer than single cars. In studying the effect of interurban car and equipment design on the duration of stops, the committee made eight plans of passenger, and six plans of freight cars. It found that the double-end two or three-compartment car was generally conceded to be the most flexible design, and it believed that end doors should be incorporated in all cars to meet possible train operation even if the end doors were not available to passengers on the short curves of city sections. Excessively large rear platforms were a mistake, and far less essential than easy steps. All bulkhead doors, except those at the baggage compartment, should swing instead of slide in order to permit stronger bulkheads and less cost for door maintenance. As to freight and express car design, the committee favored two large doors on either side, particularly where less-than-carload shipments are to be handled. In conclusion, the committee said that if electric railways are to take advantage of train operation economies they must be prepared to adapt their terminal facilities for longer trains.

REPORT OF COMMITTEE ON EXPRESS AND FREIGHT-ACCOUNTING

The committee on express and freight accounting in its first report presented yesterday before the Accountants' Association outlined in detail what are considered the best methods for keeping freight accounts in both agents' and auditors' offices. The system proposed covers in brief the entire field, not only for those companies who are already conducting an interline freight business but also for those who will eventually have such a source of revenue and those who now do only a local business but will in the future exchange shipments with other companies. The committee suggests thirty-one forms that are needed and explains in detail the accounting procedure that is to be applied from the time freight is accepted from shippers until all entries, reports and summaries are completed. The committee considers that the settling of balances due other roads for traffic accounts by allowing them to draw for such is the simplest method and involves the least work.

REPORT OF COMMITTEE ON STANDARD CLASSIFICATION OF ACCOUNTS

The eighteenth annual report of the committee on the standard classification of accounts presented yesterday before the Accountants' Association constitutes in general a résumé of the committee's activities from the inception of the Accountants' Association in 1897 up to the present date. Its influence in bringing about a standard classification of accounts and the development of this to suit the growth of the industry are briefly described. During the past two years, in co-operation with representatives of the Interstate Commerce Commission, the committee has been considering new classifications covering operating, revenue and road and equipment accounts, as well as schedules and text for income, profit and loss, and general balance sheet accounts. The committee held two protracted sessions last year with representatives of the commission and worked out the uniform system of accounts prescribed by the commission as effective July 1, 1914. This system, which has already been adopted by interstate electric railways and in many cases by state commissions, is recommended for adoption by the Accountants' Association. The report of the committee concludes with a list of all its past and present members with their respective periods of service.

COMMITTEE ON BLOCK SIGNALS

The joint committee on block signals of the Engineering and the Transportation & Traffic Associations presented in its report a digest of laws or rulings issued by the various states relative to block signals, a bibliography on signaling, and a summary of installations of block signals made during the year preceding July 1, 1914. A design for a semaphore spectacle casting was submitted for approval by the Engineering Association as standard, as was also a clearance diagram for semaphore signals. A set of rules for operation under trolley contact signals was included, and certain definitions now appearing in the standard block signal rules were revised to make them applicable to the requirements of trolley contact signals. The subject of light signals was discussed at length, and recommendations were made to the effect that, for light signals in high-speed interurban service, a lens of not less than 8⅜-in. diameter should be used and that in moderate-speed service a lens of not less than 5⅜-in. diameter should be used. In an appendix detailed descriptions of two types of automatic train stops were given.

The summary of replies to questions in the data sheet sent out each year by this committee included information as to the contemplated mileage of track to be protected by signals during the coming year and data upon the cost of signal maintenance and the efficiency of signal operation. Condensed data regarding the block signal installations made during the last year were also included. In another appendix the committee presented a study upon braking distance for trains at varying speeds, including a diagram with which any given problem of this nature could be solved by graphical means. Another appendix furnished brief descriptions of installations made by the various signal manufacturers during the last year.

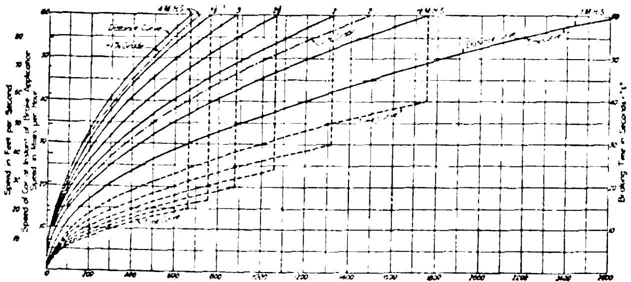

DIAGRAM FOR DETERMINING BRAKING DISTANCES AT VARIOUS SPEEDS

The above-mentioned diagram for determining braking distances at various speeds is shown in the accompanying illustration. To show how the chart is to be used assume that such a braking force has been applied to a car so as to produce a retardation of 3 m.p.h.p.s. It is desired to know how long a time will be required for the car to come to a stop and in what distance it will do so from a speed of say, 50 m.p.h. The solid line for 3 m.p.h.p.s. shows that a speed of 50 m.p.h. corresponds to a braking distance of 600 ft. Directly below this is a point where a vertical line intersects the distance-time curve for 3 m.p.h.p.s. and, reading on the right-hand scale, it is found that the time required for the stop is 16.5 seconds. A similar procedure shows that from 60 m.p.h. the same braking rate will stop the car in twenty seconds and 800 ft. The braking forces necessary to produce the various rates of deceleration are as follows:

Rotation	Braking force
1 m. p. h. p. s	91 lb. per ton
1½ m. p. h. p. s	137 lb. per ton
2 m. p. h. p. s	182 lb. per ton
2½ m. p. h. p. s	227 lb. per ton
3 m. p. h. p. s	273 lb. per ton
3½ m. p. h. p. s	318 lb. per ton
4 m. p. h. p. s	364 lb. per ton

The forces given above are those which must be applied tangentially at the car-wheel tread, the pressure from the brakeshoe being from four to eight times as great, depending on the coefficient of friction between the brakeshoe and the tire. As the forces are calculated for level track they must be increased 20 lb. per ton for each 1 per cent of upgrade and correspondingly reduced for each 1 per cent of downgrade. Referring to the chart the two dot-and-dash lines show the times and distances resulting from the application of forces on a 1 per cent downgrade which on the level would produce 4 m.p.h.p.s. and 2 m.p.h.p.s. retardation respectively. They are shown merely to give a practical concept of the effect of a familiar grade.

REPORT OF THE JOINT COMMITTEE ON THE JOINT USE OF POLES

The special committee on the joint use of poles, comprising representation from the American Institute of Electrical Engineers, the National Electric Light Association, the American Telephone & Telegraph Company and the American Electric Railway Association, presented its final report yesterday. It was the unanimous recommendation of the committee except that the telephone companies do not agree to enter into joint use of poles in any case where the voltage exceeds:

(a) 5000 volts constant potential, neither side grounded.

(b) 5000 volts constant current series alternating metallic (except when current does not exceed 7.5 amp, in which case the voltage may be not more than 10,000 volts).

(c) 7500 volts constant direct current series metallic.

(d) 700 volts constant potential, direct current, one side grounded.

The report comprises a form of agreement covering the joint use of wood poles on a rental basis and a set of recommended specifications for the joint use of wood poles. These take up in detail the placing of attachments and wires for various classes of circuits, including railway span wires and brackets. Included with the report are a number of dimensioned diagrams illustrating the principal specifications.

REPORT OF COMMITTEE ON COMPANY SECTIONS AND INDIVIDUAL MEMBERSHIP

The American Association committee on company sections and individual membership reported yesterday to the effect that two company sections had been organized during the year; the Washington Railway & Electric Company section, No. 4, and the Manila Electric Railway & Light Company section, No. 5. Several companies have taken steps in the direction of organizing sections. Sub-Chairman Martin Schreiber's midwinter convention paper entitled "A Plea for Company Sections" was a part of the year's campaign. (See Electric Railway Journal, Jan. 31, 1914, page 250.) An active and successful campaign for individual members has also been conducted continuously throughout the year.

The public utilities commission was discussing carload lots and less than carload lots, abbreviated to c. l. and l. c. l. Finally one of the commission (so the story runs) inquired: "Where is this C. L. and L. C. L. railroad?"

REPORT OF COMMITTEE ON COMPANY MEMBERSHIP

The American Association committee on company membership which met yesterday reported that an active canvass of possible members had been made throughout the year and that more than 400 members are now enrolled. These represent more than 80 per cent of the capital invested in the business. The remainder are principally small companies, and the committee reported the opinion that many of these will soon be enrolled. The committee has used a pamphlet, "Applying the Test," and the association year book in correspondence with prospective members.

REPORT OF THE COMMITTEE ON ACCOUNTING DEFINITIONS

The Accountants' Association committee on accounting definitions which reported yesterday was formed to present for consideration definitions that should promote a standardized use of various terms employed in accounting discussion and literature. The suggestion that such terms be defined arises from the confusing, sometimes misleading, use of words required in accounting. When the committee was asked to give attention to this subject it was with the understanding that the committee on a standard classification of accounts of the associations, then conferring with the Interstate Commerce Commission over the uniform system of accounts, would necessarily define certain terms. So far as terms are defined in the new classification of accounts, agreed upon by the classification committee and the Interstate Commerce Commission, they are of course binding on the Accountants' Association.

While the standard classification is therefore the logical starting point for part of the work of the committee on Accounting Definitions another consideration should be borne in mind. That is that since the standard classification is promulgated by the Interstate Commerce Commission it is the prescribed legal system for carriers which do an interstate business. Its definitions are binding on such carriers.

Similarly, intrastate carriers located in states where commissions have prescribed uniform accounts are bound by the text of those accounts and accompanying definitions. Various state commissions have adopted the Interstate classification, the association classification. Several years before the present classification was issued, however, some of the state commissions had adopted systems that, however little they differ in principle from the standard, contain differences in detail.

For the information of the association the committee showed in an appendix to the report certain definitions which it had compiled. So far as the commission definitions are concerned it does not present these as a full compilation of all of the definitions of all of the commissions. Some of the commissions which have prescribed forms of accounts have not included therein any definitions of terms which are of interest in the work assigned to the committee.

The committee expressed the hope that the compilation may be useful for reference and that it will serve to direct more general attention to the desirability of a uniform use of terms. The definitions quoted were from the uniform classifications of the Interstate Commerce Commission, The New York Public Service Commission, First District, the Board of Public Utility Commissioners of New Jersey, and the Public Service Commission of Maryland. The Century Dictionary and the Board of Supervising Engineers, Chicago Traction are also quoted. The committee realized that all definitions of this kind are somewhat arbitrary, and that a compilation of this character may be extended much further so as to include definitions, especially on the questions raised by public valuation of the property of public

The committee expressed appreciation of the great desirability of a standardized use of terms, and of the fact that the standardized use of terms is somewhat dependent on standardization of the practices underlying the terms which it is desired to define accurately. With the adoption of the new classification of accounts the ideal of complete standardization in electric railway accounts is brought nearer to realization and there will be a corresponding advance in the standardized use of terms. For the realization of this ideal time will be required.

The committee decided to present the data which it secured and to leave the question of future activities to the association or the executive committee. Whether or not it is the desire of the association that independent definitions shall be formulated or adopted, the committee believed that a service can be rendered to the association by the presentation from time to time of rulings or other information that will tend to make accounting terms clearer.

REPORT OF THE BOARD OF ACCIDENT PREVENTION

At a joint meeting of the Claims, Engineering and Traffic & Transportation Associations held yesterday morning, the board of accident prevention presented the results of an investigation by a sub-committee. These related to practical accident prevention through the employment of physical agents such as equipment, safety devices, ordinances, traffic regulations and laws; and to educational methods designed for the general public, school children and employees and utilizing safety committees, the press, lectures, bulletins, moving pictures and slides. A series of twenty-four questions were addressed to the member companies and thirty-five contributed to the report. As a result the committee reported that practical accident prevention is being accomplished through the use of improved equipment, and of safety devices, and through the education of employees. It urges co-operation with municipal authorities in regard to safety zones, traffic regulation, etc., and emphasizes the duty of state and municipality to educate the public along safety lines. The committee appended to its report a list of the answers to the questions received from the thirty-five co-operating companies.

REPORT OF THE COMMITTEE ON EDUCATION

The Accountants' Association committee on education reported yesterday morning. The report stated that the enrollments in the correspondence course in electric railway accounting were of sufficient number to assure its establishment. This course is to be conducted by Professor John R. Wildman, of New York University. An outline of the course was printed in the issue of the ELECTRIC RAILWAY JOURNAL for May 30, 1914, page 1214. In promulgating this plan the committee sent out two letters describing the course but, desiring to treat the project from a dignified standpoint, after placing the appeal and prospectus of the course before the member companies, the committee sought to develop local interest through personal solicitations.

An analysis of the enrollments indicated that the demand for wider knowledge of the subject through this course lies with the smaller companies. The large corporations did not furnish their expected quota. The committee stated that the successful outcome, apart from the individual efforts of each member of the committee, was largely due to the interest and material assistance given by P. S. Young, treasurer Public Service Railway; H. H. Norris, ELECTRIC RAILWAY JOURNAL, and Secretary E. B. Burritt. Particular recognition was given Mr. Burritt for his continued support and services.

The first lecture will be mailed to subscribers on or about Oct. 19, 1914. The prospectus of the course is unchanged from that presented in our previous report. The committee will award a prize of $25 for the best work done on the course during the current year.

THE ORGANIZATION AND FUNCTIONS OF A VALUATION STAFF

An interesting paper on this subject was presented at the session of the American Association yesterday by H. C. Donecker, assistant general manager Public Service Railway, Newark, N. J. The author first referred and quoted from various authors on the subject, including Henry E. Riggs, who delivered a paper on the valuation of public service corporation property before the American Society of Civil Engineers in January, 1911, from the books of Horatio Foster, Henry Floy and H. P. Gillette, and from magazine articles or reports of J. Shirley Eaton, Professor Pence, and others. He then discusses the organization of a company valuation staff. An abstract of his remarks on this subject follow:

ORGANIZATION OF A COMPANY VALUATION STAFF

The advantages of a home organization are apparent, as undoubtedly the members of the various departments who would be required to engage in the work, granted their competency, are, through their greater familiarity with the growth and history of the component parts which go to make up the entity of the operating company, in a position better to determine the real value of the property under their jurisdiction than outsiders without this intimate personal knowledge, could possibly be.

It is not surprising that in actually planning the organization to take care of such work, companies which have utilized the committee plan to good advantage in dealing with other important matters should look with favor on this method of conducting the work. Such a committee would embrace representatives from the accounting, way, equipment, transportation, power, purchasing and legal departments, each member being held responsible for that portion of the work which would logically come under his direction. Regular meetings of the staff would be held at which opportunity would be afforded for a discussion of important problems. Detailed minutes of the proceedings would be kept and periodical progress reports would be submitted to the management.

Although considerable time would probably be consumed in reaching a decision as to governing principles, in outlining distinctly the methods to be followed and in definitely planning the details, yet the work, when once organized, could be carried out more expeditiously than by a corps of experts who must of necessity spend considerable time in drawing upon the fund of information of the company's employees. It must be borne in mind also that in any appraisal by professionals the company must co-operate in no small degree, and the placing of data in their hands entails no trifling expense.

It may be true, also, as has been frequently stated, that departmental heads show comparatively little interest in the work of outside appraisers, with the consequence that there is a lack of understanding as to methods pursued, and the progress of the work not being closely followed dissenting views are not expressed until the final results are presented. Then arise questions as to the conclusions reached, and much effort is subsequently expended to make such corrections, modifications and additions as seem advisable and maybe essential. Such complications would be avoided to a large extent were the work directed by the company's valuation staff.

Of paramount importance is the foundation work connected with appraisals, that is, the inventory itself. Mr. Floy states that "nothing is more important than the inventory." In fact the whole valuation fails if the inventory is not complete and accurate. To make a proper and reliable inventory of a large property involves an amount of detail that will seem unduly laborious with an accompanying unwarranted expense to those inexperienced in appraisal work. Ordinarily it is the most difficult and expensive part of the work and will run from 50 to 75 per cent of the total cost of the appraisal. Under the committee plan of organization each departmental head will naturally assume the responsibility of completing an inventory of his own property. The general methods of conducting an inventory have been given in more or less detail heretofore and, of course, will have been considered by the valuation staff in general conferences before the work is started and while it is in progress.

As an illustration of a concrete instance where a company has itself undertaken the actual details of the work of an inventory of its property, we might quote from R. B. Rifenberick's description of the methods followed in Detroit:

"The track, mechanical and power departments are the ones which would have particularly to do with an inventory, as the physical property is in the direct charge of these departments. * * * Therefore the inventory was divided into the three general headings of inventory, track department; inventory, mechanical department: and inventory, power department, to which I added 'inventory general' to take care of real estate and buildings. * * * I concluded that the men who were in constant every-day connection with the property itself would be more capable than anyone whom I could secure from the outside, as such outside assistance could not possibly be as familiar with the property as must be the men in the regular employ of the company, who had in many cases been with the property for years. I took this subject up with each of the heads of the general departments and had them assign men out of their departments who were most familiar with the different schedules of the property to be inventoried, and they were put to work inventorying every item of physical property that they could ascertain. These men went into every schedule in as great detail as they could and were instructed to be sure and get everything that they could see and to be very careful not to put anything in their inventories that they could not at any time put their hands on and say 'There is that in the inventory'. * * *

"Our experience in this work fully confirms the conclusion I reached before getting up the organization for the purpose of taking the inventory, and I know of no better plan or organization that could be provided. * * *

"After arriving at material and labor cost * * * then should be added: (1) contingency item; (2) incidentals of construction item; (3) employers' and public liability insurance item; (4) builder's risk or casualty insurance; (5) architect's fee; (6) appreciation item; (7) acquiring land item; (8) contractor's profit item."

In addition, Mr. Rifenberick would include in the total reproduction cost overhead charges covering brokerage charge, discount on bonds, development cost, engineering charge, franchise value, going concern value, "hazard" charge, interest during construction charge, legal expense charge, organization and administration charge, promotion charge, taxes during construction charge and working capital charge.

Upon the completion of the inventory, the accounting and engineering departments must confer as to the value to be assigned to the various items. The operating department's knowledge of the present-day value and efficiency of the property also aids materially in reaching a right decision, while the purchasing department is called upon to furnish information as to past prices, details as to the circumstances under which the contracts for materials were made, etc. The accounting department is informed as to any unusual circumstances which may have attended the construction of the particular unit, all of which must be given weight in any equitable determination of its value. Thus no value appears on the inventory which cannot be substantiated by the company's records of cost are upheld by the experience of its engineers.

The legal department must be in close touch with the development of the valuation, and to it is relegated the preparation of evidence to establish a value upon the basis which has been adopted, also the rendering of opinions as to the value of easements, contracts, franchises and such other intangibles as may be involved.

When the original valuation has been finally completed, the problem of keeping it up to date arises. This means that as soon as any piece of construction is completed, the engineers and accountants must examine all the records of cost of that particular job and correct any errors or improper charging of labor, material or expense. The actual unit costs of the job must be determined and reconciled with previous estimates. Just as careful attention must be given to an accurate determination and record of the amount to be written off in reconstruction work. It is then a comparatively simple matter to bring the completed appraisal, as previously made, up to date each year.

PROBLEMS BEFORE STAFF

At the risk of some repetition, we here touch upon some of the practical problems to the proper solution of which the valuation staff, in conference, must give serious consideration. These involve:

1. Permanent inventory records. Where inventories are to be of value to the purchasing department, the operating department, the accounting department, and the valuation staff, the practical problem arises as to the most satisfactory form of inventory to serve such divers uses in a permanent manner.

2. Present-day and cost prices. There have been variations in the unit costs of construction since the company's property has been placed in operation and a study of these changes is essential. If the basis of prices is to be the reasonable cost of construction to the company, the question arises as to whether the company is not entitled in any fair appraisal to the difference between actual unit costs and those normally obtaining because of its superior bargaining ability and economical construction. If the basis of prices is to be the price of duplication, the question as to whether such prices should be present-day or average prices for an arbitrary period, such as the past five years, requires similar study.

3. The increased cost of piecemeal over completed construction. Properties built up part by part have not and could not be built with the same efficiency and economy that would be possible if the entire property were rebuilt, as a whole.

4. The increased cost of construction of property, such as track, while under operation, as compared with new construction without the difficulties of operation.

5. The inter-department charges making up the total cost of labor and material, including the cost of handling materials and stock and its transportation to the construction work, its incurrence while work is in process of construction, the cost of obtaining labor, the cost of employee's liability during construction, losses due to inclement weather and sickness, the cost of experimental work, and numerous similar problems, arising out of the diversity of construction conditions.

6. The overhead charges and their application; supervision of material and labor during construction and the inspection of the completed work prior to its being placed in operation.

7. The legal expenses involved during construction and the cost of money tied up in materials and supplies during the period of time which is needed to complete the work.

8. If the appraisal takes into account present, or depreciated, value of the property, the problems arising are numerous and involve the inspection of each unit of equipment and the determination of its remaining value as a part of the entire operating property.

The prime function of a valuation staff is to provide the company with an accurate and up-to-date appraisal, and while we may question the desirability of valuations in themselves, those who have given the subject deep consideration and have actual experience along this line point to certain incidental purposes which a valuation staff may serve. Aside from the features to which reference has already been made, as, for instance, the proper recording of costs, values, etc., involved in the reconstruction of the property as well as in its original installation, another important advantage is said to accrue, namely, the assistance which such a valuation staff can afford the legal department, particularly in cases where the question of reasonable return is involved.

It would also seem to be fair to assume that the contact of each department with every other as afforded by the committee form of valuation staff organization, is certain not only to broaden the viewpoint and make the employee of greater value to the company itself, but also to result in greater reliability of records where such a committee performs conscientiously its proper functions in checks and balances before the final figure enters into the property account of the company.

In conclusion, we reiterate the statement made early in this discussion, that we are facing definite conditions and not untried theories, in substantiation of which it might be well to call attention to an order of the Railroad Commission of the State of California that the electric railways within its jurisdiction file within 120 days inventory and appraisals of the cost and value of their property.

Finally, let it be understood that the object of this paper is not to provide an argument on the subject of valuation, but merely to cite certain attendant conditions of which the writer has some knowledge. There is, and perhaps always will be, honest differences of opinion as to the ultimate benefits to be derived from the application of the valuation theory.

ELEVATED RAILWAY TRAFFIC IN NEW YORK

The Public Service Commission of the First District of New York has just published the results of the operations of the four elevated lines of Manhattan and the Bronx for the year ending June 30, 1914. From this it appears that, although there was a considerable decrease on the Sixth Avenue line, there was, on the whole, an increase of 4,626,562 passengers carried for the year, and that the total number of passengers carried on the elevated lines during the year was 311,473,568. With these figures may be compared the record made by the subway for the same period. It carried 340,413,103 passengers, or 1,001,215 a day, which means that the Interborough system is used every day of the year by 1,917,315 passengers, or 651,886,671 in the year, counting 340 days to the year. Taking the four elevated lines separately, the Third Avenue carried 4,260,856 more passengers in 1914 than in 1913, a daily increase of 12,532, almost three times as heavy an increase as that of the preceding twelve months. The Sixth Avenue carried 497,248 fewer passengers than in 1913, and its record of 255,173 passengers a day was not only 1463 less than in 1913, but 721 less than in 1912. Both the Second Avenue and the Ninth Avenue lines gained moderately last year, the former scoring a 595,660 and the latter a 269,294 increase total over the preceding twelve months.

A red band or signal, which can be displayed diagonally across the illuminated route number on the front of the car, is being installed by the Philadelphia Rapid Transit Company to indicate when a car is destined to turn "short" of the usual run or is scheduled to go into a depot before reaching the end of the line. The cars of Routes 20, 21 and 53 have been equipped with this red band. The red band can be dropped into place by the motorman for the purpose of calling the attention of prospective passengers to the fact that the car is carrying a "short" destination sign immediately beneath the route number so that passengers may avoid boarding a car which is designated to turn before reaching the through terminal. If the new device proves to be a convenience to the traveling public it will be installed on all cars having the illuminated sign system.

REPORT OF THE SECRETARY-TREASURER OF THE AMERICAN ASSOCIATION [*]

The question of membership is always a vital one, and it is a pleasure to state that the growth of the association in this respect has been steady. We are slowly, but surely, gathering into the fold those companies which yet remain outside. It is interesting to note that our organizaion includes 36,000 of the 43,000 miles of electric railways in the United States and that of the $533,000,000 in revenues received by the companies in 1913, $500,000,000 were received by our member companies. This indicates that the association is truly representative of the electric railway industry of this country.

The individual membership has increased during the past year in a very satisfactory manner. This branch of membership is a potent factor for good and the recruiting should be aided in every possible way by every individual connected with the organization. The individual members should number many thousands.

The company section movement continues to spread. Two new sections were formed during the year, the Washington Railway & Electric Company section and the Manila Electric Railway & Light Company section, and two others are in process of formation. The organization of company sections should be encouraged as a sure means of increasing this membership. The value of the company section is difficult to overestimate. Each of our larger member companies should have a section among its employees, and executives of these companies should lend their support to the movement.

CASH STATEMENT

RECEIPTS

(Fiscal year ended Sept. 30, 1914)

Cash in bank, Oct. 1, 1913		$5,012
Admission fees	$230	
Company annual dues	38,328	
Individual membership dues	13,810	
Interest on bank deposits	369	
Sale of annual reports	330	
Sale of rule books	322	
Sale of classifications	82	
Sale of pamphlets	24	
Sale of membership emblems	458	
Index bureau	1,531	
Miscellaneous	435	
Aera advertisements and cuts	6,367	
Aera subscriptions	241	
Sale of *Aera* binders	75	
Manufacturers' Association contribution to support of *Aera*	5,970	
Sale of Engineering Manual and binder	519	
Contribution to fare bureau	1,000	
Refund of petty cash	600	
Proportional share of convention reporting from ELECTRIC RAILWAY JOURNAL	344	
Checks redeposited	114	
Receipts during fiscal year ended Sept. 30, 1914		71,156
Total cash, including balance of Oct. 1, 1913		$76,168

EXPENDITURES

(Fiscal year ended Sept. 30, 1914)

Salaries	$12,362
Printing and stationery	2,976
Postage	1,807
Miscellaneous office expenses	490
Rent of office	3,073
Telephone, telegraph and messengers	690
Express, freight and cartage	1,286
Traveling expenses, secretary	254
Traveling expenses, executive committee	37
Traveling expenses, other committees	1,346
Miscellaneous general expenses	2,085
1913 convention	996
1914 convention	95
Publicity for 1913 Convention	200
Annual report	2,724
Return of active membership dues	75
Return of individual membership dues	85
Furniture and equipment	459
Exchange	52
Accountants' Association, annual report	1,071
Accountants' Association, other expenses	1,705
Engineering Association, annual report	5,066
Engineering Association, other expenses	3,531
Claims Association, annual report	906
Claims Association, other expenses	903
Transportation & Traffic Association, annual report	2,427
Transportation & Traffic Association, other expenses	1,437
Petty cash fund	600
Index bureau	779
Washington Representative	491
Aera	14,594
Fare bureau	2,433
Badges	265
Money refunded later	174
Engineering Manual and binder	3,217
Checks returned from bank	115
Gold medal	171
Total expenditures, fiscal year ended Sept. 30, 1914	$70,993

RECAPITULATION

Cash on hand Oct. 1, 1913	$5,012	
Receipts during fiscal year ended Sept. 30, 1914	71,156	
Total cash		$76,168
Expenditures during fiscal year ended Sept. 30, 1914		70,993
Balance in bank Sept. 30, 1914		$5,175
Bills receivable Sept. 30, 1914:		
Contributions to fare bureau	$1,000	
Outstanding company and individual membership dues	250	
Aera advertising	850	
Convention receipts (estimated)	6,000	
		8,100
		$13,275
Bills payable Sept. 30, 1914		8,006
Balance as of Sept. 30, 1914		$5,269

[Statements were added from the Security Bank, New York, verifying the bank statement submitted, and from M. R. Boylan, general auditor Public Service Railway, Newark, N. J., as auditing the report and finding it correct.]

RECAPITULATION OF COMPANY MEMBERS

Sept. 30, 1914

Company members Oct. 1, 1913			391
Resigned		15	
Consolidated		5	
Delinquent		12	
			32
Total 1913 company members in good standing			359
Company members reinstated during fiscal year ended Sept. 30, 1914			2
Total old company members in good standing Oct. 1, 1914			361
New company members admitted during the year ended Sept. 30, 1914		23	
Delinquent	4		
Resigned	1		
		5	
New company members in good standing Sept. 30, 1914			18
Total company members in good standing Sept. 30, 1914			379

RECAPITULATION OF INDIVIDUAL MEMBERS

Sept. 30, 1914

Individual members, Oct. 1, 1913			2,885
Resigned		598	
Deceased		23	
Delinquent		265	
Membership cancelled owing to individual's affiliation with non-member companies		98	
			884
Total old members in good standing Sept. 30, 1914			2,001
Individual members reinstated during fiscal year		10	
Delinquent	4		
Withdrawn	2		
		6	
Total reinstated members in good standing Sept. 30, 1914			4
Total 1913 members in good standing Sept. 30, 1914			2,005
New individual members			893
Total individual membership Sept. 30, 1914			2,898

The value of the association magazine, *Aera*, has been thoroughly demonstrated. Its circulation has increased with the increase in membership, and it is maintaining a standard befitting the official organ of this association. Mention should be made of the publicity work which is being accomplished through the magazine. Newspapers to the number of 1196 are supplied each month with clippings from *Aera*. By this means much enlightening information relative to the operation of electric railways is published throughout the country and the effect cannot help but be beneficial.

A noteworthy step was taken during the year in the establishment of the Bureau of Fare Research under the direction of the committee on cost of passenger transportation service. F. W. Doolittle was selected by the committee as the bureau's director and took charge some five months ago. He is eminently well qualified for the important work devolving upon the bureau.

The new method of distributing the proceedings, as authorized by the executive committee was put into operation for the first time this year. This plan has resulted in a considerable saving in the cost of printing and express charges, the total amount saved over last year being approximately $1,500.

---

[*] Abstract of report for the fiscal year ended Sept. 30, 1914, presented at the meeting of the American Association, Atlantic City, N. J., Oct. 13, 1914.

Another innovation this year was the association's Year Book. In this is presented in convenient form a great deal of information bearing on the organization and work of the association.

Still another departure, and a very important one in its value to the members of the association, was the publication of the Engineering Manual. This book contains all standards and recommendations adopted to date, together with much other important information. It has been favorably received and its usefulness to the electric railway man is established.

The bureau of information has at times this year been heavily taxed and it has been difficult to keep up with the many requests for information of one sort or another. There were received during the year about 325 requests for information on a large variety of subjects, which received attention at the hands of the bureau. It is satisfactory to note that this important feature of association work is being taken advantage of by a constantly increasing number of member companies. It is appropriate to acknowledge here the active co-operation on the part of member companies in the supplying of data in connection with the work of this bureau.

During the past year eighty-four committee meetings were held. Co-operation of our companies has likewise been given freely in response to requests for information from various committees in the course of their work.

I desire to express my earnest appreciation of the loyal support accorded me by the members of our office force. They have been at all times faithful to the association's work.

I also wish to express my appreciation of the assistance which has been extended to me during the year by my predecessor, H. C. Donecker, and of the whole-hearted support accorded me by the membership generally.

UNIVERSAL STANDARD BOILER SPECIFICATIONS

During the month of September the committee appointed by the American Society of Mechanical Engineers to prepare specifications for the construction and care of steam boilers held several meetings for the purpose of bringing out discussion on a proposed draft for the specification. Mention of the first of these meetings, which was held Sept. 15, was made in the ELECTRIC RAILWAY JOURNAL for Sept. 5. At this hearing numerous representative users of steam boilers spoke in favor of the general adoption of a single standard boiler code, and this attitude was heartily concurred in by representatives of the Babcock & Wilcox Company, the National Tubular Boiler Manufacturers' Association, the American Boiler Manufacturers' Association, and the National Association of Steam & Hot Water Fitters.

The technical part of the hearing was opened with a general discussion on the proposed code with special reference to the matters of license and inspection laws. A discussion upon safety valves occupied a considerable portion of the afternoon but this was finally discontinued to enable a delegation from the National Association of Thresher Manufacturers to be heard. Following this, a committee of the American Society of Heating and Ventilating Engineers was heard, and then the meeting was thrown open to the discussion of the question of boiler material. This discussion was continued without recess until the adjournment at 8.30 p. m.

A committee composed of the representatives of the American Boiler Manufacturers' Association and the National Tubular Boiler Manufacturers' Association conducted a private meeting that lasted throughout the day of Sept. 16. In this the preliminary report was discussed from all standpoints and very carefully considered for its application to the boiler manufacturing industry. The result of their work was a comment on the specification for boiler material suggested by the Association of American Steel Manufacturers, some further criticism of the details of the report and finally the formation of a permanent organization for the purpose of taking definite action for the introduction of the code, after its acceptance by the society, into the legislatures of the various states. This meeting was finally adjourned until Tuesday, Sept. 29, on which date a general meeting of boiler manufacturers was called at Pittsburgh, Pa., for the purpose of furthering the work initiated in New York.

On Sept. 26 the committee representing the boiler-tube interests met in a second conference with the boiler specifications committee and presented a complete specification that is proposed for boiler tubes, both lap-welded and seamless. A representative of the National Association of Master Steam and Hot Water Fitters appeared before the committee and expressed the approval of that association of the committee's work and particularly the changes recommended by the National Boiler & Radiator Manufacturers' Association and the American Society of Heating & Ventilating Engineers. Following this, conferences were held with representatives of the railroad associations and the safety valve manufacturers, both of which were, however, adjourned to later dates at which specific recommendations yet to be formulated will be presented.

BERLIN TRAFFIC LOSSES ON ACCOUNT OF WAR

That the effect of the war is beginning to make itself felt in Germany is shown by the August statements of the Berlin rapid transit and surface companies. The Berlin Elevated & Underground Railway Company (exclusive of the Schöneberg, Wilmersdorf and Dahlem municipal leased lines) carried 4,951,792 passengers in August of this year, compared with 5,610,011 for the same month in 1913. There was a corresponding reduction in revenue during the month from $184,993 to $160,541. This company recently turned over to the army sixty auto buses which it had just purchased for feeder service.

The August revenue of the Allgemeine Berlin Omnibus Company decreased from $276,294 to $213,540. One reason for the reduction is that the number of vehicles was cut down two-thirds because many buses and horses were taken for war purposes.

The report of the Grosse Berliner Strassenbahn shows a loss of about $75,000 compared with August, 1913, when the earnings were $913,849. The company not only lost a large number of regular riders but made a further sacrifice in voluntarily refunding credits for the unexpired commutation of all patrons called to the colors. Immediately after mobilization many women from the families of employees took their places, but this condition was temporary as men are now being trained to enter the service at regular wages.

The annual report of the Singapore Electric Tramways & Power Company for 1913 presents "for the first time a balance on the right side," the year's profits having been $45,672. The tramway has 15 miles of track, and carried more than 16,00,000 passengers last year, an increase of nearly 2,200,000 over the previous year. Receipts per car-mile were 19 cents in 1913, against 17 cents in 1912. No dividend was paid, the concern having purchased at various discounts $260,843 of its own debentures, of which $163.513 have been canceled and $97,330 kept alive and carried as a credit. The capital now stands at $486,650. The chairman states that the company anticipates starting annual dividends next year.

HISTORICAL NOTES ON HORSE AND ELECTRIC CAR SERVICE IN ATLANTIC CITY

By George F. Faber, General Superintendent Atlantic City & Shore Railroad.

In view of the description of the new shops of the Atlantic City & Shore Railroad printed in the issue of the Electric Railway Journal for Oct. 10, the following historical notes may prove of interest.

The Camden & Atlantic Railroad Company was organized on June 24, 1852, and the construction of a railroad between Camden and the shore was begun a few weeks later. Tracks were laid on Atlantic Avenue in 1854. About 1865 two brothers secured from the railroad company the right to run cars on this avenue from the Inlet to South Carolina Avenue. The equipment comprised two cars and four horses, the owners acting as driver and conductor. After a short time their lease was taken over by another individual, but in 1869 the railroad refused to continue the lease and since that year has been operating the line.

In 1869 the Atlantic City Horse Car & Railway Company was organized and, after much difficulty, secured from the City Council the right to construct a line from a point on New Hampshire Avenue near the Inlet, in the center of that avenue to Atlantic Avenue, thence to Ohio Avenue, thence on Ohio Avenue to Pacific Avenue and on Pacific Avenue to the Excursion House at the foot of Missouri Avenue; also, from the intersection of Michigan and Pacific Avenues, via Michigan and Atlantic Avenues to Ohio Avenue, joining the other track at that point. The Camden & Atlantic Railroad, however, secured an injunction and stopped the construction on Atlantic Avenue and put an end to the enterprise excepting that the organization was continued.

In 1889 the electric trolley system was introduced and four years later the line was extended to Longport. Experiments with electric heating on the Burton system were begun in 1892, and the present, now known as the Consolidated, system was installed on a small scale in 1895 and completely in 1898.

The next venture in traction lines was the Atlantic City & Suburban Traction Company, organized in 1902 with a 33-year franchise. The company has a single track extending from the foot of Florida Avenue to the bridge across the Thoroughfare at Georgia Avenue, and thence across the Meadows to Pleasantville, Somer's Point and Absecon. Service on this line commenced in 1903.

The Central Passenger Railway Company secured a franchise for tracks on Virginia, Adriatic and South Carolina Avenues in 1903. After being held up by injunction the construction was completed on the first-named avenue only and the first car was operated the following year. It was planned to use the Pullen underground contact system on this line.

The above statements bring this historical sketch down to the year 1904. The more recent developments were covered in the Electric Railway Journal article already referred to. The property is now owned or controlled by the Pennsylvania Railroad through the West Jersey & Seashore Railroad, the direct owner of the larger portion of the property. The system is operated by the Atlantic City & Shore Railroad, which leases the rights of other companies having franchises and physical property in the city and immediate vicinity. The organization of the underlying companies are, however, maintained intact.

C. N. Duffy, vice-president and general manager Manila Electric Railroad & Light Company, was chairman of the arrangement committee at a reception given to Rev. J. J. Harty, archbishop of Manila, upon his return to the Philippine Islands on Aug. 3. The speakers at the reception included Governor General, Francis Burton Harrison and the Mayor of Manila.

BRILL'S LOW LEVEL HIGH-LIFE CARS ON RADIAL TRUCKS

The J. G. Brill Company is exhibiting one of the Third Avenue Railway Company's splendid low-level cars on the Boardwalk opposite the Pier, and electric railway men who want to see what conveniences can be incorporated in the once-despised "single-trucker" should not fail to go over it. Although this car is but 22 ft. 11½ in. over the corner posts and 34 ft. 11¾ in. over the buffers, it has a seating capacity of 46; thirty-seven passengers are accommodated in the body and nine on the platforms. There are no steps to the platforms as the height from pavement to patform is only 13 in.; from the platform to the car floor is 10½ in., and the floor of the car has a ramp of 3 in. in 5 ft. 1½ in. from the sill at each end. The car has a steel bottom frame and continuous steel posts; the sides are convertible, the arrangement being the "Third Avenue convertible system," which consists of panels with sashes interchangeable with wire screens.

The car is mounted on the Brill "Radiax" type of truck, which has a 10 ft. wheelbase and 24 in. wheels. The weight of the body, less electrical equipment, is 12,840 lb.; weight of truck, with two gears, 6140 lb.; the weight per seated passenger is 522 lb., and by lengthening the car 2 ft. 5 in., or one window, the weight per seated passenger will be 500 lb. The Brill Company has built forty-nine of these cars in two orders, all being mounted on "Radiax" trucks. A "Radiax" truck of 11 ft. 6 in. wheelbase is exhibited in the company's space on the pier.

SOME CONSOLIDATED LEADERS

The thermostat cabinets shown in operation by the Consolidated Car-Heating Company at space No. 22 demonstrated by graphic recording thermometer charts and by current consumption clocks the accuracy of temperature regulation and the economy in electric current which is effected by the use of this device. The thermostat employs the "Sylphon" flexible metallic bellows and is operated by the expansion of a liquid against atmospheric pressure. Break-down tests on both the thermostat and the magnetic switch controlled by the former show that they will operate more than 200,000 times without showing appreciable wear.

The electric heater features include the all-steel, lightweight construction with glazed porcelain, ventilated spindle for the coils which are made of the company's new non-corrosive wire "Nokoro." Fahnestock connectors for simplifying the wiring of the heaters are also employed. The company also shows an electric ventilating heater in which the outside air is blown by means of a fan over the resistance coils, and after being heated in this manner is distributed by means of a ventilating duct extending along the truss plank of the car. Another exhibit is a coal-burning type of ventilating unit. This heater is said to have absolutely no joints in the fire pot, the heater dome or the smoke jack nipple to permit the escape of coal gas. Fresh air to be heated is taken in by the fan either from the side or from the roof of the car, thus doing away with the objection of dust and odors which are drawn in when the air is taken through a hole in the car floor. The proportion of outside air can be regulated by a special damper according to temperature conditions.

One of the electric emergency trucks which the General Vehicle Company has supplied to both the New York and Third Avenue Railways has been installed for direct inspection at space 603 in company with ont of the company's 6-ft. industrial trucks. An idea of the various uses which an electric railway can make of the electric vehicle truck is obtainable from the company's reprint of the Electric Railway Journal's article of Sept. 5, 1914, on "Electric Motor Trucks for New York Railways."

THE EDUCATION OF TO-DAY

In the address on modern education, delivered yesterday before the Accountants' Association, John R. Wildman, professor of accounting New York University, drew some analogies between primitive and modern conditions and methods of education in making clear the significance of certain phases of the educational situation as it exists to-day. Primitive education is supposed to have been almost without conscious aim and not to have possessed any genuine ideals, either political, social or moral. In the case of modern education, developed under an ever-increasing complexity of civilization, ideals do exist, but opinions differ greatly as to what is the central aim. Proponents are found for moral character, culture and mental development. Professor Wildman is not opposed to the attainment of these personal attributes, but he takes exception to the worship of these ends as such and to some of the means whereby they are attained.

In Professor Wildman's opinion the ideal education is that which enables one to adapt himself harmoniously to his environments and to utilize natural forces to serve him and his fellows in their needs. Young men should be taught how to get enough money to enable them to provide the necessities, both physical and intellectual. The modern educational system should educate primarily for business but in a way conducive to a strong mind and a fine moral character. The primitive educational method of imitation has been largely abandoned. Modern business education necessitates determining exactly what young men should know and then teaching them this in accordance with the latest and most improved methods for actually conducting business.

Business education, however, is not confined to a study of simply one profession, for every true business man must know certain fundamentals of commerce, accounts and finance. The accountant must naturally study the theory and practice of accounting, but not without regard to the relations which accounting bears to economics, law, finance and business organization. Professor Wildman believes that accountants who have been thus trained perform their work with a clear consciousness of what they are doing instead of serving in a merely routine and perfunctory manner. Moreover, such an education cannot be said to be devoid of rewards, for the knowledge of the subject and the rendering of maximum service to the employer result not only in financial but also in intellectual and moral betterment.

REPORT OF COMMITTEE ON EDUCATION

The work of the committee on education of the American Association has comprised two parts: (1) a study of existing practice in regard to apprentice training by member companies, and (2) preliminary arrangements for courses of instruction to be given by a correspondence school under the general auspices of the association. The committee found that very few companies have regular apprentice systems for training mechanics and that those which have apprentice systems do not, in general, have regular courses of training. There is apparently no instruction of a school nature given in the electric railway industry, nor is there any extensive co-operation with trade, vocational or night schools. There was a general interest manifested by the membership in the proposed correspondence courses and there is a good prospect of a reasonable enrollment as soon as the courses are put into operation. The committee presented a statement of the tuition fees for four courses: (a) mechanical shop course, (b) electrical shop course, (c) line and track-work course, and (d) power house and substation course. With the exception of the last-named, the fee for which is $37, the tuition fee is $30 for each course. Combinations of two courses can be taken at reduced rates. The committee proposes to follow closely the work of the students.

REPORT OF THE JOINT COMMITTEE ON TRANSPORTATION ENGINEERING

The joint committee on transportation engineering (Engineering and Transportation & Traffic Associations) reported yesterday on train operation in passenger service, train operation in freight and express service, and effect of car and equipment design on duration of stops. The report on train operation in passenger service does not amplify the arguments of last year's committee, but does present figures to show that on a 6600-volt single-phase line in the Middle West, the use of trains on a holiday permitted an increase of 158 per cent in seating capacity and of 122 per cent in ton-miles at an increase of only 76 per cent in energy consumption.

As to freight and express service, the committee found that with the increased length of trains and runs for the permissible lower schedule speeds the tendency is to use a single-motor car or electric locomotive with trailers instead of multiple-unit equipment. Train operation saved platform expense and energy while it was safer than single cars. In studying the effect of interurban car and equipment design on the duration of stops, the committee made eight plans of passenger, and six plans of freight cars. It found that the double-end two or three-compartment car was generally conceded to be the most flexible design, and it believed that end doors should be incorporated in all cars to meet possible train operation even if the end doors were not available to passengers on the short curves of city sections. Excessively large rear platforms were a mistake, and far less essential than easy steps. All bulkhead doors, except those at the baggage compartment, should swing instead of slide in order to permit stronger bulkheads and less cost for door maintenance. As to freight and express car design, the committee favored two large doors on either side, particularly where less-than-carload shipments are to be handled. In conclusion, the committee said that if electric railways are to take advantage of train operation economies they must be prepared to adapt their terminal facilities for longer trains.

REPORT OF COMMITTEE ON EXPRESS AND FREIGHT-ACCOUNTING

The committee on express and freight accounting in its first report presented yesterday before the Accountants' Association outlined in detail what are considered the best methods for keeping freight accounts in both agents' and auditors' offices. The system proposed covers in brief the entire field, not only for those companies who are already conducting an interline freight business but also for those who will eventually have such a source of revenue and those who now do only a local business but will in the future exchange shipments with other companies. The committee suggests thirty-one forms that are needed and explains in detail the accounting procedure that is to be applied from the time freight is accepted from shippers until all entries, reports and summaries are completed. The committee considers that the settling of balances due other roads for traffic accounts by allowing them to draw for such is the simplest method and involves the least work.

REPORT OF COMMITTEE ON STANDARD CLASSIFICATION OF ACCOUNTS

The eighteenth annual report of the committee on the standard classification of accounts presented yesterday before the Accountants' Association constitutes in general a résumé of the committee's activities from the inception of the Accountants' Association in 1897 up to the present date. Its influence in bringing about a standard classification of accounts and the development of this to suit the growth of the industry are briefly described. During the past two years, in co-operation with representatives of the Interstate Commerce Commission, the committee has been considering new classifications covering operating, revenue and road and equipment accounts, as well as schedules and text for income, profit and loss, and general balance sheet accounts. The committee held two protracted sessions last year with representatives of the commission and worked out the uniform system of accounts prescribed by the commission as effective July 1, 1914. This system, which has already been adopted by interstate electric railways and in many cases by state commissions, is recommended for adoption by the Accountants' Association. The report of the committee concludes with a list of all its past and present members with their respective periods of service.

COMMITTEE ON BLOCK SIGNALS

The joint committee on block signals of the Engineering and the Transportation & Traffic Associations presented in its report a digest of laws or rulings issued by the various states relative to block signals, a bibliography on signaling, and a summary of installations of block signals made during the year preceding July 1, 1914. A design for a semaphore spectacle casting was submitted for approval by the Engineering Association as standard, as was also a clearance diagram for semaphore signals. A set of rules for operation under trolley contact signals was included, and certain definitions now appearing in the standard block signal rules were revised to make them applicable to the requirements of trolley contact signals. The subject of light signals was discussed at length, and recommendations were made to the effect that, for light signals in high-speed interurban service, a lens of not less than 8⅜-in. diameter should be used and that in moderate-speed service a lens of not less than 5⅜-in. diameter should be used. In an appendix detailed descriptions of two types of automatic train stops were given.

The summary of replies to questions in the data sheet sent out each year by this committee included information as to the contemplated mileage of track to be protected by signals during the coming year and data upon the cost of signal maintenance and the efficiency of signal operation. Condensed data regarding the block signal installations made during the last year were also included. In another appendix the committee presented a study upon braking distance for trains at varying speeds, including a diagram with which any given problem of this nature could be solved by graphical means. Another appendix furnished brief descriptions of installations made by the various signal manufacturers during the last year.

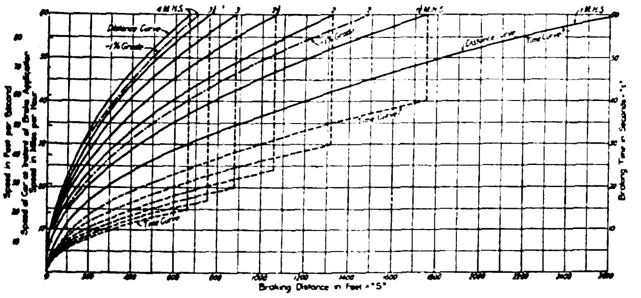

DIAGRAM FOR DETERMINING BRAKING DISTANCES AT VARIOUS SPEEDS

The above-mentioned diagram for determining braking distances at various speeds is shown in the accompanying illustration. To show how the chart is to be used assume that such a braking force has been applied to a car so as to produce a retardation of 3 m.p.h.p.s. It is desired to know how long a time will be required for the car to come to a stop and in what distance it will do so from a speed of say, 50 m.p.h. The solid line for 3 m.p.h.p.s. shows that a speed of 50 m.p.h. corresponds to a braking distance of 600 ft. Directly below this is a point where a vertical line intersects the distance-time curve for 3 m.p.h.p.s. and, reading on the right-hand scale, it is found that the time required for the stop is 16.5 seconds. A similar procedure shows that from 60 m.p.h. the same braking rate will stop the car in twenty seconds and 800 ft. The braking forces necessary to produce the various rates of deceleration are as follows:

Rotation	Braking force
1 m. p. h. p. s	91 lb. per ton
1½ m. p. h. p. s	137 lb. per ton
2 m. p. h. p. s	182 lb. per ton
2½ m. p. h. p. s	227 lb. per ton
3 m. p. h. p. s	273 lb. per ton
3½ m. p. h. p. s	318 lb. per ton
4 m. p. h. p. s	364 lb. per ton

The forces given above are those which must be applied tangentially at the car-wheel tread, the pressure from the brakeshoe being from four to eight times as great, depending on the coefficient of friction between the brakeshoe and the tire. As the forces are calculated for level track they must be increased 20 lb. per ton for each 1 per cent of upgrade and correspondingly reduced for each 1 per cent of downgrade. Referring to the chart the two dot-and-dash lines show the times and distances resulting from the application of forces on a 1 per cent downgrade which on the level would produce 4 m.p.h.p.s. and 2 m.p.h.p.s. retardation respectively. They are shown merely to give a practical concept of the effect of a familiar grade.

REPORT OF THE JOINT COMMITTEE ON THE JOINT USE OF POLES

The special committee on the joint use of poles, comprising representation from the American Institute of Electrical Engineers, the National Electric Light Association, the American Telephone & Telegraph Company and the American Electric Railway Association, presented its final report yesterday. It was the unanimous recommendation of the committee except that the telephone companies do not agree to enter into joint use of poles in any case where the voltage exceeds:

(a) 5000 volts constant potential, neither side grounded.

(b) 5000 volts constant current series alternating metallic (except when current does not exceed 7.5 amp, in which case the voltage may be not more than 10,000 volts).

(c) 7500 volts constant direct current series metallic.

(d) 700 volts constant potential, direct current, one side grounded.

The report comprises a form of agreement covering the joint use of wood poles on a rental basis and a set of recommended specifications for the joint use of wood poles. These take up in detail the placing of attachments and wires for various classes of circuits, including railway span wires and brackets. Included with the report are a number of dimensioned diagrams illustrating the principal specifications.

REPORT OF COMMITTEE ON COMPANY SECTIONS AND INDIVIDUAL MEMBERSHIP

The American Association committee on company sections and individual membership reported yesterday to the effect that two company sections had been organized during the year; the Washington Railway & Electric Company section, No. 4, and the Manila Electric Railway & Light Company section, No. 5. Several companies have taken steps in the direction of organizing sections. Sub-Chairman Martin Schreiber's midwinter convention paper entitled "A Plea for Company Sections" was a part of the year's campaign. (See Electric Railway Journal, Jan. 31, 1914, page 250.) An active and successful campaign for individual members has also been conducted continuously throughout the year.

The public utilities commission was discussing carload lots and less than carload lots, abbreviated to c. l. and l. c. l. Finally one of the commission (so the story runs) inquired: "Where is this C. L. and L. C. L. railroad?"

REPORT OF COMMITTEE ON COMPANY MEMBERSHIP

The American Association committee on company membership which met yesterday reported that an active canvass of possible members had been made throughout the year and that more than 400 members are now enrolled. These represent more than 80 per cent of the capital invested in the business. The remainder are principally small companies, and the committee reported the opinion that many of these will soon be enrolled. The committee has used a pamphlet, "Applying the Test," and the association year book in correspondence with prospective members.

REPORT OF THE COMMITTEE ON ACCOUNTING DEFINITIONS

The Accountants' Association committee on accounting definitions which reported yesterday was formed to present for consideration definitions that should promote a standardized use of various terms employed in accounting discussion and literature. The suggestion that such terms be defined arises from the confusing, sometimes misleading, use of words required in accounting. When the committee was asked to give attention to this subject it was with the understanding that the committee on a standard classification of accounts of the associations, then conferring with the Interstate Commerce Commission over the uniform system of accounts, would necessarily define certain terms. So far as terms are defined in the new classification of accounts, agreed upon by the classification committee and the Interstate Commerce Commission, they are of course binding on the Accountants' Association.

While the standard classification is therefore the logical starting point for part of the work of the committee on Accounting Definitions another consideration should be borne in mind. That is that since the standard classification is promulgated by the Interstate Commerce Commission it is the prescribed legal system for carriers which do an interstate business. Its definitions are binding on such carriers.

Similarly, intrastate carriers located in states where commissions have prescribed uniform accounts are bound by the text of those accounts and accompanying definitions. Various state commissions have adopted the Interstate classification, the association classification. Several years before the present classification was issued, however, some of the state commissions had adopted systems that, however little they differ in principle from the standard, contain differences in detail.

For the information of the association the committee showed in an appendix to the report certain definitions which it had compiled. So far as the commission definitions are concerned it does not present these as a full compilation of all of the definitions of all of the commissions. Some of the commissions which have prescribed forms of accounts have not included therein any definitions of terms which are of interest in the work assigned to the committee.

The committee expressed the hope that the compilation may be useful for reference and that it will serve to direct more general attention to the desirability of a uniform use of terms. The definitions quoted were from the uniform classifications of the Interstate Commerce Commission, The New York Public Service Commission, First District, the Board of Public Utility Commissioners of New Jersey, and the Public Service Commission of Maryland. The Century Dictionary and the Board of Supervising Engineers, Chicago Traction are also quoted. The committee realized that all definitions of this kind are somewhat arbitrary, and that a compilation of this character may be extended much further so as to include definitions, especially on the questions raised by public valuation of the property of public

The committee expressed appreciation of the great desirability of a standardized use of terms, and of the fact that the standardized use of terms is somewhat dependent on standardization of the practices underlying the terms which it is desired to define accurately. With the adoption of the new classification of accounts the ideal of complete standardization in electric railway accounts is brought nearer to realization and there will be a corresponding advance in the standardized use of terms. For the realization of this ideal time will be required.

The committee decided to present the data which it secured and to leave the question of future activities to the association or the executive committee. Whether or not it is the desire of the association that independent definitions shall be formulated or adopted, the committee believed that a service can be rendered to the association by the presentation from time to time of rulings or other information that will tend to make accounting terms clearer.

REPORT OF THE BOARD OF ACCIDENT PREVENTION

At a joint meeting of the Claims, Engineering and Traffic & Transportation Associations held yesterday morning, the board of accident prevention presented the results of an investigation by a sub-committee. These related to practical accident prevention through the employment of physical agents such as equipment, safety devices, ordinances, traffic regulations and laws; and to educational methods designed for the general public, school children and employees and utilizing safety committees, the press, lectures, bulletins, moving pictures and slides. A series of twenty-four questions were addressed to the member companies and thirty-five contributed to the report. As a result the committee reported that practical accident prevention is being accomplished through the use of improved equipment, and of safety devices, and through the education of employees. It urges co-operation with municipal authorities in regard to safety zones, traffic regulation, etc., and emphasizes the duty of state and municipality to educate the public along safety lines. The committee appended to its report a list of the answers to the questions received from the thirty-five co-operating companies.

REPORT OF THE COMMITTEE ON EDUCATION

The Accountants' Association committee on education reported yesterday morning. The report stated that the enrollments in the correspondence course in electric railway accounting were of sufficient number to assure its establishment. This course is to be conducted by Professor John R. Wildman, of New York University. An outline of the course was printed in the issue of the Electric Railway Journal for May 30, 1914, page 1214. In promulgating this plan the committee sent out two letters describing the course but, desiring to treat the project from a dignified standpoint, after placing the appeal and prospectus of the course before the member companies, the committee sought to develop local interest through personal solicitations.

An analysis of the enrollments indicated that the demand for wider knowledge of the subject through this course lies with the smaller companies. The large corporations did not furnish their expected quota. The committee stated that the successful outcome, apart from the individual efforts of each member of the committee, was largely due to the interest and material assistance given by P. S. Young, treasurer Public Service Railway; H. H. Norris, Electric Railway Journal, and Secretary E. B. Burritt. Particular recognition was given Mr. Burritt for his continued support and services.

The first lecture will be mailed to subscribers on or about Oct. 19, 1914. The prospectus of the course is unchanged from that presented in our previous report. The committee will award a prize of $25 for the best work done on the course during the current year.

THE ORGANIZATION AND FUNCTIONS OF A VALUATION STAFF

An interesting paper on this subject was presented at the session of the American Association yesterday by H. C. Donecker, assistant general manager Public Service Railway, Newark, N. J. The author first referred and quoted from various authors on the subject, including Henry E. Riggs, who delivered a paper on the valuation of public service corporation property before the American Society of Civil Engineers in January, 1911, from the books of Horatio Foster, Henry Floy and H. P. Gillette, and from magazine articles or reports of J. Shirley Eaton, Professor Pence, and others. He then discusses the organization of a company valuation staff. An abstract of his remarks on this subject follow:

Organization of a Company Valuation Staff

The advantages of a home organization are apparent, as undoubtedly the members of the various departments who would be required to engage in the work, granted their competency, are, through their greater familiarity with the growth and history of the component parts which go to make up the entity of the operating company, in a position better to determine the real value of the property under their jurisdiction than outsiders without this intimate personal knowledge, could possibly be.

It is not surprising that in actually planning the organization to take care of such work, companies which have utilized the committee plan to good advantage in dealing with other important matters should look with favor on this method of conducting the work. Such a committee would embrace representatives from the accounting, way, equipment, transportation, power, purchasing and legal departments, each member being held responsible for that portion of the work which would logically come under his direction. Regular meetings of the staff would be held at which opportunity would be afforded for a discussion of important problems. Detailed minutes of the proceedings would be kept and periodical progress reports would be submitted to the management.

Although considerable time would probably be consumed in reaching a decision as to governing principles, in outlining distinctly the methods to be followed and in definitely planning the details, yet the work, when once organized, could be carried out more expeditiously than by a corps of experts who must of necessity spend considerable time in drawing upon the fund of information of the company's employees. It must be borne in mind also that in any appraisal by professionals the company must co-operate in no small degree, and the placing of data in their hands entails no trifling expense.

It may be true, also, as has been frequently stated, that departmental heads show comparatively little interest in the work of outside appraisers, with the consequence that there is a lack of understanding as to methods pursued, and the progress of the work not being closely followed dissenting views are not expressed until the final results are presented. Then arise questions as to the conclusions reached, and much effort is subsequently expended to make such corrections, modifications and additions as seem advisable and maybe essential. Such complications would be avoided to a large extent were the work directed by the company's valuation staff.

Of paramount importance is the foundation work connected with appraisals, that is, the inventory itself. Mr. Floy states that "nothing is more important than the inventory." In fact the whole valuation fails if the inventory is not complete and accurate. To make a proper and reliable inventory of a large property involves an amount of detail that will seem unduly laborious with an accompanying unwarranted expense to those inexperienced in appraisal work. Ordinarily it is the most difficult and expensive part of the work and will run from 50 to 75 per cent of the total cost of the appraisal. Under the committee plan of organization each departmental head will naturally assume the responsibility of completing an inventory of his own property. The general methods of conducting an inventory have been given in more or less detail heretofore and, of course, will have been considered by the valuation staff in general conferences before the work is started and while it is in progress.

As an illustration of a concrete instance where a company has itself undertaken the actual details of the work of an inventory of its property, we might quote from R. B. Rifenberick's description of the methods followed in Detroit:

"The track, mechanical and power departments are the ones which would have particularly to do with an inventory, as the physical property is in the direct charge of these departments. * * * Therefore the inventory was divided into the three general headings of inventory, track department; inventory, mechanical department; and inventory, power department, to which I added 'inventory general' to take care of real estate and buildings. * * * I concluded that the men who were in constant every-day connection with the property itself would be more capable than anyone whom I could secure from the outside, as such outside assistance could not possibly be as familiar with the property as must be the men in the regular employ of the company, who had in many cases been with the property for years. I took this subject up with each of the heads of the general departments and had them assign men out of their departments who were most familiar with the different schedules of the property to be inventoried, and they were put to work inventorying every item of physical property that they could ascertain. These men went into every schedule in as great detail as they could and were instructed to be sure and get everything that they could see and to be very careful not to put anything in their inventories that they could not at any time put their hands on and say 'There is that in the inventory'. * * *

"Our experience in this work fully confirms the conclusion I reached before getting up the organization for the purpose of taking the inventory, and I know of no better plan or organization that could be provided. * * *

"After arriving at material and labor cost * * * then should be added: (1) contingency item; (2) incidentals of construction item; (3) employers' and public liability insurance item; (4) builder's risk or casualty insurance; (5) architect's fee; (6) appreciation item; (7) acquiring land item; (8) contractor's profit item."

In addition, Mr. Rifenberick would include in the total reproduction cost overhead charges covering brokerage charge, discount on bonds, development cost, engineering charge, franchise value, going concern value, "hazard" charge, interest during construction charge, legal expense charge, organization and administration charge, promotion charge, taxes during construction charge and working capital charge.

Upon the completion of the inventory, the accounting and engineering departments must confer as to the value to be assigned to the various items. The operating department's knowledge of the present-day value and efficiency of the property also aids materially in reaching a right decision, while the purchasing department is called upon to furnish information as to past prices, details as to the circumstances under which the contracts for materials were made, etc. The accounting department is informed as to any unusual circumstances which may have attended the construction of the particular unit, all of which must be given weight in any equitable determination of its value. Thus no value appears on the inventory which cannot be substantiated by the company's records of cost are upheld by the experience of its engineers.

The legal department must be in close touch with the development of the valuation, and to it is relegated the preparation of evidence to establish a value upon the basis which has been adopted, also the rendering of opinions as to the value of easements, contracts, franchises and such other intangibles as may be involved.

When the original valuation has been finally completed, the problem of keeping it up to date arises. This means that as soon as any piece of construction is completed, the engineers and accountants must examine all the records of cost of that particular job and correct any errors or improper charging of labor, material or expense. The actual unit costs of the job must be determined and reconciled with previous estimates. Just as careful attention must be given to an accurate determination and record of the amount to be written off in reconstruction work. It is then a comparatively simple matter to bring the completed appraisal, as previously made, up to date each year.

PROBLEMS BEFORE STAFF

At the risk of some repetition, we here touch upon some of the practical problems to the proper solution of which the valuation staff, in conference, must give serious consideration. These involve:

1. Permanent inventory records. Where inventories are to be of value to the purchasing department, the operating department, the accounting department, and the valuation staff, the practical problem arises as to the most satisfactory form of inventory to serve such divers uses in a permanent manner.

2. Present-day and cost prices. There have been variations in the unit costs of construction since the company's property has been placed in operation and a study of these changes is essential. If the basis of prices is to be the reasonable cost of construction to the company, the question arises as to whether the company is not entitled in any fair appraisal to the difference between actual unit costs and those normally obtaining because of its superior bargaining ability and economical construction. If the basis of prices is to be the price of duplication, the question as to whether such prices should be present-day or average prices for an arbitrary period, such as the past five years, requires similar study.

3. The increased cost of piecemeal over completed construction. Properties built up part by part have not and could not be built with the same efficiency and economy that would be possible if the entire property were rebuilt, as a whole.

4. The increased cost of construction of property, such as track, while under operation, as compared with new construction without the difficulties of operation.

5. The inter-department charges making up the total cost of labor and material, including the cost of handling materials and stock and its transportation to the construction work, its incurrence while work is in process of construction, the cost of obtaining labor, the cost of employee's liability during construction, losses due to inclement weather and sickness, the cost of experimental work, and numerous similar problems, arising out of the diversity of construction conditions.

6. The overhead charges and their application; supervision of material and labor during construction and the inspection of the completed work prior to its being placed in operation.

7. The legal expenses involved during construction and the cost of money tied up in materials and supplies during the period of time which is needed to complete the work.

8. If the appraisal takes into account present, or depreciated, value of the property, the problems arising are numerous and involve the inspection of each unit of equipment and the determination of its remaining value as a part of the entire operating property.

The prime function of a valuation staff is to provide the company with an accurate and up-to-date appraisal, and while we may question the desirability of valuations in themselves, those who have given the subject deep consideration and have actual experience along this line point to certain incidental purposes which a valuation staff may serve. Aside from the features to which reference has already been made, as, for instance, the proper recording of costs, values, etc., involved in the reconstruction of the property as well as in its original installation, another important advantage is said to accrue, namely, the assistance which such a valuation staff can afford the legal department, particularly in cases where the question of reasonable return is involved.

It would also seem to be fair to assume that the contact of each department with every other as afforded by the committee form of valuation staff organization, is certain not only to broaden the viewpoint and make the employee of greater value to the company itself, but also to result in greater reliability of records where such a committee performs conscientiously its proper functions in checks and balances before the final figure enters into the property account of the company.

In conclusion, we reiterate the statement made early in this discussion, that we are facing definite conditions and not untried theories, in substantiation of which it might be well to call attention to an order of the Railroad Commission of the State of California that the electric railways within its jurisdiction file within 120 days inventory and appraisals of the cost and value of their property.

Finally, let it be understood that the object of this paper is not to provide an argument on the subject of valuation, but merely to cite certain attendant conditions of which the writer has some knowledge. There is, and perhaps always will be, honest differences of opinion as to the ultimate benefits to be derived from the application of the valuation theory.

ELEVATED RAILWAY TRAFFIC IN NEW YORK

The Public Service Commission of the First District of New York has just published the results of the operations of the four elevated lines of Manhattan and the Bronx for the year ending June 30, 1914. From this it appears that, although there was a considerable decrease on the Sixth Avenue line, there was, on the whole, an increase of 4,626,562 passengers carried for the year, and that the total number of passengers carried on the elevated lines during the year was 311,473,568. With these figures may be compared the record made by the subway for the same period. It carried 340,413,103 passengers, or 1,001,215 a day, which means that the Interborough system is used every day of the year by 1,917,315 passengers, or 651,886,671 in the year, counting 340 days to the year. Taking the four elevated lines separately, the Third Avenue carried 4,260,856 more passengers in 1914 than in 1913, a daily increase of 12,532, almost three times as heavy an increase as that of the preceding twelve months. The Sixth Avenue carried 497,248 fewer passengers than in 1913, and its record of 255,173 passengers a day was not only 1463 less than in 1913, but 721 less than in 1912. Both the Second Avenue and the Ninth Avenue lines gained moderately last year, the former scoring a 595,660 and the latter a 269,294 increase total over the preceding twelve months.

A red band or signal, which can be displayed diagonally across the illuminated route number on the front of the car, is being installed by the Philadelphia Rapid Transit Company to indicate when a car is destined to turn "short" of the usual run or is scheduled to go into a depot before reaching the end of the line. The cars of Routes 20, 21 and 53 have been equipped with this red band. The red band can be dropped into place by the motorman for the purpose of calling the attention of prospective passengers to the fact that the car is carrying a "short" destination sign immediately beneath the route number so that passengers may avoid boarding a car which is designated to turn before reaching the through terminal. If the new device proves to be a convenience to the traveling public it will be installed on all cars having the illuminated sign system.

REPORT OF THE SECRETARY-TREASURER OF THE AMERICAN ASSOCIATION *

The question of membership is always a vital one, and it is a pleasure to state that the growth of the association in this respect has been steady. We are slowly, but surely, gathering into the fold those companies which yet remain outside. It is interesting to note that our organizaion includes 36,000 of the 43,000 miles of electric railways in the United States and that of the $533,000,000 in revenues received by the companies in 1913, $500,000,000 were received by our member companies. This indicates that the association is truly representative of the electric railway industry of this country.

The individual membership has increased during the past year in a very satisfactory manner. This branch of membership is a potent factor for good and the recruiting should be aided in every possible way by every individual connected with the organization. The individual members should number many thousands.

The company section movement continues to spread. Two new sections were formed during the year, the Washington Railway & Electric Company section and the Manila Electric Railway & Light Company section, and two others are in process of formation. The organization of company sections should be encouraged as a sure means of increasing this membership. The value of the company section is difficult to overestimate. Each of our larger member companies should have a section among its employees, and executives of these companies should lend their support to the movement.

CASH STATEMENT

RECEIPTS

(Fiscal year ended Sept. 30, 1914)

Cash in bank, Oct. 1, 1913		$5,012
Admission fees	$230	
Company annual dues	38,328	
Individual membership dues	13,810	
Interest on bank deposits	369	
Sale of annual reports	330	
Sale of rule books	322	
Sale of classifications	82	
Sale of pamphlets	24	
Sale of membership emblems	458	
Index bureau	1,531	
Miscellaneous	435	
Aera advertisements and cuts	6,367	
Aera subscriptions	241	
Sale of *Aera* binders	75	
Manufacturers' Association contribution to support of *Aera*	5,970	
Sale of Engineering Manual and binder	519	
Contribution to fare bureau	1,000	
Refund of petty cash	600	
Proportional share of convention reporting from ELECTRIC RAILWAY JOURNAL	344	
Checks redeposited	114	
Receipts during fiscal year ended Sept. 30, 1914		71,156
Total cash, including balance of Oct. 1, 1913		$76,168

EXPENDITURES

(Fiscal year ended Sept. 30, 1914)

Salaries	$12,362
Printing and stationery	2,976
Postage	1,807
Miscellaneous office expenses	490
Rent of office	3,073
Telephone, telegraph and messengers	690
Express, freight and cartage	1,286
Traveling expenses, secretary	254
Traveling expenses, executive committee	37
Traveling expenses, other committees	1,346
Miscellaneous general expenses	2,085
1913 convention	996
1914 convention	95
Publicity for 1913 Convention	200

New individual members			893
Total individual membership Sept. 30, 1914			2.898

The value of the association magazine, *Aera*, has been thoroughly demonstrated. Its circulation has increased with the increase in membership, and it is maintaining a standard befitting the official organ of this association. Mention should be made of the publicity work which is being accomplished through the magazine. Newspapers to the number of 1196 are supplied each month with clippings from *Aera*. By this means much enlightening information relative to the operation of electric railways is published throughout the country and the effect cannot help but be beneficial.

A noteworthy step was taken during the year in the establishment of the Bureau of Fare Research under the direction of the committee on cost of passenger transportation service. F. W. Doolittle was selected by the committee as the bureau's director and took charge some five months ago. He is eminently well qualified for the important work devolving upon the bureau.

The new method of distributing the proceedings, as authorized by the executive committee was put into operation for the first time this year. This plan has resulted in a considerable saving in the cost of printing and express charges, the total amount saved over last year being approximately $1,500.

---

* Abstract of report for the fiscal year ended Sept. 30, 1914, presented at the meeting of the American Association, Atlantic City, N. J., Oct. 13, 1914.

Another innovation this year was the association's Year Book. In this is presented in convenient form a great deal of information bearing on the organization and work of the association.

Still another departure, and a very important one in its value to the members of the association, was the publication of the Engineering Manual. This book contains all standards and recommendations adopted to date, together with much other important information. It has been favorably received and its usefulness to the electric railway man is established.

The bureau of information has at times this year been heavily taxed and it has been difficult to keep up with the many requests for information of one sort or another. There were received during the year about 325 requests for information on a large variety of subjects, which received attention at the hands of the bureau. It is satisfactory to note that this important feature of association work is being taken advantage of by a constantly increasing number of member companies. It is appropriate to acknowledge here the active co-operation on the part of member companies in the supplying of data in connection with the work of this bureau.

During the past year eighty-four committee meetings were held. Co-operation of our companies has likewise been given freely in response to requests for information from various committees in the course of their work.

I desire to express my earnest appreciation of the loyal support accorded me by the members of our office force. They have been at all times faithful to the association's work.

I also wish to express my appreciation of the assistance which has been extended to me during the year by my predecessor, H. C. Donecker, and of the whole-hearted support accorded me by the membership generally.

UNIVERSAL STANDARD BOILER SPECIFICATIONS

During the month of September the committee appointed by the American Society of Mechanical Engineers to prepare specifications for the construction and care of steam boilers held several meetings for the purpose of bringing out discussion on a proposed draft for the specification. Mention of the first of these meetings, which was held Sept. 15, was made in the Electric Railway Journal for Sept. 5. At this hearing numerous representative users of steam boilers spoke in favor of the general adoption of a single standard boiler code, and this attitude was heartily concurred in by representatives of the Babcock & Wilcox Company, the National Tubular Boiler Manufacturers' Association, the American Boiler Manufacturers' Association, and the National Association of Steam & Hot Water Fitters.

The technical part of the hearing was opened with a general discussion on the proposed code with special reference to the matters of license and inspection laws. A discussion upon safety valves occupied a considerable portion of the afternoon but this was finally discontinued to enable a delegation from the National Association of Thresher Manufacturers to be heard. Following this, a committee of the American Society of Heating and Ventilating Engineers was heard, and then the meeting was thrown open to the discussion of the question of boiler material. This discussion was continued without recess until the adjournment at 8.30 p. m.

A committee composed of the representatives of the American Boiler Manufacturers' Association and the National Tubular Boiler Manufacturers' Association conducted a private meeting that lasted throughout the day of Sept. 16. In this the preliminary report was discussed from all standpoints and very carefully considered for its application to the boiler manufacturing industry. The result of their work was a comment on the specification for boiler material suggested by the Association of American Steel Manufacturers, some further criticism of the details of the report and finally the formation of a permanent organization for the purpose of taking definite action for the introduction of the code, after its acceptance by the society, into the legislatures of the various states. This meeting was finally adjourned until Tuesday, Sept. 29, on which date a general meeting of boiler manufacturers was called at Pittsburgh, Pa., for the purpose of furthering the work initiated in New York.

On Sept. 26 the committee representing the boiler-tube interests met in a second conference with the boiler specifications committee and presented a complete specification that is proposed for boiler tubes, both lap welded and seamless. A representative of the National Association of Master Steam and Hot Water Fitters appeared before the committee and expressed the approval of that association of the committee's work and particularly the changes recommended by the National Boiler & Radiator Manufacturers' Association and the American Society of Heating & Ventilating Engineers. Following this, conferences were held with representatives of the railroad associations and the safety valve manufacturers, both of which were, however, adjourned to later dates at which specific recommendations yet to be formulated will be presented.

BERLIN TRAFFIC LOSSES ON ACCOUNT OF WAR

That the effect of the war is beginning to make itself felt in Germany is shown by the August statements of the Berlin rapid transit and surface companies. The Berlin Elevated & Underground Railway Company (exclusive of the Schöneberg, Wilmersdorf and Dahlem municipal leased lines) carried 4,951,792 passengers in August of this year, compared with 5,610,011 for the same month in 1913. There was a corresponding reduction in revenue during the month from $184,993 to $160,541. This company recently turned over to the army sixty auto buses which it had just purchased for feeder service.

The August revenue of the Allgemeine Berlin Omnibus Company decreased from $276,294 to $213,540. One reason for the reduction is that the number of vehicles was cut down two-thirds because many buses and horses were taken for war purposes.

The report of the Grosse Berliner Strassenbahn shows a loss of about $75,000 compared with August, 1913, when the earnings were $913,849. The company not only lost a large number of regular riders but made a further sacrifice in voluntarily refunding credits for the unexpired commutation of all patrons called to the colors. Immediately after mobilization many women from the families of employees took their places, but this condition was temporary as men are now being trained to enter the service at regular wages.

The annual report of the Singapore Electric Tramways & Power Company for 1913 presents "for the first time a balance on the right side," the year's profits having been $45,672. The tramway has 15 miles of track, and carried more than 16,00,000 passengers last year, an increase of nearly 2,200,000 over the previous year. Receipts per carmile were 19 cents in 1913, against 17 cents in 1912. No dividend was paid, the concern having purchased at various discounts $260,843 of its own debentures, of which $163,513 have been canceled and $97,330 kept alive and carried as a credit. The capital now stands at $486,650. The chairman states that the company anticipates starting annual dividends next year.

HISTORICAL NOTES ON HORSE AND ELECTRIC CAR SERVICE IN ATLANTIC CITY

By George F. Faber, General Superintendent Atlantic City & Shore Railroad.

In view of the description of the new shops of the Atlantic City & Shore Railroad printed in the issue of the Electric Railway Journal for Oct. 10, the following historical notes may prove of interest.

The Camden & Atlantic Railroad Company was organized on June 24, 1852, and the construction of a railroad between Camden and the shore was begun a few weeks later. Tracks were laid on Atlantic Avenue in 1854. About 1865 two brothers secured from the railroad company the right to run cars on this avenue from the Inlet to South Carolina Avenue. The equipment comprised two cars and four horses, the owners acting as driver and conductor. After a short time their lease was taken over by another individual, but in 1869 the railroad refused to continue the lease and since that year has been operating the line.

In 1869 the Atlantic City Horse Car & Railway Company was organized and, after much difficulty, secured from the City Council the right to construct a line from a point on New Hampshire Avenue near the Inlet, in the center of that avenue to Atlantic Avenue, thence to Ohio Avenue, thence on Ohio Avenue to Pacific Avenue and on Pacific Avenue to the Excursion House at the foot of Missouri Avenue; also, from the intersection of Michigan and Pacific Avenues, via Michigan and Atlantic Avenues to Ohio Avenue, joining the other track at that point. The Camden & Atlantic Railroad, however, secured an injunction and stopped the construction on Atlantic Avenue and put an end to the enterprise excepting that the organization was continued.

In 1889 the electric trolley system was introduced and four years later the line was extended to Longport. Experiments with electric heating on the Burton system were begun in 1892, and the present, now known as the Consolidated, system was installed on a small scale in 1895 and completely in 1898.

The next venture in traction lines was the Atlantic City & Suburban Traction Company, organized in 1902 with a 33-year franchise. The company has a single track extending from the foot of Florida Avenue to the bridge across the Thoroughfare at Georgia Avenue, and thence across the Meadows to Pleasantville, Somer's Point and Absecon. Service on this line commenced in 1903.

The Central Passenger Railway Company secured a franchise for tracks on Virginia, Adriatic and South Carolina Avenues in 1903. After being held up by injunction the construction was completed on the first-named avenue only and the first car was operated the following year. It was planned to use the Pullen underground contact system on this line.

The above statements bring this historical sketch down to the year 1904. The more recent developments were covered in the Electric Railway Journal article already referred to. The property is now owned or controlled by the Pennsylvania Railroad through the West Jersey & Seashore Railroad, the direct owner of the larger portion of the property. The system is operated by the Atlantic City & Shore Railroad, which leases the rights of other companies having franchises and physical property in the city and immediate vicinity. The organization of the underlying companies are, however, maintained intact.

C. N. Duffy, vice-president and general manager Manila Electric Railroad & Light Company, was chairman of the arrangement committee at a reception given to Rev. J. J. Harty, archbishop of Manila, upon his return to the Philippine Islands on Aug. 3. The speakers at the reception included Governor General, Francis Burton Harrison and the Mayor of Manila.

BRILL'S LOW LEVEL HIGH-LIFE CARS ON RADIAL TRUCKS

The J. G. Brill Company is exhibiting one of the Third Avenue Railway Company's splendid low-level cars on the Boardwalk opposite the Pier, and electric railway men who want to see what conveniences can be incorporated in the once-despised "single-trucker" should not fail to go over it. Although this car is but 22 ft. 11½ in. over the corner posts and 34 ft. 11¾ in. over the buffers, it has a seating capacity of 46; thirty-seven passengers are accommodated in the body and nine on the platforms. There are no steps to the platforms as the height from pavement to patform is only 13 in.; from the platform to the car floor is 10½ in., and the floor of the car has a ramp of 3 in. in 5 ft. 1½ in. from the sill at each end. The car has a steel bottom frame and continuous steel posts; the sides are convertible, the arrangement being the "Third Avenue convertible system," which consists of panels with sashes interchangeable with wire screens.

The car is mounted on the Brill "Radiax" type of truck, which has a 10 ft. wheelbase and 24 in. wheels. The weight of the body, less electrical equipment, is 12,840 lb.; weight of truck, with two gears, 6140 lb.; the weight per seated passenger is 522 lb., and by lengthening the car 2 ft. 5 in., or one window, the weight per seated passenger will be 500 lb. The Brill Company has built forty-nine of these cars in two orders, all being mounted on "Radiax" trucks. A "Radiax" truck of 11 ft. 6 in. wheelbase is exhibited in the company's space on the pier.

SOME CONSOLIDATED LEADERS

The thermostat cabinets shown in operation by the Consolidated Car-Heating Company at space No. 22 demonstrated by graphic recording thermometer charts and by current consumption clocks the accuracy of temperature regulation and the economy in electric current which is effected by the use of this device. The thermostat employs the "Sylphon" flexible metallic bellows and is operated by the expansion of a liquid against atmospheric pressure. Break-down tests on both the thermostat and the magnetic switch controlled by the former show that they will operate more than 200,000 times without showing appreciable wear.

The electric heater features include the all-steel, lightweight construction with glazed porcelain, ventilated spindle for the coils which are made of the company's new non-corrosive wire "Nokoro." Fahnestock connectors for simplifying the wiring of the heaters are also employed. The company also shows an electric ventilating heater in which the outside air is blown by means of a fan over the resistance coils, and after being heated in this manner is distributed by means of a ventilating duct extending along the truss plank of the car. Another exhibit is a coal-burning type of ventilating unit. This heater is said to have absolutely no joints in the fire pot, the heater dome or the smoke jack nipple to permit the escape of coal gas. Fresh air to be heated is taken in by the fan either from the side or from the roof of the car, thus doing away with the objection of dust and odors which are drawn in when the air is taken through a hole in the car floor. The proportion of outside air can be regulated by a special damper according to temperature conditions.

One of the electric emergency trucks which the General Vehicle Company has supplied to both the New York and Third Avenue Railways has been installed for direct inspection at space 603 in company with ont of the company's 6-ft. industrial trucks. An idea of the various uses which an electric railway can make of the electric vehicle truck is obtainable from the company's reprint of the Electric Railway Journal's article of Sept. 5, 1914, on "Electric Motor Trucks for New York Railways."

THE LORAIN SWITCH THAT MISSED BRUSSELS

Probably the most interesting feature of the Lorain Steel Company's exhibit is a solid manganese steel tongue switch which was to have been a part of an order made for Brussels, Belgium. A portion of this order has gone forward, the exhibit being one of the pieces which could not be shipped on account of the European war. The design of this tongue provides a narrow tread which corresponds to a standard split switch. All the gage lines are straight, which is quite unusual in tongue-switch design. The tongue is of the tadpole type standard with this company. Recently however, certain parts of the tadpole design have been improved, particularly the holding-down device at the heel. Heretofore a special bronze bolt has been used for this purpose. In the improved device an ordinary track bolt has been substituted for the special bolt. While the bronze bolt was satisfactory it was too tempting as junk, which resulted in the removal of many of them from the piece in shipment. Slight changes have also been made in the tadpole switch lever and a yoke adjustment has also been applied. All of these improvements are shown and may be applied to any switch of the tadpole pattern now in use. One switch shown is equipped with a self-locking ground-throw mechanism which is provided with a spring to permit trailing movement. For the first time this company is showing the new 9 in. 134-lb. girder trilby section with the 150-lb guard, also a 7-in. 122-lb. girder trilby section with the 140-lb. guard as recently adopted by the American Electric Railway Engineering Association.

REMARKABLE TEST OF DOOR OPERATOR

At space 22 the Consolidated Car-Heating Company is continuing the breakdown test on its door operator. At the close of last year's convention the operator had performed 250,000 complete cycles of operation with no attention whatever. Then the exhibit was boxed, and this year the identical machine with no alterations, repairs or changes in any parts whatsoever, with the exception of lubricating the leather packing, is continuing this test. The remarkable feature is the small amount of wear shown by the machine. This fact, however, is explained by the company as being due to the babbitted crossheads and to the small bore, long stroke design of the door engine which gives an exceptional ease and flexibility of operation.

Various other types of door operators, especially the single-tube type which is being installed on the cars of the New York Municipal Railway, are also shown in operation in addition to a new type magnetic air valve employing needle valves instead of the rotary principle. These valves are unusually efficient, and will operate on as low as 9 electrical watts. Push-button switches for controlling the opening and closing of car doors are also shown.

WESTERN ELECTRIC HEADLIGHTS AND TELEPHONE DISPATCHING SYSTEM

The Western Electric Company is exhibiting for the first time at this convention the "Melobeam" headlight adapted for all classes of electric railway service. This headlight consists of a cast-iron frame fitted with a dustproof hinged door in which is fitted two lenses. The outer or front lens is of special construction and is known as the Spreadlite semaphore type which throws a wide beam of light across the tracks, enabling the motorman to see objects at a greater distance on either side. The inner lens, or doublet, is of amber colored Noglare glass which extracts all the violet rays from the light, thus removing the objectionable feature of white light when used in foggy or misty weather. A small spherical silvered glass reflector approximately 4 in. in diameter is set in the back of the case. The lamp socket of this headlight can be adjusted to bring the light center of any 23 to 100-watt concentrated filament Mazda lamp or any 23-watt to 56-watt regular Mazda lamp to the focal point of the reflectors. Several other types of standard arc headlights are also shown.

The company also exhibits this year a telephone dispatching system adapted for use on interurban lines. This system requires but one pair of wires for its operation and enables the dispatcher to call selectively any station along the line without ringing any of the others. At sidings or where no attendant is stationed there is a semaphore which automatically sets at danger as soon as the proper call is sent out over the line by the dispatcher and remains in that position until reset by the car crew after talking with the dispatcher.

Other exhibits are telephones and switchboards, composition and porcelain insulators, trolley wheels, bushings and harps insulating tapes and splicing compounds, line material, poles, car buzzers, fuses, Orangeburg fiber conduit and vacuum cleaners.

NATIONAL TUBE COMPANY SHOWS PANAMA-PACIFIC EXPOSITION STUNTS

The National Tube Company is exhibiting at spaces 554-557 a novel suite of furniture made of Shelby seamless tubing. This furniture, which has been made up for use at the Panama-Pacific Exposition, consists of one settee, one table and six chairs. These, together with the famous Shelby table top, impress every spectator with the variety of uses to which Shelby seamless tubing is adapted. Another exhibit for the Panama-Pacific Exposition is a rack of sectional specimens of Shelby trolley poles. Mounted on this is a complete trolley pole, including base, etc., and the tension is shown on a dial scale. This exhibit is attracting much favorable attention.

Living up to its reputation for exhibiting curious specimens of "National" products as taken from actual service the company is displaying several lengths of 8¼-in. "National" casing telescoped one within the other. This peculiar sample was obtained when a 1600-ft. string of this casing slipped from the elevators in an oil well and fell 200 feet to bedrock. The impact was terrific and resulted in three lengths of the same size casing telescoping one within the other. There is no trace of buckling nor opening at the weld. Aside from being a freak it is a remarkable demonstration of the quality of the steel used in "National" casing.

ADDITIONS TO THE LIST OF EXHIBITS

Acme Supply Company, Chicago, Ill., spaces 582, 583. Crown and Gem curtain fixtures, brass window sash, sash locks, Duplex weatherproof windows, Kass safety step treads, Regal revolving or hinged shade boxes, Chanarch steel flooring, friction roller curtains, safety step box, steel car doors, Acme weather stripping. Represented by Stanley W. Midgley, Roy C. Munro, John T. Morton.

Railway Materials Company, Chicago, Ill. Brakeshoes, Rymco high-speed automatic trolley switch. Represented by G. F. Allen, E. C. Folsom, I. B. Lesh.

National Carbon Company, Cleveland, Ohio. space 326. Fifty-four different grades of carbon brushes, carbon-graphite brushes, graphite brushes and metal-graphite brushes. Carbon of various types for headlights, flaming arcs, arc welding, etc., Duplex, multiple and other types of dry cells. Represented by F. D. Kathe, O. T. Weaver, E. H. Martindale.

The new attraction at spaces 376 and 379, the convention home of the Peter Smith Heater Company, is its new No. 1-S-C. magazine heater. This heater has been developed to meet the needs of interurban service, having a magazine of sufficient capacity to hold coal for a day's run. This heater will occupy floor space 22½ in. square, weighs 555 lb. and will heat cars ranging in length from 32 ft. to 45 ft.

NEW ACME SUPPLY PRODUCTS

Quite a number of new devices have been developed and are now on exhibit in spaces 582 and 583, where the Acme Supply Company and the Transportation Utilities Company are located. Among the newest features are the Crown and Gem curtain fixtures. The Acme Supply Company recently has gone into the business of curtain fixtures, including a pinch handle or compression curtain fixture and the Regal revolving or hinged shade boxes for side window curtains. The shade boxes permit free adjustment or curtain replacement and facilitate cleaning. They are made in two styles, a plain one for street cars and an ornamental box for interurban cars.

A light-weight and efficient type of safety step tread, known as the Kass safety step tread, is also shown. This is a punched steel tread which may be manufactured in any gage or shape. In fact, in may be formed to eliminate wooden treads, and at the same time is much lighter than other treads now in use. Other steel pressings shown are several styles of one-piece all-steel doors which were manufactured for the New York Municipal all-steel cars. The well-known Acme brass sash, which is now being generally used in all-steel car construction, is prominently displayed.

NEW MAYARI STEEL SERVICE TESTS

To demonstrate the extraordinary fiber stress values of Mayari steel the Pennsylvania Steel Company and the Maryland Steel Company are exhibiting this product under various serviceability tests. An 80-lb. A. S. C. E. rail-bound manganese steel center frog, bolted with Mayari chrome-nickel steel bolts which have been given a severe service test, is the center of attraction. This frog was installed in the yard of the company. As a draft of ingot cars was being taken through the turnout of which the frog was a part, a hook attached to a chain which was dragging along the track engaged one of the rail arms and bent it to an angle of 90 deg. The bolts held firm and no indication of fracture under this severe test appeared although the rail broke.

A vibratory testing machine employed to show the toughness of heat-treated Mayari steel under alternate stress or fatigue tests is also on exhibition. This alternate stress condition exists in the track bolts, in joints and connections, hence a very high elastic limit is desired. Heat-treated Mayari steel bolts in rail joints and frogs give the high elastic limit of 75,000 lb. per square inch.

Another feature in this exhibit is a test of a Mayari steel bolt under continuous tensile stress. For the purpose of the test a 1-in. bolt has been turned down to 5-32-in. diameter and then loaded with 2300 lb. of pig iron. This bolt was put under this test at the National Railway Appliances Association exhibition in Chicago last March and is shown again here without any evidence of elongation or that it has approximated its elastic limit.

EVER-SHARP STELLITE CUTTING TOOLS

Probably the most wonderful achievement of recent times in the metallurgical art is being shown by the Midvale Steel Company, and is known as Stellite. This wonderful new cutting metal which is not steel but an alloy of rare elements, contains characteristics which are revolutionizing machine-shop practice. Primarily it is intended to increase machine tool capacity or cutting speed 50 to 300 per cent. Its chief characteristic is abrasive hardness, and it is largely used as a cutting tool in lathes, since it is not adapted to planers or work which is subject to shock. Cutting tools made of Stellite are especially adapted in turning down commutators, since they may be run at extremely high speeds and do not require grinding. In an actual test a high-speed steel tool had to be ground after turning one commutator. A Stellite tool doing similar work turned four commutators without grinding, and at the close of the operation was in good condition. Moreover, this was true after the Stellite tool had run at a speed three times greater than had ever been attained in the shop where the test was made. A peculiar characteristic of this metal is that it has no temper and is cast in different shapes, namely, flats, squares and rounds, and ground to finish.

THE CARNEGIE EXHIBIT

In addition to the Carnegie Steel Company's exhibit of steel products it is showing special materials which are of vital interest to the street railway fraternity. It is making a special joint tie which is a combination of standard steel cross-tie sections fabricated in such a manner as to make a firm structure immediately under the joint. It is displaying a tie of this character to be used with concrete construction as well as ballasted construction, the only difference being the weight of the section which enters into its make-up. The company has specimen ties section M 28 weighing 28 lb. per foot, both insulated and non-insulated, similar to that being tested on the Pennsylvania Railroad. A new product in the shape of the Braddock insulated joint is being shown for the first time. Hanging in the space facing the Boardwalk is a very interesting set of photographs illustrating a special machine designed by Charles H. Clark of the Cleveland Railways for tearing up pavement preparatory to reconstruction. The carhouse name of this machine is a "rooter." Its record is 4500 ft. of pavement removed in twenty-eight minutes by four men, some "pork." This track was afterward laid with Carnegie steel cross-ties.

Rolled steel blanks from which motor gears are cut are also an interesting feature of the Carnegie exhibit. These blanks were brought out to replace castings which, owing to their nature, are not of sufficient strength and reliability to be used with the high-powered motors of to-day. The rolled steel blanks on exhibit are made from an ingot 22 in. x 22 in. and about 7 ft. long. The ingot is first rolled into a round of about 15-in. diameter, giving a reduction in the first mechanical treatment of about 60 per cent. After sufficient discard has been made to insure freedom from piping and undue segregation, this cylindrical bloom is cut into discs of the proper weight to produce the blank desired and is rolled in the same general way as a steel wheel into the blanks shown. The advantages of rolled steel gears are that they contain no hidden blow holes and that the metal has a fine grain owing to its mechanical treatment. The teeth on a finished gear are on the periphery of the disk so that there is very little variation of strength. Rolled gears are used almost exclusively on 75-hp motors and larger, and for difficult service are destined to replace castings.

This year the Railway Improvement Company is attracting considerable attention with its "Rico" terminal clock, which meets a long-felt requirement of modern railroading. This clock is installed at terminals or time points along the line and serves as a conductor's standard clock and at the same time gives an accurate printed record of the running time at these time points. In conjunction with this clock each motorman uses a daily card or envelope on which he automatically records his arrival and leaving time at all time points. These clocks are now in use on the Interborough Rapid Transit Company's lines, where the running time record envelope has been substituted for the daily time card. Another argument in favor of this clock is that on interurban lines it serves as a check on motormen who are inclined to turn back without going to the extreme end of the line. It is also asserted that to a great extent it eliminates the tendency to disregard orders for lay-over. This company is also exhibiting several types of its well-known Hedley anti-climbers and "Rico" sanitary straps.

IMPORTANCE OF BRAKE CYLINDER PISTON TRAVEL

Have you seen the machine gun in the Westinghouse booth? An exhibit of striking similarity in appearance to a rapid-fire machine gun is being shown by the Westinghouse Traction Brake Company to demonstrate the saving in operating expenses and improving the handling of cars in making stops, by insuring a proper and automatically adjusted piston travel.

The reasons why an efficient slack adjuster should be applied to every car are summed up in the following statements among others:

Prevents power being consumed by dragging brakeshoes.

Does away with shoe wear caused by shoes dragging upon the wheels.

Makes possible longer coasting periods, because brakeshoes clear the wheels.

Permits a higher schedule speed because of the decreased energy consumption.

Prevents loss of brakes on account of piston striking the cylinder head.

Saves time in making a stop.

Insures that the brakes will be promptly responsive to the motorman's intention.

Shortens the distance required for a stop.

Makes possible a higher maximum speed because a shorter stop can be secured.

Reduces the skill required of the motorman because of the uniform brake action.

When several cars are operated together, insures that all will be retarded uniformly.

Finally, proper piston travel is expensive and difficult to obtain. By means of the slack adjuster, it is obtained automatically, and in addition, the cost of maintenance and inspection is reduced, the trouble and annoyance resulting from improper slack adjustment are eliminated and the revenue car-miles made by the car between repair periods are increased.

A "SAFETY FIRST" SLIDING DOOR

The Prepayment Car Sales Company, in space 414, has on exhibit a sliding door that embodies several interesting features. It is designed to be used as a center door for interurban subway or elevated cars, although it can be used to equally good advantage at any point where a sliding door is desired. The door is equipped with the latest type pneumatic engine with electrically-controlled valve. All working parts of the engine are fully inclosed and packed with lubricant, which gives a splash lubrication during the operation of the door.

One of the most interesting features is the "safety shoe" which is mounted on the forward edge of the door. By means of this shoe the door can be closed on a crowd of children without danger of catching and hurting them. As soon as the shoe touches an obstruction it collapses on the door, reversing the operating air in the engine to make the door recede from the obstruction. As soon as the door is clear the shoe falls into place and the door again moves in a closing direction. If the obstruction has been moved the door closes at its normal speed. If the obstruction is still in the doorway the door again recedes. This is repeated until the doorway is clear to permit the door to close with safety. The advantage of this feature can be readily seen when it is borne in mind that usually the man operating the door is half a car length away from it. During rush hours it is generally found necessary to place a platform man at the center doors to assist passengers into the cars. Arrangements are provided whereby the platform man can close and lock the door by hand when the passengers are aboard.

ARMATURE BANDING MACHINE A FEATURE OF ELECTRIC SERVICE EXHIBIT

A universal armature banding machine is a new feature of the Electric Service Supplies Company at space 414. This machine embodies an important advantage over the ordinary method of treating armatures in avoiding the necessity of removing armatures from a separate lathe, because it constitutes a single piece of apparatus for winding, banding and painting armatures and for truing, slotting and grooving commutators. This company is displaying a new line of flatter and wider insulators of greater strength, mechanically and electrically, than its former high-pin type.

Another improvement has been made in the design of Garton-Daniels lightning arrester box, the opening door to which is now constructed with a hinge at the top of the box instead of at the side, as formerly. This arrangement, in case of a direct stroke of lightning, enables the hot gases produced within the box to escape more readily, without injuring the device. A high-frequency apparatus for artificially simulating a lightning disturbance is operated for those who desire to test the efficiency of the arresters. Still another innovation exhibited by the company is its "Melobeam" headlight, in which violet and ultra-violet rays are suppressed by means of an amber-colored glass lens, leaving only the rays of longer wave length, which penetrate better and without glare through fog, dust and darkness. This company is exhibiting its complete line of Keystone car destination signs in a novel way by means of a device which revolves the sign curtain, and makes it pause for a moment at each destination lettering.

GEAR TREATING AT THE NUTTALL PLANT

The R. D. Nuttall Company, showing at spaces 140, 142 and 144, for more than a quarter of a century has been supplying the railway trade with gears, pinions and trolleys. This company not only makes gearing for the railway field, but practically every gear application of the industrial world can be fulfilled in its extensive and complete plant.

The railway gear department is devoted exclusively to the cutting of gears and pinions for railway use. The heat treating department works in conjunction with this department, in that it receives gearing for heat treatment after having been cut. This heat treating department is fully equipped with heating furnaces which allow the heat to become gradually absorbed by the steel until it is of uniform temperature throughout. The pyrometers used for measuring temperatures are of the most improved type of water-cooled cold junction, rare metal couple. These are so constructed that if any one of them is out of order at all no temperature is recorded. This eliminates any slight discrepancies in the recording of the temperature. As an additional safeguard, however, these pyrometers are checked from time to time.

The quenching baths are large enough to permit continuous operation throughout the day without the loss of cooling efficiency. Several tanks of different solutions provide a good range of cooling mediums through which the desired rate of cooling can be obtained. Low temperature furnaces and drawback baths permit uniform tempering at any desired temperature. This insures a material of uniform hardness.

The heat treating department is under the constant supervision of an experienced metallurgist who works closely in touch with the research department toward the development of high-grade gears and pinions.

George Scott, of the Cleveland Fare Box Company, is attending the convention in the interest of his company. The company has no exhibit this year but Scott says the growing demand for locked fare boxes is such that his company will make an exhibit at future conventions.

Among the Exhibits

Easy and safe access to interurban cars is demonstrated by the folding step shown here for the first time by the Blake Car Step Works.

* * *

E. H. Hauserman, Cleveland representative of the G. Drouvé Company, arrived this morning to attend the convention. He is some baseball fan.

* * *

F. N. Root, of the Root Spring Scraper Company, arrived here Monday. He has no exhibit this year but is chuck full of efficiency talk about his six types of spring scrapers.

* * *

H. B. Logan, President of Dossert & Company, is attending the convention in the interest of Dossert cable connectors for electric railway power and substations. He is stopping at the Marlborough-Blenheim.

* * *

Jim Patton, of St. Louis, is reported to be carrying his arm in a sling. It is reliably reported that too frequent pushing of Pullman buttons often causes temporary paralysis, but of course this has nothing to do with Jim.

* * *

Tom K. Bell and E. Walter Jansen of the Atlantic Welding Company, New York, are here in the interests of an absolutely new method of electric rail welding. This method has met with remarkable success abroad and is now available to meet the most arduous conditions of American electric railway service.

* * *

Barnes & Kobert Manufacturing Company, Milldale, Conn., reserved space at the convention, but was unable to exhibit, largely on account of a rush of business for the fall season and the fact that it has recently moved into its new plant at Milldale, Conn., which it is now equipping with new machinery.

* * *

The interests of Arthur D. Little, Inc., Boston, Mass., are looked after at the convention by C. F. Woods, engineer of the Little laboratory. He is stopping at the Dennis. As chemists and engineers of tests this organization is rendering valuable service to a number of electric railway properties in the purchase of materials, from the coal pile to the track, line and car outfits.

* * *

The Manganese Steel Rail Company, New York, is represented at the convention by W. S. Potter and A. Aigeltinger, chief engineer and metallurgist of the company. This company has for some years marketed manganese steel T-rails to steam and electric railways. It is now preparing to manufacture girder manganese steel rails which will be ready for the market within the next three or four months.

* * *

The Pyrene Manufacturing Company had an opportunity to demonstrate the effectiveness of the Pyrene fire extinguisher Tuesday afternoon. A fire started in the exhibit of the Indianapolis Switch & Frog Company but, thanks to quick action and the extinguisher, the blaze was quenched before it had a chance to do any damage. "They're handy things to have around," says Mr. Maloney, the sales manager.

* * *

While the man who said "it can't be did" has been nursing his despair, the Westinghouse Traction Brake Company has gone ahead and done it. The problem of providing an automatic coupling of all control and other wires between cars has been worked out in a thoroughly practical manner. A complete equipment of automatic car and air coupler combined with the electric coupler is being demonstrated in the Westinghouse booth for the benefit of all convention visitors who may be interested.

The feature of the Railway Roller Bearing Company in space 134 is its Rollway oil-tight bearings for railway trucks and motors. The bearing has a fixed end-thrust adjustment and its main parts are reversible so that it is easily assembled on the axle through screwing all nuts tight. There is also displayed a model of solid roller-bearing, free-running wheels on a stationary axis, as well as models of roller-bearing shields, roller-bearing center-plates with cone-disked rollers and roller-bearing interchangeable journal boxes.

* * *

In space 507 in the Annex the Standard Paint Company, New York, is showing for the first time the "Imp" shingle for roofing. This shingle is made of the same composition as the well-known Rubberoid roofing, a non-brittle fire resisting material, with great toughness and strength estimated to last from two to three times as long as the best cedar shingle. The New York Central, Virginia Railway, and the C. C. & O., have recently completed installations on a number of new stations along their lines with "Imp" shingles. There is also exhibited a composition board for interior finish and decoration called "Amiwud." The board is shown in various finishes. Besides these, P. & B. insulating specialities are displayed.

* * *

The G. Drouvé Company, space 607, is again in the same location, the hotel men's annex, near the meeting halls of the American and Engineering Associations. Welcome is written on the mat and first aid service can be rendered to those desiring permanent fireproof and weatherproof ("Anti-Pluvius" puttyless) skylights. The "straight-push" sash operator meets the problem for the regulation of natural ventilation and is designed for difficult and unexpected service. Mr. Dee, Bridgeport, Conn., and Mr. Hauserman, Cleveland office, are in attendance, and when it comes to daylight and natural ventilation matters they have dozens of references to cite and "to help the man who wants to know and profits through the experience of others."

* * *

In addition to the exhibition of Nuttal standard railway material, including gears and pinions and trolleys, the R. D. Nuttall Company demonstrates the practical heat treating of steel as applied to its various grades of gears and pinions. In addition to this, it demonstrates the use of machines for determining the hardness, abrasive qualities and resistance to impact, with special machines for this purpose. It also shows the latest development in railway gearing, including flexible gears as used on the motor cars of the Pennsylvania Railroad electrification, Paoli Division. Further, it presents the latest developments in current collecting devices, including pantograph trolley, such as will be used on Pennsylvania electrification, and other types of pantograph current collectors for a. c. and d. c. electrifications.

* * *

In connection with its exhibit of electric railway overhead materials, rail bonds, third-rail insulators, car equipment devices and "Hi-Tension" insulators, the Ohio Brass Company, in spaces 358-365, is planning to have in continuous operation during the convention several tests and demonstrations of the various devices under working conditions. Electrical tests will be conducted on several different forms of strain insulators for electric railway circuits and also on the high-voltage transmission line insulators. Any who are interested in the study of insulating materials can undoubtedly acquire some valuable data at this booth. Tomlinson couplers and several other car equipment devices will be so demonstrated as to show clearly their behavior under operating conditions. The plan is to have something going on at the O-B booth at all times.

In space 18, Main building, the Flood & Conklin Company, Newark, N. J., is demonstrating the efficiency painting and varnishing of railway cars, in its Simplex one, two, three and four coat varnishing process.

* * *

The American Steel & Wire Company has a working exhibit which includes Ben Ryder and an electrically operated four-spindle motor drill for applying their twin-terminal bonds. An interesting feature of this drill is that it does not clamp to the track.

* * *

Ramapo Iron Works, of Hillburn, N. Y., is represented at the convention by James B. Strong. T-rail special work, electric and steam railway crossings, manganese frogs and switches and Ramapo patent safety switch stands for interurban service are manufactured by the company at Hillburn.

* * *

Henderson W. Knott ought to be happy because a representative of the Chicago Surface Lines has said that Morganite E-G-3 brushes, the highest priced and best brush that Knott sells, will hereafter be used on the surface line cars in Chicago, where there are more than 3500 of these cars. Hence Henderson's happiness.

* * *

Mr. Mason is representing his own interests, E. R. Mason Company, New York, at the convention. As Eastern representative of the Johnson Fare Box Company, Hunter Illuminated Car Sign Company and the Esterline Company, he is busy showing his railway customers and friends the exhibits of these companies on the pier.

* * *

The old hickory bower swing is just in the rear of the Drew Electric & Manufacturing Company exhibit of line supplies. James Drew is talking about the motorman's safety mirror, protective and reclaiming pole sleeves, Sampson pipe insulation for the prevention of electrolysis, Drew type trolley frogs and a lot more good overhead and line material. Walter Healy is here, too.

* * *

R. M. Campbell is present at the convention, representing the railway department of the Detroit Graphite Company. His headquarters are at 135 Broadway, New York. The Detroit Graphite Company is a maker of general paints for every purpose where paints are used. Mr. Campbell is concentrating on sales of paints for cars, trucks, poles, bridges, power-houses, stations, buildings, for electric and steam railways.

* * *

Forged manganese steel bolster and transom shifting plates, transom gibs and brakepins are the features in the Alloy Steel Forging Company's exhibit in space 569. Tests of these materials extending over one year are being conducted on twenty electric roads, but none have been completed because no parts have worn out or broken. The claims for this company's products are that they do not crumble and parts may be made much lighter with greatly increased life.

* * *

The Electro-Mechanical Brake Company, Ltd., West Bromwich, England, in space 610 is showing E M B unbreakable jointless grid resistances for traction and industrial use. These resistances, as recently described in the Electric Railway Journal, represent a great advance over ordinary cast types by reason of their jointless, rustless construction and other features. Specimens are displayed of the equipment used by the London County Council and the Birmingham, Adelaide and other electric railways.

* * *

The Index Visible, Inc., is displaying in space 523 a card system which is devised to eliminate all hunting through cabinets for cards. The cards are all placed in the index in plain sight with the keyword of each shown in the visible margin so that it is impossible to misfile a card. The flexibility of the system allows it to take care of 100,000 cards just as easily as of 1000. It is particularly adapted for use by electric railways in connection with subsidiary ledgers, stock records, cost records, purchasing agents' lists and payrolls.

* * *

The result of a remarkable gear and pinion service test is shown by the Joseph Dixon Crucible Company at exhibit space 16. This company is showing a half-section of a G. E. gear which has been in service continuously for the past six years on the Northampton, Easton & Washington Traction Company, and which was recently removed from a car after having made more than 300,000 miles; also a pinion, which has been in continuous service on the same road for five years and which made more than 250,000 miles. Dixon's graphite wood gear grease was the only lubricant ever used on these gears.

* * *

In space 314 Ernest H. Thompson is displaying an electrically operated fare box with an attached change-maker as an integral part. Six electrical connections are made through the base of the box, which is removable. The deposit of the exact fare is recorded on the totalizer and also by one hand of the overhead register, while the presentation of a transfer results in the conductor pressing a plunger to work another totalizer and to turn the other hand of the overhead register. The change-maker, the slot of which may be kept closed at the will of the conductor if desired, gives change for dimes, quarters, and half dollars directly to the customer. The object is to eliminate the conductor from the coin-handling process and to perform his fare collecting functions mechanically.

* * *

The Hale & Kilburn Company has a unique exhibit in the shape of a 40-ft. steel car interior equipped with its steel finish doors and seats, of the various standards used by the leading railways, thus affording the visiting officials opportunity to examine and test as in actual service in the car itself, the important features included in this company's product. One end of the car is equipped with its new steel transverse seating adopted for the New York Municipal Railway cars now under construction. The windows of the entire car open on the ocean, and a delightful view can be had while enjoying the very comfortable seats arranged opposite each car window. The exhibit has excited many favorable comments and it is referred to as the finest and most unusual ever seen at any convention.

* * *

In spaces 36 and 38 the Hunter Illuminated Car Sign Company, Flushing, N. Y., has a most extensive exhibit of illuminated car signs. Over the center of the aisle is suspended an illuminated sign operated by a motor. In this sign is a 30-ft. curtain with thirty-five destinations printed on it. The 175 new center-entrance cars on the New York Railways are equipped with this type of sign. A sign is also displayed similar to that furnished for the 125 new cars recently put into operation by the Municipal Railway of San Francisco. This is an open-front sign, so constructed that the curtain can be taken out as a unit, the curtain being interchangeable for other cars, whenever rerouting is necessary. There is also exhibited a route number sign of right-angle construction, one side of which faces the front of the car and the other the side of the car. In this are numbers from "1" to "99" printed on the curtain. The Pittsburgh Railways have 200 cars equipped with this type. One sample sign is shown of those furnished—four to a car—on the 228 new cars of the Chicago Railways. Also a twin-operated sign for the side of the car similar to those recently furnished to the Rhode Island Company, Providence, and the Bay State Railway, Boston. Other types of illuminated signs are also shown.

J. N. Johns Manufacturing Company, New York, is exhibiting bearings of all types, brush-holders, trolley wheels and other maintenance specialties.

* * *

Heywood Brothers & Wakefield Company are exhibiting in space 566, car seats with steel construction throughout, upholstered in rattan; light steel reversible seats with plush and wood cushions, and reed parlor car chairs.

* * *

Lefax loose-leaf engineering data, pocketbooks, filing boxes, blank sheets, and other specialties comprising the Lefax service are shown by the Standard Corporation at space 10c, in care of J. C. Parker, Bernard Dieckhaus and William C. Wells, Jr.

* * *

A full-sized car cable of unusual flexibility is the feature attraction of the exhibit of the John A. Roebling's Sons Company at spaces 17 and 19. The flexible quality of the cable is secured by lining it up like a regular cable, thus making it easy to handle and to install.

* * *

In space 319 the McQuay-Norris Manufacturing Company is showing a complete line of its well-known leak-proof piston rings. These rings are made in sizes from 1 in. to 34 in. in diameter. This company has recently moved into its new factory and is now better prepared than ever to make prompt deliveries.

* * *

Various styles and sizes of Penco culverts are on exhibit in space 108, occupied by the Penn Metal Company. The well-known merits of this company's culverts are that the metal is non-corrosive and that the shape of the culvert is designed to give a smooth bottom. This culvert pipe is furnished knock-down and the sections are bolted together at the point of installation.

* * *

The Acme Supply Company, Chicago, has become a full-fledged member of the Manufacturers' Association and now has a lot to say about several new car supplies, fittings and materials. Its products have been exhibited, as they are this year, with the Transportation Utilities Company, its Eastern agent. Several brand-new products ought to get a good reception by rolling stock engineers who are anxious to keep a little bit ahead of the procession. These new products include Regal revolving curtain box, Crown and Gem pinch handle curtain fixtures, Kass safety step treads and duplex weather-proof windows. There are a lot of other old reliable products to be seen, and also this company is showing full size metal doors and trims as built for the 200 New York Municipal subway cars.

* * *

Most everybody knows of Prest-o-lite. That is, every automobilist or motorcyclist does. And now many will see for the first time the application of the chief product of the Prest-o-lite Company to electric railway construction, operation and manufacturing industry. This company, a new member, has a working exhibit of welding and cutting. It shows portable oxy-acetylene outfits for shop, track and line use. A most convincing part of this display is a group of broken parts such as truck frames, journal boxes, motor housings, grids, etc., that have been welded. The oxy-acetylene process of applying rail bonds is also shown. Demonstrations of the cutting and welding of various metals will be made at frequent intervals. Among those in attendance are H. Sidney Smith, engineer, and S. D. Winger, railway salesman.

* * *

The Federal Signal Company at space 131 has several working signals and is making a particular feature of application to a.c. signaling. The light signal similar to that used in the Brooklyn Rapid Transit installation is shown in operation. The exhibit includes also an interurban signal of three-position, 4-A, bottom post type. In this the mechanism is entirely inclosed and room is allowed in the case for auxiliary apparatus, such as the track and line relays, terminals, lightning arresters, etc. This auxiliary apparatus is shown on separate racks, and in addition there are displayed a track transformer, single and polyphase relays, heavy reactance bond, etc. A standard Type 4, low-voltage universal signal is also shown. This type can be used either as top-post, bottom-post or dwarf signal.

* * *

A station coin register having features entirely new is shown by the International Register Company, spaces 300, 302 and 304. This machine was designed to meet conditions in the subway and elevated stations at Boston and eliminates the sale of tickets. The lower part looks like a ticket-chopper and receives in a hopper, 10-in. square, nickels, dimes or cents. These fall on a revolving cylinder, where they may be inspected by the attendant and are then automatically registered on a fare register mounted on a column above the machine. The registering mechanism is driven by an electric motor running continuously. Three thousand to 4000 fares per hour can be taken in one of these machines, at a large saving in the cost of tickets and the wages of ticket sellers. In its operation change is provided at a separate booth, where only a small percentage of passengers are received. Thus the time saved to the public in having exact change reduces change making to a minimum. These machines may be seen in operation in the new Boylston Street subway at Boston.

* * *

The Graphite Lubricating Company, oil-less bearing specialists, Bound Brook, N. J., are represented at the convention by George O. Smalley, assistant general manager. This company plans to make a change in the graphite insert of its trolley wheel bushings commencing Jan. 1, 1915. After that date all inserts will be made to form the words "Bound Brook," which is the trade mark of the company. The word "Bound" will be formed by the insert on one-half of the bushing, and the word "Brook" by the other half. This change will be inaugurated as a further protection for its customers and as a means of affording a definite way of knowing whether or not they are securing the genuine "Bound Brook" bushing. Advance samples of the revised bushing are shown in the booths of R. D. Nuttall Company, Electric Service Supplies Company, Sterling Fare Register Company, Star Brass Works, A. & J. M. Anderson Manufacturing Company, Western Electric Company, and the Bayonet Trolley Harp Company.

* * *

Charles N. Wood Company, Boston, is showing the Chapman automatic signal. In this signal all indications are given by a three-position semaphore arm (non-inclosed) and the method of operation is such as to prevent any misunderstanding of signals by the motorman. At night the indications are given the same as in the daytime, the arm being illuminated. Colored lenses may be attached to the semaphore arm if desired as in steam railroad practice. Only two line wires are required. This is a very important feature, as a multiplicity of line wires makes for an increase in line and signal troubles and adds greatly to the cost of installation, as well as maintenance. This is a car-counting signal, the counting mechanism being very simple and reliable, with few parts. Even if cars enter and leave the block at the same time a correct count in maintained. The signal indication given to allow a car to enter the block follows only after the actual operation of counting in the car has been completed. The lights to illuminate the arm at night are all independent local circuits and not connected with operating circuits, therefore any failure of light does not affect the operation of the signal.

The Cooper Heater Company, Carlisle, Pa., is showing its forced ventilation hot-air heaters and pressed steel hot-air heaters.

* * *

The Sterling Varnish Company, Pittsburgh, is exhibiting samples of insulating varnishes, impregnating compounds and iron enamel paints.

* * *

The National Car Wheel Company offers the Star Special, a chilled cast-iron car wheel of special design and special quality for city and interurban service.

* * *

S. Abrahams Company, Philadelphia, has a full line of uniforms and caps of all descriptions to make the electric railway employee spic and span as any man.

* * *

In Aquarium Court the Wilson Remover Company is demonstrating in a practical way the application and efficiency of its paint and varnish remover.

* * *

J. F. Decker, of the Auto Utilities Manufacturing Company, maker of the Peerless ventilator, is attending the convention but is not making an exhibit this year.

* * *

The Kerite Insulated Wire & Cable Company, in spaces 130 and 132, has on display various sizes of submarine, aerial and underground wire. The particular features are Kerite signal and high-tension wires.

* * *

An attractive reception room has been arranged by The Okonite Company in space 168. The company is exhibiting a varied assortment of Okonite wires and cables, Candee potheads and Okonite and Manson tapes.

* * *

P. Edw. Wisch, of the P. Edw. Wisch Service, New York, is attending the convention in the interest of his own business,—secret service work for street and interurban railways. He is stopping at the Marlborough-Blenheim.

* * *

The Dupont Fabrikoid Company has on exhibition Fabrikoid artificial leather as well as railway car seat upholstery and Fabrikoid car curtain material. These goods are shown in the loose form, and also on car seats upholstered with Fabrikoid as well as car curtain models.

* * *

The Buda Company's representatives, in space 311, are extending a cordial welcome to all visitors and incidentally have on exhibit models of this company's iron-bound bolted-down manganese insert special track work set in partially machined pockets. Also a number of large photographs of complicated layouts in various parts of the country are being shown.

* * *

The Wyoming Shovel Works are exhibiting Wyoming Mayari nickel chrome steel shovels, not alone track shovels but concrete shovels, scoops for power-house purposes, etc. The use of nickel chrome steel in shovels is so revolutionary that the claims made for it seem highly exaggerated, but the works have some elaborate testing machines in operation to prove the tremendous wear-resisting powers of the Wyoming Mayari shovels.

* * *

F. F. Stockwell, W. W. Field and F. H. Ellis of the Barbour Stockwell Company, Cambridge, Mass., together with a contingent of railway men arrived on Monday morning to attend the convention. Although the company has no exhibit, its representatives can tell you all about special track work manufactured of solid manganese steel, manganese insert work in steel and iron-bound or its well-known forged steel insert frogs and crossings.

The Standard Underground Cable Company at "The Sign of the Reel," space 388, is featuring "Standard Special Bronze (SSB) trolley wire," a trolley side feeder subway switch box, Colonial copper clad wire for guy wires, etc., and other products of particular interest to railway companies. Its exhibit also includes a complete showing of bare and weatherproof wires, lead-covered and armored cables, jointing materials, indoor and outdoor cable terminals and subway junction boxes.

* * *

The Rooke Automatic Register Company is exhibiting two cases containing fifty automatic collectors. These cases are similar to those in use on electric railways using Rooke registers. On the inside of the door of these cabinets are complete directions on how to use the register. The adaptability of these registers to take care of nickels, dimes and metal tickets is also being demonstrated. On one system about $5,500,000 is collected annually with Rooke registers without the loss of a fare. The company has lately equipped the Hazleton (Pa.) division of the Lehigh Valley Traction Company. The Hillside Transportation Company, Inc., Jamaica, N.Y., is also equipping its line with this register.

ARTICULATED CARS AT BOSTON

The Boston Elevated Railway began the use of articulated cars in 1912 in the belief that this method of construction would relieve the company from the drawbacks of operating rolling stock of small capacity on lines subject to a growing traffic. The type of car thus developed by John Lindall, superintendent of rolling stock and shops, has been thoroughly successful. Thirty-two articulated cars are now in service, and thirty-seven more are to be constructed in the near future, including six assembled from 25-ft. car bodies. Car bodies 20-ft. long have been utilized up to the present time in the formation of the complete articulated cars.

No complaints of importance regarding these cars have been received, boarding and alighting accidents have been greatly reduced by their use, and they have shown particular value in runs on short lines to and from terminals where quick loading without collection of fares by conductors is desirable. The step height of 14-in. above ground with a 6-in. step from the intermediate platform into the car body was provided to facilitate safe and convenient ingress and egress, this feature having been adopted many months before the question of step heights was taken up by the Public Service Commission of Massachusetts. The prepayment feature also has been found as valuable in these cars as in other types. In fact, as an economical means of utilizing good rolling stock whose capacity is fast being outgrown, the Boston articulated car is very successful.

The Department of Liberal Arts enjoys the distinction of having the first completely installed exhibit at the Panama-Pacific International Exposition. This is a "working exhibit" in the Palace of Liberal Arts by the Star Electric Company, Binghamton, N. Y., and forms the central fire and police alarm signal station for the entire exposition grounds.

A novel device for electrocuting rats was rigged up recently by the crew of the railroad station at Fort Wayne, Ind., where they believe in "doing it electrically." Not long ago rats entered the basement of the new station through the coal chute and gave trouble until the stationmen got together and constructed an electric chair especially designed for rats. The "chair" consists of an iron plate with a steel spike suspended above it, both the plate and spike being connected to the two wires of an electric circuit. With the spike baited with a piece of cheese, the rodents which venture upon the plate and reach upward complete an electrical circuit through their bodies and thus become their own circuit through their bodies.—*Electrical World.*

Electric Railway Journal

DAILY EDITION

Published at the Annual Conventions of the American Electric
Railway Association and Its Affiliated Associations

Copyright, 1914, by McGraw Publishing Company, Inc.

Vol. XLIV NEW YORK—THURSDAY, OCTOBER 15, 1914—ATLANTIC CITY NO. 15C

PROGRAM FOR TO-DAY

CONVENTION MEETINGS

9:30 a.m.	Joint Session of Accountants' with Engineering Association, Engineers' Hall, Convention Pier.
9:30 a.m.	Meeting of Claims Association, Claims Hall, Convention Pier.
9:30 a.m.	Meeting of Transportation & Traffic Association, Greek Temple, Convention Pier.
11:30 a.m.	Meeting of Accountants' Association, Accountants' Hall, Convention Pier.
11:30 a.m.	Meeting of Engineering Association, Engineers' Hall, Convention Pier.
2:00 p.m.	Meeting of American Association, Greek Temple, Convention Pier.

ENTERTAINMENT

10:00 a.m.	Obstacle Golf, Marlborough-Blenheim Lawn.
11:00 a.m.	Morning Concert by Engel's Orchestra, Lobby, Convention Pier.
3:00 p.m.	Afternoon Concert and Thé Dansant, Parisian Garden, Convention Pier.
4:00 p.m.	Obstacle Golf, Marlborough-Blenheim Lawn.
9:00 p.m.	Promenade Concert and Ball, Ball Room, Convention Pier.

The Report of the Committee on Public Relations

The long-awaited report of the committee on public relations was submitted yesterday and outlined a definite plan of action before the association. It cannot be put into operation too soon. For years the need of some general plan of publicity on the part of the association has been urged at conventions. It has been felt that if the public really knew what the companies were doing practically all hostility would disappear. Various suggestions have been made at past conventions, all good in their way, but there has been no earnest and systematic consideration of the entire subject. The committee yesterday came before the association with a co-ordinated plan of publicity involving five general methods, any one of which, or all of which, can be undertaken as the funds of the association permit. As a basis for all of these suggested plans the committee prepared a code of ten principles which, in its opinion, form the proper standard under which the general campaign is to be waged. Viewed in its entirety, the report of the public relations committee this year is the most constructive piece of work which has ever been presented to the association in the way of establishing the right kind of relations between the companies and the public. It is the fruition of effort covering a period of more than ten years on the part of a number of the members to have a comprehensive plan of this kind laid before the association. But a beginning only has been made. A program is of no value unless it is followed. The recognition of the necessity of action along these lines is spreading. Most railway companies now realize the desirability of taking the public into their confidence. What is true of individual properties is true of the industry as a whole. We hope that the adoption by the association yesterday of the report of the public relations committee will mean real co-operative publicity on the part of the association and of individual companies during the coming year.

The Code of Principles

In its code the committee followed the logical plan of placing the obligations which the companies owe the public before enumerating those which the members of the committee believe the public owes the companies. The code recognizes the necessity first of all of good service, and the first essential of service is safety. Unless an electric railway can furnish a service which is as safe as human skill and the financial ability of the company can make it, it has no excuse for existence. The quality of service in other respects, however, as well as its quantity, must necessarily depend upon the amount paid for transportation. This is self-evident. No company and no individual for any great length of time can pay out more than is taken in, and no amount of legislative enactment or commission rulings can ever make permanent the delivery of an article for less than its cost or secure a 5-cent service for a 3-cent fare. Following the declaration of the first principle in the code are nine others which we believe will commend themselves as a whole to the industry. These principles have been prepared with great care and thought by the sub-committee in charge of the drafting of the code and have been indorsed by the committee as a whole. In brief they describe the conditions under which electric railway companies can give the best service at the least cost, and they demand in return only a fair interest on a just capitalization under such conditions of full publicity that all conditions of operation and profits may be known to the public.

Joint Tenancy of Poles

The action of the American Electric Railway Association in accepting the recommendation of the committee on the joint use of poles that its report be received and made accessible to the membership gives recognition to splendid work which has been done by this committee since its appointment several years ago. At first glance it would seem like a simple thing to draw up an agreement and specifications under which two or more transmission interests could occupy a pole with due regard for the rights of each other. That this is not so is evident from an examination of the report, and a consideration of the fact that the present recommendations are the outcome of several years of study and many years of experience. The facts are that the question was one of the most serious, from an engineering standpoint, which has been taken up by the association because it required the harmonizing of the ideas of a number of conflicting interests. Perhaps to no other committee has been assigned as complicated a task, if we except the work of the present electrolysis committee, which is somewhat similar in scope. It is clear that joint tenancy should be the practice to the greatest possible extent from consideration of economy and of appearance. The problem is to provide such terms of agreement that the desired advantage can be gained with minimum risk to life and property. The companies operating weak-current circuits are naturally the ones most cautious in this matter because their wires ramify over the country so generally and into the homes of the people so intimately. Their apparatus also is very sensitive to interference. Hence it has not as yet been possible to secure agreement for joint use of poles with these companies where high voltage is involved. In other cases, however, the joint committee has been able to come to terms, and it deserves the gratitude and support of the several interests involved. It is for this kind of work that these national societies primarily exist. The acceptance of the report by the electric railway association is an important step in the movement. While the acceptance of the report does not bind anyone, companies contemplating joint pole tenancy would be short-sighted not to appropriate for their own use and at no cost the results of the arduous work which has been done.

Conventionalities

Anyone know a good wheeze on Nic Le Grand?

Where's this C. W. T. Ry's that has badge 4524?

W. H. Sauvage is here wearing his winter uniform, the same consisting of a flaming tie.

Don't you like Matt Brush's snappy method of running the T. & T. meetings? "Tis a vote!" Bang!

Did Ed Besuden tell you about his center-rear-entrance cars? We're not joking—the doors are in the center of the rear.

Edward Dana of the committee on rules and Mrs. Dana have, as their guest at the convention, Miss Bright of Boston. Must be great to be cultured and bright, too!

Tam Mather of Syracuse wants it clearly understood that he is a real native of ye banks and braes o' Bonnie Scotland (pronounced Scutland) and not a descendant from Cotton Mather.

The capable chairman of the equipment committee, F. R. Phillips, who has held that honor for so long that he can afford to joke about serious matters, seems to be the guy that put the quip in equipment.

We'd have given you the names of the winners in the Auction Bridge Tournament yesterday, except that H. N. Ransom is a charleyross after the game. Charleyross? That means ducked his nut.

Mr. and Mrs. G. A. Barden came all the way from Philadelphia for the convention and they are having such a good time that they hope the convention will stay for another week. Same here!

Senator C. L. Henry evidently believes in the good old American theory that a militant opposition is the safeguard of the nation. The Senator's humor, however, takes most of the sting out of his punches.

H. V. Drown at the Claims Association meeting yesterday claimed that there was no collision when a car struck a pedestrian. Guess he doesn't know Cyrus Ching of the Boston Elevated. We pity the car that hits Cyrus.

By Our Own Gellett Burgess

We never saw a purple cow
(We think the sight would kill one);
But there are purple trucks, we know,
Because we've lamped a Brill one.

The man behind the pocketbook at this convention is Wylie Brown, chairman of the finance committee of the Manufacturers' Association and no end of comment has been created by his skilful handling of funds and his many intricate schemes for benefiting the association. Wiles of Wylie, so to speak.

Henry Gulick, the Boardwalk inspector, picked up a jinx last spring when he moved to New York. First he broke his ankle, then his cook quit, then he got pneumonia and then the war broke out. But the first time he left the house in six months he found that the Middletown (Pa.) mills were working three shifts so that he thinks the effects of the hoodoo don't apply to other people.

A large number of Cornellians have registered for the luncheon to be held to-day in the Forest Room, Marlborough-Blenheim. Other names should be added promptly to the list in possession of Wylie Brown at the Manufacturers' Association office. Added starters, however, will be accepted up to 1 p. m. Men of other colleges will be welcome also. The price of the luncheon is $2 per copy.

This records our bet of two cigars with C. L. Cadle, the genial electrical engineer of the New York State Railways, that he will be operating his Rochester interurban lines on the signals alone, and without train. orders, within six months. Inasmuch as Mr. Cadle suggested this scheme himself eighteen months ago, we think this bet is like taking candy away from little children.

J. F. Layng did one turn around the floor at yesterday's fox-trot and then lost his breath completely. Perhaps the principles of the ventilated motor might be advantageously applied to his lungs, but we rather think instead that they ought to be removed from his feet, which appeared to suffer from excessive cold. At that, he's a pretty good fox-trotter.

Shortly after Wednesday's issue went to press the Washington Railway & Electric Company representatives reported the arrival of two additional members of their staff, bringing the total now in attendance upon the convention to eighteen. The latest arrivals are W. A. Wenner and H. G. Torbet. Can you beat it? The Washington Railway & Electric people insist that no hollow claims for the banner can be considered in the absence of a complete list of names.

The argument was so hot at the Engineering Association meeting this morning that the floor caught fire. Fact! It smouldered all afternoon and broke out violently at 6.30 p. m. last night, but four brave fire boys and two cops got after it with a hose and the engineers will be able to meet this morning. The damage to the building was negligible and the property loss would have been trifling if one of the cops had not lost his breath running to the fire.

Ernest Gonzenbach is registered as general manager of the Empire United Railways of Syracuse, but he is eligible for a number of the engineering associations, for the Diplomats' Club, the Authors' Society and a number of other equally diverse organizations. One of the first books which we ever published on electric railway construction bore his name on its back, and the contributions from his pen have appeared in several popular magazines. In fact, he has as wide a point of view as his native country, Switzerland.

Major H. C. Evans has undoubtedly a longer record in the way of attendance at electric railway conventions than anyone else here. This is the twenty-ninth consecutive convention at which he has been present, and he is regarded as the Nestor of the supply business. Major Evans joined the forces of the Lorain Steel Company thirty years ago this week, and in commemoration of this fact the sales organization of that company is to extend a dinner to him at the Bellevue-Stratford on Friday. Those who have been going to conventions for a great part of the time during the past twenty-five years say that the Major looks just as young now as he did when they first knew him. This is something of which he should be as proud as of his association record and the length of his connection with one company in the electric railway field.

The moving pictures, which were a feature of last evening's entertainment, were furnished through the courtesy of J. H. Van Brunt, director of safety education of the Public Service Railway and the other officials of that company, and it may be of interest to know that last night's reel, entitled "The Making of a Convert," was staged by the most famous movie dramatist in the profession. This reel has just been "released" by the Edison Company and sent to all moving picture exchanges throughout the world. To-morrow night the Public Service Railway will show a reel prepared by the Edison Company and entitled "The Life of a Motorman." It depicts the procedure followed by a motorman in securing a position, the subsequent education which is given to him, and finally the work which he does upon the platform and at terminals. The Public Service Railway certainly is to be congratulated upon the enterprise it has shown in the preparation of such moving pictures as these. Its courtesy in presenting the films before the delegates is greatly appreciated.

CLAIMS LARGEST DELEGATION FROM ANY POINT WITHIN SOLAR SYSTEM

In connection with the present close contest for the banner which is to be presented for the largest delegation to the convention, the Connecticut Company reports that it has not only a large attendance but a thoroughly representative one as well. Headed by L. S. Storrs, president, his secretary, R. E. Martin, and H. F. Hewett, manager, it should be noted that Auditor I. A. May and his general assistant, William Deegan, represent the accountants, while Chief Engineer of Power and Equipment P. W. Ripple, Assistant Engineer H. M. Gould, and Line Foremen G. S. Buttrick, George Pfuri and Joseph J. Brady do the same for the electrical engineers. Engineer W. R. Dunham, Jr., Assistant Engineer A. L. Donnelly and Roadmasters P. Ney Wilson and F. P. McKaig are in the track maintenance department, and Master Mechanics C. S. Symonds, E. E. Mott, H. J. Connelly, J. E. Dooley and W. F. McCoy, and Storekeepers C. A. Harris, F. C. Dunsmoor, W. J. Phelps, J. W. Ingman and L. McGrath represent the shops. The construction department has Construction Engineer Charles Rufus Harte and his chief clerk, H. B. White, Assistant Construction Engineer H. L. Bates and Assistant Engineer R. E. Eakin, and the transportation department is covered by M. G. Young, Superintendent Transportation W. J. Flickner, chief clerk to the president, bring the total up to twenty-nine delegates, with several others expected later. The Connecticut Company therefore claims the banner as having the largest delegation from any road south of the North Star, the above certified list proving the futility of all previous claims.

STILL ANOTHER CLAIMANT

The Boston Elevated delegation desires to announce loudly but emphatically that the Washington Elevated Railway & Electric Company delegation has no more chance for that banner for the largest attendance at the convention than had the proverbial wax dog that chased the asbestos rabbit through Hades. It is stated by no less an authority than M. C. Brush, himself, that the Boston Elevated delegation exceeds that from Washington by at least ten members, and that the pennant, gonfalon, or other means for signifying victory, should go to Boston, the land of the bean and the home of the Braves. Rival claimants who wish to dispute this claim should do so in writing, strongly supported by facts and figures. These, we understand, will be forthcoming later from the Boston crowd, the claim having been presented informally as Mr. Brush brushed through the Electric Railway Journal booth on his way to count up his delegation. He said it would take a long time owing to the enormous numbers involved.

A DELEGATE'S LETTER HOME

October the 14th, 1914.

My Dearest Rib:

This Day our Stint duly done, Master Barnes, my bully Companion, doth propose that we waste not ye Night in riotous Revel with Dancers of ye Trot of ye Fox but repair unto some Haven of more godly pleasure. "For," with seeming Wisdom, saith he, "Men of such Dignity as doth hedge a Master of Toll Roads do but ill to sort freely with the Mercers of Copper, of Iron and of Brazenry." Therefore, proposeth he that we hie unto one Master Keith, his Theater, forasmuch as he did quaintly phrase it: "They had a good Show."

Full well thou knowest, dearest Chuck, how I have ever for such Entertainment been but of a lukewarmish Stomach. Yet marry, thou knowest to thy Profit that it doth ever irk me to give a Nayword.

To the Playhouse then where we came in Season to miss ye Feats of two Men of Might; but for this, our Loss, we were soon thankful. Of the Doings in our Ken, surely the strangest were those of two Jacks who Master Keith did announce were singers. Yet whilst they did shout and run, never ventured they either Carol or Roundelay.

"My Ladye Gossip" the Stage doth take anon. It seemeth my Ladye long ago hath been wronged by Scandalmongers and now doth she piece out a scanty Pittance by scrivening Scandal about her Acquaintance. Methought the few bright Sayings did savour mostly of ye "School for Scandal" by Master Sheridan; but of this enough.

Came then some Troubadours with black Faces, and a Female who smirketh and singeth like unto Eva Tanguay ("I careth naught"), Eddie Foy, Harry Lauder, et cetera. Yet it seemeth but a poor Glory to mimick others as doth the Ape who mimicketh that which the Lord hath created in his own Image. At the last a Tango, which hath but little on ye Minuet, ye Sarabande and ye Gigue. Thence to ye Highway of Wood and unto ye Inne to Bedde.

Affectionately thine,

Obadiah.

AL GREEN ATTENDS HIS TWENTY-FIFTH CONVENTION

Time brings marked changes, and it was even so with our good friend Al Green of the Galena-Signal Oil Company who began attending street railway conventions twenty-five years ago. He was youthful and with as fine a head of hair as ever grew, when he first claimed membership. But now, poor Al belongs to the billiard-ball class, with but one lone hair to remind him of his verdant days. Hope endureth, however, and as a last resort, it is said, he will use a Galena lubricant as a hair restorer.

In commemoration of this most auspicious occasion, a number of his Galena friends presented him with a handsome rosewood cane, silver mounted and appropriately engraved. W. G. Gove, superintendent of equipment Brooklyn Rapid Transit, officiated. As usual, Al, or "Sunny Jim," as he is best known to his friends, was much surprised but responded in glowing terms and is more than ever proud of his record attendance from 1889 to 1914. He is now looking forward to the occasion of his passing the half century mark. When last seen he was on parade, and the new cane was most prominently displayed.

SKEE-BALL RECORDS AND PRIZES

The prizes given yesterday for the best skee-ball score were won by Mrs. T. W. Connette with 240 points and D. L. Clement with 290 points. The convention high scores to date are as follows:

Mrs. T. W. Connette...	240	C. G. Chamberlain.....	310
Mrs. W. E. Bryan......	200	T. M. Cluley..........	290
		D. L. Clement........	290

The number of games rolled to date has reached the total of 5500, an increase of 2250 for the day.

DINNER TO EDUCATORS

A dinner to the members of the committee on public relations and officers of the associations in attendance at the convention was given last night at the Marlborough-Blenheim Hotel by James H. McGraw in honor of the visiting educators. Among the educators in attendance were A. J. Rowland, dean of the engineering department Drexel Institute; Harold Pender, professor of electrical engineering University of Pennsylvania; James T. Rood, professor of electrical engineering University of Pennsylvania; V. Karapetoff, professor of electrical engineering Cornell University; W. E. Dickinson, professor of electrical engineering West Virginia University; H. B. Dates, professor of electrical engineering Case School of Applied Science, and W. I. Slichter, professor of electrical engineering Columbia University.

A CONDUCTOR'S LOT IS NOT A HAPPY ONE

(Perpetrated with the connivance of Gilbert and Sullivan's "Pirates of Penzance")

When a fellow's not engaged in his employment,
Or hanging 'round the carhouse schedule plans,
His capacity for innocent enjoyment
Is just as great as any other man's.
His feelings he with difficulty smothers
When heavy platform duty's to be done.
Taking one consideration with another
A conductor's lot is not a happy one.

When the ever-kicking rider ain't a-riding
When there's no one 'round to pass a pluggéd dime
He loves to hear the little brook a-gurgling
And listen to the merry village chime.
When his trip-sheet's true as anybody's mother
He loves to lie a-basking in the sun.
Yet, take one consideration with another
A conductor's lot is not a happy one.

RED CROSS WEEK

This is Red Cross week in Atlantic City. Anyone desiring to contribute to this fund, which is to be used by the Red Cross Society to furnish nurses and relief for the soldiers who are dying in Europe because of neglect after being wounded, will find a box in the booth of Miss Marvel, the official stenographer, at the left of the registration booth, for the reception of such contributions.

"ENGINEER OF GOOD-WILL"

Many of those in attendance at the convention may not realize that one of the prominent members of the association received a degree during the present week. This degree was conferred Tuesday evening on the popular third vice-president of the association, Charles L. Henry, president and general manager of the Indianapolis & Cincinnati Traction Company. In the form of a parchment diploma it granted to him the right during the rest of his life to the title of "Engineer of Good-Will." Those who presented the diploma were his fellow representatives of the American Electric Railway Association on the joint committee on the joint use of poles. The diploma was given in behalf of all the other members of that committee.

A story hangs on this function. When Mr. Henry was first appointed as one of the representatives of the association on this joint committee he demurred somewhat because he said he was not an engineer and believed that he could not be of much assistance for this reason. His well-known willingness to work for the association, however, led him to accept the office. The proceedings of the committee were naturally of a highly technical character, and Mr. Henry asserted on several occasions that he thought upon the conclusion of the work he would be entitled to an engineer's degree. His associates were of the same opinion and, without the knowledge of Mr. Henry, decided to award such a diploma. The degree itself is engrossed on parchment and at its head bears medallions showing the badges of the four interests represented on the committee, namely: the American Electric Railway Association, the American Institute of Electrical Engineers, the National Electric Light Association and the American Telephone & Telegraph Company.

The diploma reads as follows: "The National Committee on the Joint Use of Poles by this diploma declares that Charles Lewis Henry, loved by us all for his unfailing delightful personality, consummate tact, nice discernment and ready power of appreciating and doing that which is required, is hereby elected to the degree of 'Engineer of Good-Will,' and is entitled to all the rights, honors and privileges to that degree appertaining or otherwise within our power to bestow. Given at Atlantic City this thirteenth day of October, in the Year of our Lord, nineteen hundred and fourteen." The diploma is signed by all of the other members of the committee, namely: Messrs. Osgood, Thomas, Paine, Richey, Allen, Oviatt, Sproull, Bethel, Twining and Harvie.

LOST AND FOUND COLUMN

Found.—An initial watch fob has been found. Loser will please apply to Secretary McConnaughy at the office, Convention Pier.

CARNIVAL NIGHT A BIG SUCCESS

The carnival last night was a distinct success. Excitement was in evidence during the Kee-no and contest dances, reaching the highest pitch with the event of the evening in which Mlle. Mome and LeRoy Roberts who came direct from the Rose Garden in New York presented their "whirl-wind dance," followed by the thrilling "pony trot" in costume. This was received with great favor by those present and the applause was in keeping with the spirit of the evening. The contest dances brought out a number of couples and the large vote showed the interest in the popular dance. G. E. Chamberlin, chairman of the committee that had this feature in charge, is to be congratulated on the successful manner in which the evening's program was carried out. The first prize was won by Mr. S. S. Crane, general manager of the Altoona & Logan Valley Railway, and Mrs. Crane, the second by Miss Hazel Whitney and Mr. R. E. Rogers, and the third by Mrs. E. M. Walker and Mr. Jerry Stanton.

BLEEDER TURBINES IN COMBINED MANUFACTURING AND GENERATING PLANT

An effective method of apportioning the exhaust steam from the high-pressure stages of bleeder turbines to brine evaporators and the low-pressure stages of the same turbines is employed in a combined salt-manufacturing and electrical generating plant at Runcorn, England. Three 725-kw turbine-driven generators having the high-pressure and low-pressure stages separated by a diaphragm are used to supply electricity to plant pumps and to an electric-service system. When the generators are only partially loaded all of the exhaust steam from the high-pressure casings is utilized to heat the brine evaporators. At higher loads an automatic valve in the exhaust pipes allows the excess steam to flow through the low-pressure stages of the same turbines and thence to the condensers. By this arrangement all of the steam is used to the best advantage. The position of each steam-distributing valve is determined by the pressure in the main leading to the evaporators. If steam in excess of the amount required by the brine evaporators is discharged into the main, the pressure will rise, causing the steam-distributing valve to open ports feeding the low-pressure stages of the turbine.

F. W. Whitridge, president of the Third Avenue Railway, New York, who returned from Europe by the *Mauretania* recently, was asked: "What, in your opinion, led up to the European war?" Mr. Whitridge replied: "A gentleman in shining armor has stubbed his toe. In other words, he did not watch his step."

The following incomplete figures of revenues and operating expenses of carriers of the United States have just been made public by the Interstate Commerce Commission: Operating revenues, August, 1914, $261,662,484, against $273,725,097 in 1913; operating expenses, $175,844,653, against $188,550,834; net operating revenue, $85,317,831, against $85,174,263 in August, 1913.

The Metropolitan Street Railway, Kansas City, Mo., is reported to have sent out specifications for forty new cars.

YESTERDAY'S MEETING OF THE ACCOUNTANTS' ASSOCIATION

The meeting yesterday of the Accountants' Association was called to order in Accountants' Hall at 10:15 o'clock. An address on the subject of "Investment Bankers and Public Service Accountants," which is abstracted elsewhere in this issue, was delivered by H. S. Swift, West Penn Traction Company, Pittsburgh, Pa. Upon its conclusion a vote of thanks was tendered to Mr. Swift.

The report of the committee on overhead charges, which is also abstracted elsewhere in to-day's issue, was read by Secretary M. R. Boylan, Public Service Railway, Newark, N. J. F. H. Sillick, Hudson & Manhattan Railroad, New York, said that his company was required to work out some unique problems in apportioning the overhead charges for the Hudson Tunnels. Most electric railway construction is made for present traffic, but in the case of these tunnels provision had to be made for ultimate capacity from the outset. When the company began to operate only a portion of its tunnel system, it was necessary to utilize the construction done for its future traffic capacity. The company worked out a plan of apportioning the overhead charges according to the value of the property then in operation, but Mr. Sillick said that it was too big then to be described in detail. In conclusion he asked why the committee had dealt with overhead charges in connection with power houses only. Edwin Gruhl, The North American Company, New York, a member of the committee, replied that the report summarized all the available data. Track construction was continuous and complete statements of original construction costs for track were difficult to secure. Generally, such data had not been submitted, and the few statistics actually received could not be clearly subdivided under the headings of the report.

C. L. S. Tingley, American Railways, Philadelphia, Pa., mentioned some of the baffling conditions in connection with overhead charges that he had encountered in Ohio valuation work, and made a plea for the establishment of overhead percentages that might be used merely as a yardstick for measuring the guesses that had to be made for individual companies. Harold Almert, consulting engineer, Chicago, brought out the difference that exists between submitting to commissions data dealing with the plant equipment, labor and material costs and other purely physical aspects of the business, and presenting to them data concerning overhead charges and intangible elements. Certain advocates of the public and economists had been shrewd enough to pass the estimates of physical plant value as correct, knowing the availability of ample proof on this subject. In the matter of overhead charges and intangible elements, however, on account of the little thought on such subjects in the past and the large variations in percentages, these men had not hesitated to oppose company estimates. Moreover, new commissions had been too content to be guided by the older commissions, even looking upon former estimates as liberal or excessive. That this subject offered a great ground for investigation was shown by the fact that the Wisconsin commission allowed 12 per cent for overhead charges on electrical property, while independent investigators had found overhead charges as high as 40 per cent, or 60 per cent, including intangible values. Mr. Albert commented upon the opportunities of the remark made by Hon. Frank W. Stevens, chairman valuation committee, New York Central Lines, before the American Association on Tuesday to the effect that all overhead charges legitimately incurred should be included in the cost of construction.

P. L. King, San Antonio (Tex.) Traction Company, stated that his company was adding this year 20 per cent of the former value through construction and reconstruction, and asked what percentage of the executive officers' expenses should be charged to construction. Mr. Gruhl and President Glover replied that present Interstate Commerce Commission rulings permit a reasonable amount of such expenses to be charged if time is actually spent on construction work. Mr. Tingley moved that the report be accepted, that its recommendations be adopted and that the committee itself be continued and instructed to continue its studies with the idea of formulating broad, basic principles to show the proper process for calculating overhead charges. The motion was duly carried.

At this point J. F. Fogarty, The Milwaukee Electric Railway & Lighting Company, New York, delivered his address on the "Accounting Treatment of Bond Discount," which was followed by a vote of thanks moved by John J. Landers, York (Pa.) Railways. In view of the completeness of Mr. Fogarty's paper, several members expressed their inability to supplement it and the meeting of the Accountants Association was adjourned to give way for the joint session of the Claims Association and the Accountants' Association.

JOINT SESSION OF CLAIMS AND ACCOUNTANTS' ASSOCIATIONS

The joint session of the Claims Association and the Accountants' Association was called to order by President Glover of the latter association at 11:45 o'clock yesterday morning, with President W. F. Weh, Cleveland (Ohio) Railway, presiding for the Claims Association. Mr. Glover stated that the Accountants' executive committee had approved the continuation of the claims-accounting committee and he hoped that yearly meetings would be arranged between the two associations.

In the absence of H. J. Davies, Cleveland (Ohio) Railway, chairman of the claims-accounting committee, the report was read by H. K. Bennett, Fitchburg & Leominster Railway, Fitchburg, Mass. Mr. Bennett expressed his regret that Mr. Davies was not present, inasmuch as he had made the bulk of the investigation and had prepared both the original report presented to the committee in August and the later report placed before the association. The report is abstracted on another page of this issue.

Before the discussion began Mr. Kilfoyle and W. Tichenor, Terre Haute, Indianapolis & Eastern Traction Company, Indianapolis, Ind., took the places of Mr. Glover and Mr. Weh respectively as presiding officers. H. V. Drown, Public Service Railway, Newark, N. J., criticised the committee report as not being sufficiently elastic. He believed that a classification could be made that would be less disturbing to sub-classifications now used by the member companies, and he made various suggestions and criticisms with a view of establishing better coherence among the proposed accounts and clearing up alleged ambiguities. Mr. Drown filed with the secretary a classification of accident accounts formulated according to his views.

P. L. King, San Antonio (Tex.) Traction Company, believed that there should be headings for the shop and track departments. Mr. Bennett asked Mr. Drown if the suggested classification could not be used by the Public Service Railway without materially disturbing its general classification, but Mr. Drown averred that not only his company but also others could not comply with the new classification without a serious upsetting of their books and records. A. J. Jack, Wilmington & Philadelphia Traction Company, Wilmington, Del., raised a question concerning damages to company property, but Mr. Kilfoyle explained that under the new accounting rulings such expenses must be charged to the maintenance accounts.

Mr. Bennett next read some comments from Mr. Davies, to the effect that the report was merely a basis that would probably be modified by the two associations after discussion. Mr. Davies made some suggestions concerning the accounts and submitted various forms of reports that could be made up by the claims and accounting departments.

J. S. Harrison, Jacksonville (Fla.) Traction Company, said that in his state collisions with animals was an important item. B. B. Davis, Columbus Railway & Power Company, Columbus, Ohio, questioned the use of an account for employees' injuries in his state, where such injuries are by law necessarily handled by the Industrial Commission.

Chairman Tichenor suggested a motion to adopt, reject or recommit the claims-accounting report. L. F. Wynne, Georgia Railway & Power Company, Atlanta, Ga., moved that the report be recommitted to the same committee, that the association be circularized during the year and that the results of the new investigation be presented at next year's convention. E. P. Walsh, United Railways of St. Louis, made an amendment for immediate adoption and the use of the report in any desired modified form by individual companies. The amendment was lost and the motion of recommitment was carried.

The report on claims-accounting provided for the distribution among accident accounts of the cost of all accidents. To make an exact distribution possible the accounting officers of the committee prepared a classified list of accident department expenses, which was read by H. J. Jumonville, American Cities Company, New Orleans, La. The list showed main accounts that could be subdivided to suit the wishes of individual companies. Mr. Bennett stated that the Claims Association felt this matter to be one entirely concerning the Accountants' Association. Upon the motion of W. J. Meade, Cleveland (Ohio) Railway, seconded by H. B. Cavanaugh, Cleveland, Southwestern & Columbus Railway, Cleveland, Ohio, the report was adopted. The joint meeting was then adjourned.

WEDNESDAY MORNING SESSION TRANSPORTATION & TRAFFIC ASSOCIATION

The first order of business was the report of the express and freight committee which was made by Mr. Norviel, chairman. An abstract appears elsewhere in this issue.

Charles L. Henry said that his road was furnishing practically an express service at freight rates and was limited to this charge by franchises. His company has what it calls a station delivery express service transported on the passenger cars. This is separate and distinct from the service of the old line express companies which are now operating on nearly all interurban lines. Mr. Henry believed that the freight business could properly be undertaken by electric roads. They ought to develop all sources of income now that the passenger business was being affected by the automobiles. He thought it might take some time to get rid of the franchise restrictions which hampered some roads, but it must be done.

At this point a written discussion from H. B. Potter, assistant to the second vice-president of the Boston Elevated Railway, was read. It took the form of a constructive criticism of the committee's report, based upon Mr. Potter's experience in the handling of freight on the Boston Elevated. Briefly he found from the standpoint of a terminal company, which is the form in which the Boston Elevated handles freight, that up to the present this class of traffic had earned only a small net profit, when the comparatively large amount invested in terminals and track facilities was taken into consideration.

R. B. Stearns, Milwaukee, said that he understood that the federal government, through the department of public markets, was making an investigation to determine the causes leading up to the lack of development of interurban lines for handling farm produce and package express.

J. R. Harrigan, Kansas City, briefly described the extent to which his road went into the freight and express handling business. He felt sure that the bulk weight business would prove profitable. He also stated that since making an interchange contract with the Great Western Railway this business was being done according to Interstate Commerce Commission requirements.

C. T. Chapman, general freight and passenger agent Inter-Urban Railway, Des Moines, said that his road was in a general freight business with interchange relations with steam roads. In reply to an inquiry he stated that about 60 per cent of the company's gross income was from freight revenue.

F. W. Coen, Cleveland, and H. A. Nicholl, Anderson, Ind., took part in the discussion, each describing briefly his experience in handling freight.

Upon motion the report of the express and freight traffic committee with its recommendations was received and approved.

Following this President Brush called for the report of the committee on passenger traffic which was presented by the chairman, E. Soules, manager publicity department Illinois Traction System. Mr. Norviel presented a written discussion of passenger traffic report in which he expressed the opinion that the best means of retaining the present monopoly of traffic is perfection in the matter of safety and convenience, and in providing every luxury possible in equipment, and a roadbed beyond criticism.
